The intersex movement grew rapidly after activist Cheryl Chase founded the Intersex Society of North America (ISNA) in 1993. The organization came about inadvertently when Chase stated that she represented the then nonexistent group for credibility in a published response to biologist Anne Fausto-Sterling's article "The Five Sexes" in *The Sciences*. Chase received mail from intersex people from around the world who wanted to join ISNA, which led her to actually create the organization. ISNA provided bimonthly support groups and a newsletter, but it became best known for its protests against intersex surgeries at medical conferences and meetings.

The attention that the pickets received led to Chase's being invited to discuss the treatment of intersex bodies at the annual meeting of the Pediatric Endocrine Society in 2000. This collaboration that began at the conference ultimately led to a "Consensus Statement on Management of Intersex Disorders," which introduced the DSD language, recommended that a multidisciplinary team of experts be used to treat intersex bodies, and continued to endorse surgeries to "normalize" intersex variations. Many ISNA members did not agree with the consensus statement, and the resulting internal conflicts within the organization led to its demise in 2008.

The disbandment of ISNA resulted in the creation and growth of other intersex organizations in the United States that provided a variety of services and approaches to ending medically unnecessary procedures. Activism to raise awareness about the experiences of intersex people and change the standard medical practices also grew in Europe, Australia, and elsewhere, including South Africa, Mexico, and Nepal. An international intersex movement began to form with the establishment of Intersex Awareness Day, which was first celebrated in 2004. Held annually on October 26, Intersex Awareness Day has brought unprecedented attention in many countries to the "I" in "LGBTQIA."

The intersex rights movement was also bolstered by the 2017 publication of the groundbreaking report, "'I Want to Be Like Nature Made Me': Medically Unnecessary Surgeries on Intersex Children in the U.S.," by Human Rights Watch and the intersex youth organization interACT. The document shared the experiences of intersex youth, the parents of intersex children, and medical practitioners. It also included an analysis of the protocols for intersex surgeries and their consequences, a timeline of intersex activism, and recommendations to protect the rights of intersex people. Internationally, a number of institutions and organizations, including the World Health Organization, the United Nations Office of the High Commissioner for Human Rights, the Council of Europe, and Amnesty International, have called for an end to medically unnecessary intersex surgeries.

Nonbinary Recognition and Bans on Surgeries in the United States

Many intersex people identify as female or male, but their gender identity does not necessarily reflect the sex assignment forced on them by doctors and their parents. Other intersex people do not identify as either female or male; some see themselves as nonbinary or trans, and some want to be formally recognized as intersex. Several intersex people in the Unites States have successfully sued city and state agencies to have "intersex" listed on their birth certificates. But, more commonly, cities and states are accommodating intersex and nonbinary trans individuals by allowing them to have "X" as their gender marker on

legal documents. As of early 2021, 13 states enable individuals born in that state to have their birth certificates reissued with an "X" for gender instead of "F" or "M," and 19 states and Washington, D.C., permit this change on driver's licenses and state IDs.

Intersex activists and organizations have also sought legislation to ban doctors from performing medically unnecessary intersex surgeries. In the late 2010s, such laws were proposed in California, Nevada, and Texas. During hearings on the bills, intersex people shared their stories of being subjected to nonconsensual surgeries and how medical intervention did more harm than good, even when doctors got their sex assignment right. The bills received national media coverage, but none became law.

Still, even without formal bans, medically unnecessary surgeries on intersex infants in the United States are increasingly seen as controversial rather than considered sacrosanct. In 2017, three former surgeons general of the United States—Joycelyn Elders, David Satcher, and Richard Carmona—called for a rethinking of operations on intersex infants. Moreover, doctors and hospitals are increasingly unwilling to perform such surgeries, and a small but growing number of parents are refusing to allow the operations, saying it is up to their child to decide for themselves how their bodies should look and what their gender is.

Intimate Partner Violence

Intimate partner violence (IPV) is any physical, sexual, and/or psychological violence or harm done by a current or former romantic partner. It is recognized as a serious public health issue and is linked with numerous poor health outcomes. IPV is an issue that disproportionately affects trans people. Past-year IPV prevalence rates from large community-based studies in the United States show that trans people are up to six times more likely to experience IPV than cisgender (cis) women. This entry highlights the particular risk factors in the dominant culture that render trans people more vulnerable to IPV. It also examines the issue of partner abuse from both sides—including discussion of cases where trans people are victims as well as cases where they are perpetrators of IPV. To fully understand IPV in this context, an intersectional framework is required, to allow us to take both privileged and marginal aspects of identity into

account. This approach further takes into account the influences of both the dominant culture and relevant subcultures to which people belong. Trans people as mostly victims of IPV, but at times perpetrators of IPV, both affirms and troubles the dominant social narrative of IPV as relying on imbalances of power, illuminating the potency of identity abuse more broadly.

The Role of the Dominant Culture in IPV Against Trans People

Many trans people are in healthy, satisfying relationships. Where this is not the case, trans people are much more often victims than they are perpetrators of IPV, and this largely has to do with the degree of social exclusion they face. True of many marginalized groups, social exclusion keeps people from being able to fully participate in society, and this has an eroding impact on people's well-being.

The intrapersonal effects of social exclusion are captured by the *minority stress model*. This model details the added psychological burden in everyday life of managing the anxieties and traumas of systemic erasure, stigma, and interpersonal aggressions. This burden can contribute to poorer mental health and greater vulnerability to IPV. The systemic effects of exclusion are, in turn, captured by the *social determinants of health model*. This model reflects how economic and social factors, including experiences of discrimination, shape people's mental and physical health, as well as their access to care. As an example, even in places where national human rights protections for gender identity exist and universal health care is provided, research shows that trans people are medically underserved and have significantly more unmet health needs when compared with cis people. Patterns of underservice mean less access and connection to providers and services capable of helping with IPV.

In considering social exclusion with respect to trans communities, it is important to be mindful that identity is multidimensional and that gender identity is but one of these dimensions. Additional aspects of identity such as gender, race/ethnicity, class, and dis/ability may mean that people are navigating being multiply marginalized, and this will intensify their level of social exclusion and thus their risk for IPV.

Vulnerability Factors That Increase Risk of IPV by Cis Perpetrators Against Trans People

Research indicates that minority stresses and structural inequities elevate risk of IPV. Furthermore, research demonstrates that young trans women are at particularly high risk for IPV as compared to other trans subgroups, suggesting that multiple marginality further elevates risk.

Some small-scale studies also suggest that there are particular times during which trans people may be at elevated risk for IPV. These include when they disclose being trans to an existing partner and when they disclose plans to physically transition, both times of notable personal vulnerability for trans people.

Abuse Tactics Used by Cis Perpetrators Against Trans People

Research has shown that abusive partners often employ tactics that exploit trans people's vulnerabilities. In the late 1990s and early 2000s, the community organization FORGE did groundbreaking work in this area, articulating identity-based strategies often used against trans people, such as abusive partners misgendering them or touching off-limit parts of their bodies. Abusive partners may also attempt to discourage or interfere with transition-related treatments to control how partners present and embody their identities publicly or threaten to "out" someone to their workplace or landlord.

More nuanced abuse tactics may be employed, including the emotional manipulation of values and priorities that trans victims hold to inform their sense of self. For example, an abusive cis partner may use the knowledge that their trans partner highly values relationship stability, combined with their previous experiences of social losses and the threat of a diminished dating pool, as a way to keep the trans partner in the abusive relationship. Furthermore, there may be a deliberate amplification of a trans person's insecurities by overly focusing on their pretransition past or by suggesting their current looks or behavior to be inadequate for their gender. Thus, there are a variety of complex reasons why some trans people stay in abusive relationships.

Barriers to Help Seeking Among Trans Victims of IPV

There are few institutional supports or policies in place to assist trans victims wanting to protect themselves or to leave abusive relationships. Poor past or anticipated negative treatment by police and the prevalence of gender-based domestic violence services and shelters that are often not welcoming of trans clients are among the most frequently cited barriers. Other systemic issues may also play a role in whether trans people are able to protect themselves within and/or leave an abusive relationship. For example, owing to transphobia, a trans person may face a shrinking support network. Likewise, a trans person may face employment discrimination, resulting in less economic power to support themselves independently. When trans victims do reach out for help, it is generally for informal help from their existing social network. Many trans victims tell no one at all, and only a small fraction engages any formal IPV-related services (e.g., police or domestic abuse services).

Understanding the Role of Relevant Culture in IPV Perpetrated by Trans People Against Cis People

The dominant theoretical model for IPV assumes that social power is part of what enables abuse. This model fails to explain cases in which people with seemingly similar or greater social power are victimized. The existence of trans partners who perpetrate IPV against their cis partners affirms the importance of an intersectional analysis and highlights the role of culture in understanding what may enable abuse in these cases.

A chosen community with which one strongly identifies and feels aligned may be the greatest and most immediate sphere of influence or most relevant culture among the multiple cultures by which we are shaped. In cases of sexual minority, activist, and/or feminist circles, this culture may include priorities of having people from a marginalized group be the authority on their own experience and centering the voices of those most marginalized. Cultural values may also include using one's privilege in the dominant culture to demonstrate solidarity with and support those more marginalized. Holding these priorities can carry significant social currency connected to one's standing in, and belonging to, cultural communities. In cases of abuse, these values, which can inform a vital sense of one's identity, can be manipulated or distorted.

Vulnerabilities That Increase Risk of IPV by Trans Perpetrators Against Cis People

There are some conditions under which cis partners are particularly vulnerable to becoming victims of IPV. Research with queer women partners of trans men has shown that the narrative of social power underlying IPV delays recognition of their trans partner's behavior as abusive because their partner holds less social power. A first relationship with a trans man, in the absence of knowing other trans people, also represents a vulnerability to partner abuse. Cis women partners are more likely to defer to their trans partners in these cases, allowing them to define as normative behaviors that might minimize or dismiss violence, such as suggesting that maltreatment is a by-product of stress from the transphobia faced in the outside world.

Abuse Tactics Used by Trans Perpetrators Against Cis People

As discussed in the previous section, abusive tactics can involve the emotional manipulation of a partner's identity or moral character. In politicized subcultures, cis partners are invested in seeing themselves, and in others viewing them, as committed to social justice and, by extension, as a good trans ally. This can mean that cis partners unduly extend themselves or make compromises beyond their comfort in an effort to be supportive. Since concepts of who makes a good trans ally are most often defined by trans folks, trans partners hold a relative power that can be exploited. Abuse might arise in the form of a cis partner being instructed by their trans partner about what counts as supportive or nonsupportive behaviors. Moreover, some cis partners in prior research described being emotionally blackmailed into arrangements such as financing their trans partner's hormone therapy and blood work, with the threat that they would otherwise be named as

transphobic to others in their circle. These kinds of threats feel high stakes to cis partners in small communities from which they may fear being stigmatized or excluded.

There are also ways in which aspects of the dominant culture infuse subcultures that facilitate abuse. For example, there continues to be an expectation for women (or femmes) to do the bulk of the emotional labor in relationships, and they may internalize this expectation and take it up as a desired part of their identity. It follows that accusations of nonsupport by a trans partner may be particularly upsetting and/or motivating to do more or do better.

Barriers to Help Seeking Among Cis Women

Even when cis women understand their partner's behaviors to be abusive, they may continue these relationships for a period of time, sustained by a belief that these behaviors are temporary and attributable to gender role, poor coping with minority stress, or biology. The couple may co-construct any number of beliefs, including that trans men are stressed by transition and discrimination against them, are in pursuit of normalcy by asserting a stereotypical masculinity, are struggling with internalized transphobia, or are adapting to new and strong hormonal influences. These framings all function to diminish the personal responsibility of the trans partner. Interestingly, this diminishment of responsibility fits with traditional conceptualizations of IPV in heterosexual relationships, in which perpetrators often perceive and construct themselves as victims. In marginalized communities, this construction as victim is compelling because it reflects an aspect of reality; it is not entirely manufactured, even though the stories marshaled for the purpose of abuse are.

Cis partners may also be reluctant to seek help in cases where their trans partner has a high profile in their community, as they may worry about retribution or not being believed. They may also be reluctant to seek help when family or friends have not been supportive of the relationship, and they worry about reinforcing any existing prejudice against trans people in disclosing the abuse.

Understanding Both the Dominant and Relevant Cultures Together

The marginalized status of trans people is central both in the more prevalent relationship abuse against them and in the relationship abuse they perpetrate. IPV against trans victims may be understood in sociopolitical terms, whereby the cis partner exploits their greater social power and resources to abuse their trans partner. In politicized subcultures, trans perpetrators exploit the particular values and features of small communities to abuse their cis partner. IPV in both dominant and relevant cultures is joined by tactics that undermine relationally informed and valued aspects of a partner's identity. IPV points to the importance of appreciating the complexity of power and toward a context-based understanding of relationship violence.

J

Jenner, Caitlyn

Caitlyn Jenner is a U.S. media celebrity and, arguably, one of the most well-known trans people of the 21st century thus far. Jenner came out publicly as a trans woman in a television interview in 2015 and, following a short period of time out of the public eye, famously debuted her striking physical transformation in a glamorous cover-shoot for *Vanity Fair* magazine under the headline "Call Me Caitlyn." Jenner's significance as a subject of academic study relates to two central themes: her connection to the discourse of "authenticity" and her status as a highly visible member of a minority population.

From Athlete to Reality TV Star

Born on October 28, 1949, in Mount Kisco, New York, Jenner became a successful athlete in the 1970s, winning a gold medal for the male decathlon at the 1976 Olympic Games, for which she was widely hailed as an "American hero." Following her Olympic victory, Jenner was seen as one of the greatest athletes of her time, a status that enabled her to become a high-profile celebrity. In the late 1970s, she appeared on the covers of *Sports Illustrated, GQ,* and *Playgirl* magazines and was the spokesperson for Wheaties, with her photograph featuring on the cereal's boxes.

In the early 2010s, Jenner attained a different kind of media visibility as a member of the Kardashian family of reality television stars. She appeared regularly in the highly popular show *Keeping Up With the Kardashians* and a number of its spin-off series as the spouse to family matriarch Kris (whom Jenner married in 1991), parent to Kylie and Kendall Jenner, and stepparent to Kim, Courtney, and Khloe Kardashian, all of whom are highly visible media celebrities in their own rights. Following her transition, Jenner also starred in her own reality show, *I Am Cait,* broadcast on E! entertainment (the channel that runs all of the Kardashian shows), which claimed to represent Jenner's life in the immediate post coming-out period.

Media, Authenticity, and the Wrong Body Discourse

Jenner's background in reality television and her highly mediated coming out are important lenses through which to understand her significance as an object of academic study. For researchers working in media, cultural, and sexuality/gender studies, Jenner is not only important because she is a well-known trans person. Her many representations also allow us to understand why certain, quite specific, ideas about trans identity predominate in popular culture. These ideas have become *normative*—accepted and understood by many people. While the lived experiences of trans people are deeply varied, only a small number of discourses on trans life are normative in the mainstream media. Attention to the

representations of Jenner and other trans celebrities allows researchers to explore and understand the crucial role of media, in its many different forms, in shaping and circulating particular ideas about trans people.

Jenner's representations have been structured primarily by a discourse on trans identity that has been called the *wrong body discourse*. This is the idea that trans people experience their identities as an authentic, inner gender that is "trapped" inside a mismatched body. The wrong body discourse is often articulated through the statement that trans women, for example, are women born in men's bodies.

Jenner's representations exemplify how and why this discourse has become normative in contemporary popular culture. The types of media in which Jenner has primarily been represented, such as televised and magazine interviews, reality television, and her 2017 memoir, *The Secrets of My Life,* are all media that stake a claim to representing or revealing the "authentic" or "real" selves of individuals. In the case of Jenner's representations, her trans identity was put forward as the ultimate representation of her authentic self, one that she was making public for the first time. Through Jenner's representations, the wrong body discourse was able to make sense to mainstream media consumers because it correlated with the already familiar idea that everyone has a "true," authentic self.

The media's claims that Jenner was revealing her authentic self through coming out were tied in particular to her highly publicized physical transformation. This consisted of a large number of surgical "feminization" procedures, as well as the maintenance of an expensive wardrobe of fashionable clothes, long glossy hair, and expertly applied makeup. Much of the content of contemporary media, from advertising to makeover TV shows, circulates the idea that accessing and displaying one's authentic self is best achieved by maintaining a beautiful physical appearance. Jenner's coming out—represented visually through her glamorous physical transformation—was structured as a kind of grand makeover narrative. In this way, Jenner's media coming out represented her *trans* identity by drawing upon existing perceptions around the power of makeovers to bring out the authentic self.

Media Visibility for Minority Groups

Jenner is also significant to study because she exemplifies the complexities and contradictions around media visibility for minority groups, particularly in the case of celebrities. For many mainstream media consumers, celebrities and other media figures are their main points of contact with trans people and LGBTQIA+ people in general. These representations therefore play an important role in shaping popular perceptions of these minority populations.

Some hailed Jenner's coming out as a landmark achievement for trans visibility. *Glamour* magazine, for example, named her one of 2015's "Women of the Year." However, Jenner has never been an advocate for trans rights (at least initially, she was a supporter of Donald Trump), and in the interview accompanying her receipt of the award, Jenner was quoted as stating that "the hardest thing about being a woman" was "deciding what to wear." She also remarked that she was unconcerned about the pronouns people used to address her. Many commentators therefore argued that the immense privilege of Jenner's personal situation shielded her from many common forms of marginalization faced by the trans community in the United States. Jenner's privilege relates to her wealth, whiteness, and social connections, as well as her related ability to undergo a considerable number of surgical procedures concurrently. This privilege, it has been argued, makes her unrepresentative of the "average" trans person. Thus, Caitlyn Jenner has been a focal point for debates around the limits of trans visibility through celebrities.

Jennings, Jazz

Jazz Jennings, who was born on October 6, 2000, in South Florida, is a media celebrity and LGBTQIA+ rights activist. Jennings is notable for being one of the most visible representations of a young person identifying publicly as trans in the United States. From 2011 onward, Jennings and her family have appeared regularly in news stories, television interviews, documentaries, reality shows, and in magazines and online articles, in which Jennings's process of transitioning as a teenager was represented.

From a scholarly standpoint, Jazz Jennings is an important subject of inquiry because, as a media celebrity, she has worked to make the idea, or discourse, of the *trans child* recognizable for mainstream media consumers. Jennings is a significant object of academic study in relation to the cultural function of the trans child and her position within broader debates around the "truth" of gender in the 21st century.

Jazz Jennings's Celebrity

Jennings, who was assigned male at birth, was one of the first publicly documented cases of a child being identified as trans, having been medically diagnosed with gender dysphoria at the age of 5. In 2007, a 6-year-old Jazz and her parents, Jeanette and Greg Jennings (as they are known in the media; Jennings is a pseudonym), began appearing on television programs, discussing their experiences of raising a trans child. In 2011, the family was the focus of a TV documentary, *I Am Jazz: A Family in Transition,* broadcast on the Oprah Winfrey Network. Between 2011 and 2015, Jennings appeared in various media, including on her own YouTube channel, where she sought to raise awareness about issues facing trans children and teenagers. In particular, Jennings and her family discussed their long-running dispute with the U.S. Soccer Federation, which was refusing to allow Jennings to play for a girls' team. During this period, Jennings received numerous accolades and awards, including being named one of "The Most Influential Teens of 2014" by *Time* magazine. In 2015, the TV channel TLC premiered a reality series about the family, entitled *I Am Jazz,* which, as of 2020, is in its sixth season. Jennings's autobiography, *Being Jazz: My Life as a (Transgender) Teen,* was published in 2016, and in 2018, in an interview in *People* magazine, she publicly announced that she had undergone gender-affirming surgery, discussing her preparations for and the complications resulting from the surgery.

The Trans Child and Authenticity

The mainstream visibility of trans children has been a core component of a dramatic discursive shift in media representations of trans people in the 2010s, and Jennings is, arguably, the most visible representation of a trans child in early 21st-century North American society. Prior to this time, trans people, particularly trans women, tended to be represented as either comedic and ridiculous or sinister and deceptive, as, essentially, men pretending to be women. Through these representational tropes, trans women's female identities were constructed as performances, as a deliberate, although often unsuccessful, concealing of their "real" male identities.

In the 21st century, however, a different representational norm began to develop, one that became particularly pronounced in the 2010s. Scholars have called this alternative media discourse on trans people the "wrong-body discourse" because it maintains that trans identity constitutes an innate "true" gender trapped within a mismatched or "wrong" body. In this framework, trans women, for example, are female on the inside but are born trapped in male bodies.

Although published memoirs of trans individuals have articulated these kinds of experiences since the late 20th century, Jennings and the 21st-century media in which she has circulated (e.g., reality TV, YouTube, social media) have enabled the wrong-body discourse to attain mainstream recognizability and, in so doing, to consolidate the trans child as a cultural and media trope. That

Jennings has been represented primarily in reality TV, documentaries, news program interviews, and on social media is highly significant, as these are all types of media that claim to provide consumers with access to the "real" or "authentic" selves of their participants. In representing Jazz, these media have not only constructed her female identity as the location of her "authentic" self but have also pinned Jennings's own apparent awareness of her "true" female identity to when she was a young child, thus seeming to corroborate the idea that she has always been female "inside."

The Trans Child, Gender, and Cultural Fault Lines

The figure of the trans child, as embodied by a celebrity such as Jennings, speaks to the development of broader cultural fault lines in the present century around the location of "truth" in relation to gender and identity. One side of this fault line maintains that the truth of gender is something that you feel or know intangibly inside yourself. The other believes that truth of gender is a fixed and immutable biological fact. Thus, while many commentators have celebrated Jennings as someone who is living an authentic life according to her true identity, others have been deeply critical of her parents and the media corporations that have publicized them. These commentators have argued that Jennings, a minor until recently, only identifies as trans because adults have taught or encouraged her to feel this way. Thus, Jennings occupies an ambivalent position within complex cultural debates around not only the statuses of trans children and teenagers but also the very concept of gender and its changing meanings in the contemporary moment.

Jewish People

A common saying is "two Jews, three opinions," and this can be extrapolated to Jewish trans people, as there is no singular experience of being Jewish and trans. Jews encompass a diaspora of people from all over the world who share a Jewish identity and represent many races, ethnicities, nationalities, spiritual beliefs, and religious practices. No universally accepted definition of Jewish identity exists. While Jewishness is seen by some as a biologically rooted absolute, it is an individually self-defined identity to others. In one community, a Jew must have familial heritage and follow prescribed rituals, whereas another community might include converts to Judaism or atheist cultural Jews. This multiplicity of definitions has resonances with concepts of gender identity, including how trans can be defined narrowly or broadly. Jewish trans people's lives are affected by all of these perspectives on definitions of identity as well as their spiritual belief systems and the country in which they live.

Jewish Identities and Definitions

In the United States, there are a wide variety of Jewish beliefs and practices. Trans Jewish people are represented throughout Jewish life, although they are not accepted in some Jewish communities. Over the past few decades, trans Jewish people have created specific spaces for themselves along with new rituals and spiritual practices for trans people. Trans Jewish people have also taken leadership roles in modern spirituality. Efforts to include trans people in Jewish life are rooted in a wish for equality and tied to the Torah's recounting of subjugation of Jews and the more recent experiences of the Holocaust.

Jewish people may base their identity on religious beliefs, on being direct descendants of ancient Jews, more recent family roots, spiritual practices, or cultural identification. Some Jewish congregations include only those who have a matrilineal biological Jewish heritage, while others include any person who feels drawn to the community, including Jews by choice (those who convert) or non-Jewish parents raising Jewish children. In the United States, many people consider themselves culturally or ethnically Jewish in that they were raised in Jewish homes or have Jewish ancestors but may not participate in Jewish spiritual life. Jewish people may have a shared core of religious beliefs, while others see their connection to Judaism as a culture of ethnicity.

Modern Religious Jewish Views on Trans People

Current Jewish religious perspectives on trans people encompasses a breadth of views from celebrating and affirming to ostracizing and oppressing. There are a multitude of Jewish belief systems; in the United States, the major denominations, or movements, are Reform, Reconstructionist, and Conservative. These movements tend to be liberal, and in the 2010s, each took active stances to provide supportive spaces for trans Jews by passing resolutions for full inclusion and affirmation of all gender identities. All have also banned "conversion" therapy, which aims to "cure" LGBTQ+ people and is often rooted in strict religious beliefs.

Orthodox Jewish people are a diverse group that spans a spectrum of beliefs, values, and practices and is not an organized movement with cohesive stances on all issues—including trans Jews. Some Ultra-Orthodox Jews live and worship in distinct communities with high levels of religious proscription, while modern Orthodox Jews are less prescriptive, leading to the creation of some trans Orthodox organizations.

Strict Orthodox Judaism views sex as a fixed binary based on birth sex assignment. From infancy, there are assigned binary gender roles in all realms, including dress, education, work, leisure, religious involvement, and social interaction. Family, religious, and social roles are likewise strictly separated by gender; in many contexts, women and men do not speak to or touch one another. People with fluid or nonbinary gender identities are excluded from this structure, and there is no framework for transitioning from one sex to another. Some Orthodox religious leaders also advocate for "conversion" therapy for LGBTQ+ people.

Jewish Religious Texts on Trans People

Modern Jewish culture is based on a combination of religious texts and more recent spiritual rituals and practices. The ancient writings include the Torah (the Old Testament in Christian religions, or the Hebrew Bible), the Talmud, and classic rabbinic texts (sometimes collectively referred to as the Torah). The Torah has no direct representations of trans people, nor does it present gender as different from biological sex. The Torah presents only binary female/male sex based upon physical bodies. The exception is *saris* or eunuchs who may be intersex people or men who have been castrated. Parts of the Torah have long been invoked to condemn trans people. A passage in Deuteronomy is read as banning crossdressing, and a passage in Leviticus forbids body alteration, which is interpreted as prohibiting medical interventions to alter gender.

More recently, scholars have explored Jewish texts for indications of gender diversity. The Talmud and classic rabbinical texts include many complex explorations of gender. Adam was created as both genders and then split into female and male. Rebecca is referred to by both female and male pronouns. Sarah and Abraham are seen as nonbinary or perhaps intersex. Joseph is sometimes portrayed as having feminine attributes. Trans-affirming scholars often point to these examples to provide a Jewish context for gender fluidity and trans identities. Rabbi Elliot Kukla and other Jewish scholars have written about six gender classifications that appear in Jewish texts: *nekevah,* female; *zakhar,* male; *tumtum,* gender indeterminate; *androgynos,* both sexes; *saris,* eunuch or assigned male at birth and develop as female; and *aylonit,* assigned female at birth and develop as male.

The Experiences of Trans People in the Modern Jewish World

The world's first lesbian and gay synagogue, Beth Chayim Chadashim, was formed in Los Angeles in 1972, and since then, LGBTQ+ Jewish congregations have been established in many U.S. cities. Initially, LGBTQ+ rabbis could not be ordained, so LGBTQ+ allies played a key role in creating these congregations. Jewish congregations provide trans-affirming environments to help create social support for trans Jewish people in addition to offering a spiritual home.

Many Jewish congregations have made efforts to create welcoming environments for trans people, with some having selected trans leaders. Reform and Reconstructionist movements have been more welcoming of trans Jews since the 2000s. Women and men are not separated by gender, which creates space for nonbinary Jews. Thus, any adult may be counted as a member of a minyan (the minimum of 10 people needed to perform certain rituals by Jewish law), in contrast to some Orthodox communities, where only males can make a minyan. The Conservative movement at first accepted only binary trans people who had medically transitioned but are now more welcoming of all trans people.

Some Orthodox Jews argue that the Torah provides evidence that trans existence violates Jewish law. Trans people are prohibited from ordination as Orthodox rabbis. Some Orthodox Jewish towns and enclaves are relatively closed societies, interacting little with surrounding communities. Trans people growing up in these communities often keep their identity a secret from a young age. As adults, they continue to hide their identity—if discovered, religious leaders may expel them. Some primarily Orthodox towns have tried to be exempted from state laws prohibiting LGBTQ+ discrimination. However, a growing number of trans Orthodox groups are creating their own families, communities, and rituals.

Jewish Trans People's Impact on Language and Ritual

Jewish rituals are commonly in ancient languages, including Hebrew, which is a gendered language (i.e., all nouns have gendered endings). But rabbis and other Jewish leaders are inventing and using plural grammar to be more inclusive of trans people. More liberal Jewish communities seek to avoid misgendering people during religious rituals, many of which have female and male versions (or use female/male language). Scholarship in both the United States and Israel is creating and expanding Hebrew grammar to have a third gender.

Exciting new scholarship is also transforming Jewish rituals for trans children and adults, such as the bat mitzvah and bar mitzvah—the coming-of-age rituals that welcome 13-year-old female and male Jewish children, respectively, into adulthood. To be trans inclusive, Jewish people have renamed these rituals *b'nai* (plural) *mitzvah*, "b mitzvah," "they mitzvah," or "both mitzvah." Other life cycle rituals have been changed to include trans people through new translations, increased use of English, and more broadminded interpretations of traditional texts. New rituals and prayers have also been developed specifically for the life events of trans people, such as the use of a *mikvah* (ritual bath), which has traditionally has been associated with the new month, menstruation, and conversion to Judaism, to mark transitioning. Naming ceremonies, long used with newborns, have been adapted and reimagined for the gender and name changes of trans people.

Trans Jewish Rabbis and Religious Scholars

Few rabbis are out as trans. The first openly trans people ordained as rabbis were Elliot Kukla in 2006 and Reuben Zellman in 2010—both are trans men in the Reform movement; in 2003, Zellman was the first out trans person accepted to a Jewish rabbinical school. Kukla and Zellman have written extensively about Jewish trans experiences and trans affirmation within Jewish life and rituals. Emily Aviva Kapor, who had been ordained before coming out as trans, became the first openly trans woman rabbi after transitioning in 2013; Kapor is also hearing impaired and autistic. In 2014, Becky Silverstein became the first rabbi to be hired by a Conservative congregation. Ari Lev Fornari (ordained in 2014) and Leiah Moser (ordained in 2017) are trans rabbis in Reconstructionist synagogues. Samantha Zerin

may be the first trans spouse of a congregational rabbi; when she came out as trans in 2020, she could not find any others. Rona Matlow, a 22-year Navy veteran, says she may be the only openly trans rabbi who is a veteran, having been ordained before transitioning.

In 2008, Joy Ladin became the first openly trans employee of an Orthodox institution; she is a tenured English professor at Yeshiva University, one of the most important Jewish universities in the United States. Although Yeshiva was initially reluctant to retain her, Ladin returned to teaching after transitioning and was perhaps the first openly trans professor at any conservative religious university in the United States. Ladin is known for her poetry and memoir, *Through the Door of Life: A Jewish Journey Between Genders,* as well as for *The Soul of the Stranger: Reading God and Torah From a Transgender Perspective.* Another Jewish trans writer and educator, Abby Stein, is the first openly trans person raised in an Ultra-Orthodox Hasidic community (she is the direct descendant of Hasidic Judaism's founder) to be ordained as a rabbi. She came out as a woman of trans experience in 2015, and her memoir, *Becoming Eve,* was published in 2019.

Trans Jewish Cultural Figures

A number of Jewish people have made notable contributions to trans rights through using their public positions to further trans equality. The cis physicians Magnus Hirschfeld and Harry Benjamin were the most prominent medical voices in support of trans people in the early and mid-20th century. Kate Bornstein and Leslie Feinberg, who have authored foundational books on trans experiences, were both raised in Jewish households. Rachel Pollack has written frequently on trans issues, including trans characters in DC Comics. Jazz Jennings, who was one of the youngest publicly known trans people when she came out, has become a leading activist and educator through her reality television series. S. Bear Bergman is a writer and the founder of a press focused on feminist, LGBTQ-affirming, and racially diverse children's books. Sisters Lilly and Lana Wachowski are film and television directors best known for the *Matrix* series. Zach Barack is a successful actor (*Transparent, Spider-Man: Far From Home*). Hari Nef is also an actor (*Transparent*) and perhaps the first trans Jewish model signed by a major agency. Shachar Erez is the first openly trans Israeli soldier and had his medical costs covered by the military. Sharon Cohen, known professionally as Dana International, is an Israeli pop singer who won the Eurovision Song Contest in 1998. Amanda Simpson became the first openly trans individual to hold a position in the U.S. federal executive branch when she was appointed to the Commerce Department in 2009, and Raffi Freedman-Gurspan became the first openly trans White House staffer when she was hired by the Obama administration in 2015.

Transparent (2014–2019) was a TV show created by trans Jew Joey Soloway about a Jewish family with a trans parent of three adult children. Although both trans and Jewish identities are central to the story, the show did not offer a deep exploration of Jewish religious understandings of transness. However, *Transparent* featured a number of trans Jewish actors and writers.

Johnson, Marsha P.

Marsha P. Johnson (1945–1992) stood at the center of the gay liberation movement for nearly 25 years and was a central figure in the Stonewall Riots. Post Stonewall, she was a fierce and outspoken advocate for sex workers, prisoners, and people with HIV/AIDS. In addition, she worked against oppressive policing and mistreatment of the mentally ill, and she cofounded one of the country's first safe spaces for trans homeless youth. With best friend Sylvia Rivera, Johnson was a dynamic fixture of Greenwich Village, where she was called "the Mayor of Christopher Street." Johnson explained the origin of her name by saying the P. stood for "Pay it No Mind," a phrase she used to dismiss antagonists asking about her gender; Johnson was from the restaurant, Howard Johnson's. Johnson used she/her pronouns, and her primary identities were gay, transvestite, and drag queen.

Early Life

Johnson was born in Elizabeth, New Jersey, and grew up in a Christian religious household with six siblings. Johnson's father, Malcolm Michaels Sr., was an assembly line worker at General Motors, and her mother, Alberta Claiborne, was a housekeeper. Johnson began wearing feminine clothing at 5 years old, although harassment by neighborhood children ultimately stopped this practice. She was also sexually assaulted by a neighborhood kid. It was not until graduating from high school in 1963 and moving to New York City's Greenwich Village that she could freely express her true self. Johnson struggled with mental illness and substance abuse; she was arrested more than 100 times and frequently experienced police violence.

Stonewall Riots

Johnson was one of the first drag queens to frequent the Stonewall Inn once women and drag queens were allowed entry and was there on June 28, 1969. Whether fact or fable, Johnson was said to have thrown "the shot glass heard 'round the world"—that started the riot with the toss of a shot glass. It was recorded that she climbed a lamppost, however, and threw a heavy object that shattered a police car window. Johnson was a larger-than-life person with a friendly smile who engaged in witty repartee with everyone she encountered. Johnson's warm and generous nature drew attention from those she encountered—along with her distinctive look of wigs covered in fresh flowers and party lights, high-heeled shoes, and brightly colored dresses. Spending her last dollar on cookies that she handed out while walking down Christopher Street was a way of sharing hope and goodwill. Johnson was often thought of as a "Saint" and a "Mother" to disenfranchised people living on the street.

Activism After Stonewall

After Stonewall, Johnson participated in the Gay Liberation Front (GLF) and Gay Activists Alliance (GAA), taking part in the first Christopher Street Liberation Pride rally in June 1970. In September 1970, in response to the New York University's (NYU) discriminatory banning of all gay and lesbian functions on campus, Johnson and Rivera took part in a sit-in there. They also protested at Bellevue Hospital, which practiced shock therapy treatment on "homosexual" psychiatric patients, where Johnson was an occasional patient. Due to the marginalization of transvestites by GLF and GAA, Johnson and Rivera formed Street Transvestite Action Revolutionaries (STAR) in 1970, providing housing and support to LGBT youth living on the streets.

During the 1973 Pride March, Johnson and Rivera, along with all drag queens, were told to march at the back and be less visible because organizers wanted to present gays more prominently, on the grounds that they were seen as more palatable by the rest of the world. Johnson and Rivera refused to be shut out of a movement that they had fought in and defiantly marched ahead of people at the parade. Later, Johnson was active in the AIDS Coalition to Unleash Power (ACT UP), an organization founded in the 1980s. Johnson was diagnosed HIV+ in the early 1990s.

Johnson's Cultural and Artistic Influence

Known as "Black Marsha," she was a sought-after performer with the drag theater group Hot Peaches

(who performed from 1972–1990). In 1975, Andy Warhol had Johnson pose for him at The Factory. The series, called *Ladies and Gentleman,* featured drag queens and trans women of color. Johnson has been the subject of numerous art works, books, plays, documentaries, and films, including the 1995 play *The Ascension of Marsha P. Johnson,* the 2012 documentary *Pay It No Mind—The Life and Times of Marsha P. Johnson,* the 2017 documentary *The Death and Life of Marsha P. Johnson,* and the 2018 fictional short film *Happy Birthday, Marsha!* With Rivera, Johnson is featured in two children's books.

Johnson and fellow activist and friend Rivera are to be commemorated with the first transgender monuments near Stonewall at the end of 2021. A 7-acre waterfront park located along the East River in the Williamsburg neighborhood of Brooklyn has been named the Marsha P. Johnson State Park. Announced on what would have been Johnson's 75th birthday (August 24, 2020), a monument of her will be erected in her hometown of Elizabeth, New Jersey. This will be the first public monument in New Jersey to honor a LGBTQ+ person. The Marsha P. Johnson Institute is a nonprofit that helps Black trans people to advocate, organize, and heal from societal trauma.

Later Years and "Undetermined" Death

Between 1980 and 1992, Johnson lived with her friend Randy Wicker, who welcomed her when she was homeless. Johnson's body was found on July 6, 1992, in the Hudson River by the Christopher Street Piers a few days after the New York Pride March; the exact date of her death was not known. It was immediately ruled a suicide, and there was no investigation; her friends were convinced she would never end her own life. Wicker reported that before her death, Johnson was in poor physical and mental health; she sometimes hallucinated. Johnson had told people that she was being followed. According to friends, she sometimes wandered around the broken piers because she felt them to be a spiritual place. There were claims of someone at a bar bragging about killing a drag queen the night of the parade. After years of advocacy and urging, the NYPD changed the cause of death to "undetermined" in 2002 and reopened the case in 2012. The case remains unsolved to this day.

Jorgensen, Christine

Christine Jorgensen was an American ex-service member of Danish American heritage. When, in December 1952, reporters learned she had received medical treatments in Denmark to feminize her body and had changed her first name from George to Christine, news coverage was extensive, even hysterical. For the first time, the Western world was wakened to the possibility that sex was not permanent but might be subject to change.

Jorgensen was born in 1926 in the Bronx borough of New York City and grew up introverted and feminine in demeanor. She felt a psychological distance from boys while being frequently sexually

attracted to them. As she matured, she felt, as she put it, lost between the sexes and began to wish she were a girl. After graduating from high school, Jorgensen was drafted into the U.S. Army, just as World War II was drawing to a close. She was discharged in 1946 and afterward attended several colleges. She had an avid interest in photography and struggled to promote a travel film.

After reading about animal experiments conducted with newly synthesized human sex hormones, Jorgensen managed to talk a pharmacy clerk into giving her the female hormone ethinyl estradiol, which caused her body to become more feminine. When she found it impossible to obtain feminizing surgeries in the United States, Jorgensen traveled to Denmark, where she persuaded endocrinologist Christian Hamburger to accept her as a patient. She began electrolysis and continued estrogen therapy under medical supervision. In 1951, her penis, testicles, and scrotum were surgically removed. Fearing censure, Jorgensen's physicians were unwilling to construct a vagina. She later had vaginoplasty in the United States.

As Jorgensen was preparing to return to the United States, news of her change of sex (as it would be called) broke worldwide; it remains a mystery how the press got the news, as only her physicians, her family, and trusted friends knew of her medical treatments. On December 1, 1952, newspapers featured headlines like *New York Daily News*' "Ex-GI Becomes Blonde Beauty" and the Associated Press's "Bronx Boy Is Now a Girl." When she arrived in New York in 1953, she was mobbed by reporters, instantly becoming a celebrity. In her autobiography, she noted that her news coverage moved reports of the hydrogen bomb tests on Eniwetok Atoll to the inside pages of newspapers.

Jorgensen was followed by reporters throughout her life. Her romantic relationships came under immediate and intense news coverage and did not survive the scrutiny. She became, reluctantly at first, a spokesperson for trans people.

Jorgensen attempted to capitalize on her fame, using it to popularize the travel film she had made in Denmark. She sold her story to *American Weekly* magazine, which ran a five-part series in 1953, and she developed a nightclub act. She appeared on talk shows and at public gatherings and made audio recordings. She was met with both public admiration and public ridicule, and she met the latter with good grace. Jorgensen lived in New York State until 1967, when she relocated to California, where she lived until her death at age 62 of metastasized bladder cancer.

Jorgensen was not the first person to undergo gender affirmation surgery, but she captured the popular imagination and the attention of the media and medical communities. Not all reactions were positive, however. Psychiatrists who considered her desire to be a woman a form of mental illness called her medical treatment "collusion with delusion" and "collaboration with psychosis." There were many jokes about her. Eighteen years after her return to the United States, then Vice President Spiro Agnew called Senator Charles E. Goodell of New York, a critic of the Nixon administration, "The Christine Jorgensen of the Republican Party." When Jorgensen criticized Agnew's use of her name, he refused to apologize, claiming she had elected to place herself in the public domain.

It would be difficult to overestimate the impact of Jorgensen's gender affirmation surgery not only upon popular culture and the medical community but also upon those who, like her, questioned their own identities and appearances and saw, in news coverage about her, new possibilities for themselves. Jorgensen and her medical team received thousands of letters from often desperate people, begging to receive the same treatment. As a result, concerned physicians, including the endocrinologist Harry Benjamin, began to treat them cautiously with hormonal therapy and surgeries. They soon came to be called "transsexuals," a term Jorgensen disliked. Jorgensen preferred the name "transgender," a term that rose to prominence in the late 1900s.

Juvenile Justice System

Pervasive bias in their homes, schools, and communities jeopardizes the well-being of trans youth and increases their risk of contact with law enforcement and the justice system. Instead of protecting these youth from mistreatment, police, prosecutors, probation, and the courts routinely criminalize them. These dire circumstances are slowly improving. Professional awareness and understanding of gender identity have grown, in part due to emerging legal protections of transgender youth in caselaw and statute. These protections, in turn, have led to important systemic reforms, including adoption of nondiscrimination policies, staff training, and data collection and analysis.

Social Stigma and Associated Risks

Like all young people, trans youth need the support of family, friends, and community—a sense of "belonging"—to thrive and reach their full potential. Tragically, trans youth are often deprived of these basic supports, encountering rejection, harassment, and mistreatment in their homes, schools, faith communities, and health care settings. In a 2018 survey of 5,600 trans and gender-expansive youth, 84% of respondents had experienced verbal threats, 53% had experienced school bullying, 57% had been mocked or taunted by their families, and 16% had been sexually attacked or raped, all based on their actual or perceived gender identity. Faced with pervasive stigma and discrimination, trans youth experience high rates of school dropout or push-out, unstable housing, substance use, depression, and suicidality. Trans youth of color, who experience discrimination at the intersections of race and gender identity, are subjected to extraordinarily high rates of violence and victimization.

These risks are well documented and devastating, driving disproportionate numbers of trans youth into unsafe environments in which they are vulnerable to exploitation and negative health and mental health outcomes. Trans youth who are relegated to living on the streets often acquire criminal records for low-level offenses, including jumping subway turnstiles, urinating or defecating in public, or so-called survival crimes such as petty theft; trading sex for food, money, or shelter; or selling drugs. Whether or not trans youth are engaging in these behaviors, law enforcement often criminalizes trans youth—particularly trans girls. Their mere presence on the street prompts some police officers to arrest them for prostitution, a phenomenon known as "walking while trans." These same law enforcement officials fail to protect trans youth from exploitation and violence, blaming them for their own victimization and further jeopardizing their safety. These practices are reflected in the alarmingly high rates of violence against transgender youth and their significant overrepresentation in the youth justice system. According to recent national data, 12% of youth in detention facilities identify as transgender or gender nonconforming compared to approximately 0.7% of youth in the general population.

Structural Transphobia in the Juvenile Justice System

Compared with their cisgender (cis) peers, trans youth who are charged with law violations are more likely to be arrested than cited and more likely to be detained than diverted to alternative programs. Secure confinement is often the default response based solely on the lack of appropriate residential or nonresidential alternatives rather than a legitimate assessment of risk. Often, trans youth charged with nonviolent misdemeanors languish in detention even though they pose no threat to public safety. Consistent with the overall racial disparities in the youth justice system, most systems-involved trans youth are of color. The disparities experienced by youth of color at every stage of the legal process—from arrest through adjudication—are magnified for trans youth of color.

Transgender youth confined in detention or correctional settings experience pervasive mistreatment by facility staff and other youth, including sexual and physical abuse, particularly when

facilities lack clear enforceable guidance on how to protect their safety and promote their well-being. Faced with potential liability and inadequate housing options, staff often place trans youth in "protective isolation" as a means of ensuring their safety. Some trans youth are afraid to leave their rooms, forcing them to choose between isolation and abuse. Research documenting the serious physical and emotional harms to youth associated with isolation has prompted widespread reforms limiting its use. Nonetheless, these practices persist.

Facilities that do not isolate trans youth commonly house them in a unit that corresponds with their assigned sex. This practice can subject trans youth to untenable and potentially dangerous conditions. Girls who are openly or visibly trans are particularly at risk of being harmed. Assaults and bullying of these youth routinely occur in locked sleeping rooms, bathrooms and showers, and during strip or pat-down searches.

Detention and correctional staff often fail to intervene to protect trans youth from bullying or abuse by other youth. Many staff ignore transphobic behavior, and others suggest that trans youth should alter their appearance or mannerisms and hide their identities rather than holding other youth accountable for their behavior. Trans residents also report losing privileges or accruing additional time when they defend themselves against constant bullying. Staff implicitly or overtly identify gender conformity as the goal of "treatment," creating an objective that is as harmful as it is impossible to achieve. These conditions and practices create a perilous environment in which trans youth must navigate persistently negative messages about core aspects of their identity and constant threats to their safety and well-being. These conditions undermine their ability to meaningfully participate in rehabilitative and educational programming and prevent them from progressing and working toward release.

Detention and correctional facilities are rarely equipped to provide gender-affirming health or behavioral health care. Health services are typically provided by private contractors who are not familiar with the standards of care governing transgender health. These providers often consider transition-related care, such as the administration of cross-sex hormones, medically unnecessary or cosmetic. This structural bias is reinforced by custodial staff who view transgender status as manipulative or indicative of mental illness. Consequently, whether by explicit policy or accepted practice, trans youth are denied access to any transition-related care and told they must wait until they are released to seek care. These policies and practices have a devastating impact on the health and safety of trans youth, increasing their dysphoria and their risk of severe emotional distress and even suicide.

Reentry services that address the unique needs of each youth are a key strategy for promoting their future success and reintegration into their community. Regrettably, the services available to youth who are released from youth justice facilities rarely address the unique needs of trans youth. Many of these youth cannot safely return to their families, particularly if the agency has not engaged with families to explore supports that might empower them to understand and advocate for their child. When the probation agency fails to work closely with system and community partners to identify alternative placements with affirming relatives or foster families, these youth are relegated to group homes, couch surfing, or the streets. In addition to housing, transgender youth need access to gender-affirming health care, as well as sensitive behavioral health care to address the trauma and dysphoria they experience in custodial settings. They need to attend schools in which they can access educational facilities and opportunities without discrimination or exclusion. They need access to community settings in which they are embraced and affirmed, where they can socialize with their friends. Trans youth who exit the system without these critical supports experience poor health and social outcomes, further undermining their opportunities to successfully transition to adulthood.

Legal Protections and Systemic Reforms

Historically, neither courts nor legislatures acknowledged the existence or vulnerability of trans youth in the justice system nor the unique harms to which they are routinely subjected. In the early 2000s, at least one case recognized the constitutional rights of trans youth in the system, and federal regulations extended specific legal

protections to this population. These developments, in turn, increased awareness and launched important systemic reforms.

In 2006, *R.G. v. Koller* was the first published opinion to identify and remedy harms to youth in custody based solely on the youths' actual or perceived sexual orientation or gender identity. In *Koller,* the American Civil Liberties Union of Hawaii sued the Hawaii Youth Correctional Facility (HYCF) in federal court on behalf of R.G., an 18-year-old lesbian; J.D., a 17-year-old boy perceived to be gay; and C.P., a 17-year-old transgender girl. The plaintiffs alleged that the HYCF staff failed to intervene to protect them from relentless emotional, physical, and sexual abuse by other youth and that the staff also verbally harassed and demeaned them. The court issued a preliminary injunction, finding that the plaintiffs were likely to prevail at trial by showing that the facility violated their constitutional rights. The court found that HYCF was deliberately indifferent to the health and safety of the plaintiffs by failing to have policies and staff training necessary to protect LGBT youth, adequate staffing and supervision, a functioning grievance system, and a classification system to protect vulnerable youth. The court also held that placing youth in isolation as a means of protecting them from abuse amounted to punishment and violated the 14th Amendment of the Constitution.

The Prison Rape Elimination Act of 2003 (PREA) created the first federal statutory protections of LGBT youth in confinement facilities based on the research documenting that these youth were at significantly higher risk of sexual assault in custodial settings than their peers. The PREA regulations, adopted in 2012, imposed several significant protections specific to trans youth. Facilities must screen every resident for risk of sexual abuse, including identifying youth who may be at heightened risk because of their transgender status. Facilities may not automatically house trans youth according to their physical anatomy or assigned gender but must make individualized decisions to identify the most appropriate housing option, giving serious consideration to the youth's preference. Facilities must give trans youth the option to shower privately. The regulations place significant limitations on the use of protective isolation. Facility staff must be trained on how to conduct respectful and professional searches of trans youth and may not conduct searches for the sole purpose of discovering the youth's genital status.

The significance of these legal developments cannot be overstated. Combined with the research documenting disproportionate numbers and disparate treatment of trans youth, explicit protections have forced systems to acknowledge the existence of transgender youth in their care and required meaningful structural changes to promote their health and well-being.

Numerous state and local youth justice agencies have adopted policies prohibiting discrimination against youth based on the youth's sexual orientation, gender identity, or gender expression (SOGIE). Commonly, these policies prohibit physical, sexual, verbal, or emotional abuse by personnel or other youth, and they require fair and equal treatment of all youth irrespective of SOGIE. Many policies also prohibit staff from punishing or prohibiting behavior that is deemed to defy gender norms or engaging in formal or informal attempts to censor, suppress, or change a youth's gender identity or gender expression. Policies specific to facilities typically address operational issues, such as intake, housing, searches, confidentiality, medical care, and searches. Ideally, facility staff inform youth of their rights and obligations under the policy and explain the facility's process for submitting a grievance for any violation of the policy.

Most jurisdictions that adopt nondiscrimination policies also implement workforce development to ensure consistent understanding and application of the policy. Training is critical to developing systemwide competency. Many people are not familiar with basic concepts or terminology related to gender, and too many subscribe to misconceptions that lead to biased and harmful practices and undermine policies designed to support youth. Training is necessary, at the outset, to convey the foundational social science related to gender so that all personnel share a common vocabulary and understanding of relevant concepts. Training is also necessary to apply the facility's nondiscrimination policy to the questions that arise in daily practice and to ensure that participants understand their role in creating a safe and affirming system for all youth, irrespective of their gender identity or expression. Training also

provides an important opportunity to convey the agency's commitment to promoting the well-being of trans youth and to reinforce the values that support its policies.

Although less universal, data collection is becoming a critical strategy for promoting the well-being of systems-involved trans youth. Initially, intake staff began asking youth in facilities questions about their SOGIE as part of the risk screening required by the PREA standards. Many jurisdictions, however, have identified additional benefits to collecting these data, including developing more meaningful professional relationships and case plans, improving agency planning, and tracking bias, disparities, and outcomes. Effective implementation of data collection follows policy development and staff training. These steps help build the competency of staff to sensitively engage youth in these conversations, develop credibility and trust, and maintain the youth's privacy. Several state and county agencies have integrated these questions into their case management systems, facilitating more accurate analysis of deidentified data at different stages of the court process. Nationally, these data have confirmed that trans and gender-nonconforming youth are significantly overrepresented in the system.

K

K–12 Policies/Climate

Schools serve as an important and formative developmental context, especially because youth spend substantial amounts of time in school settings throughout adolescence. Cultivating positive school climates—characterized by perceived safety, interpersonal relationships with teachers and peers, teaching and learning environments, and physical environments of schools—is therefore fundamental to supporting the health and well-being of youth. Disparities in perceptions of school climate between LGBQ youth and their heterosexual peers are well documented. Trans youths' experiences in schools, however, are largely not examined independently of LGBQ youth, if at all. Notably, a vast majority of studies use fairly narrow assessments of sexual orientation and gender identity generally. Acronyms throughout this entry are therefore reflective of how sexual orientation and gender identity are represented within the literature referenced. Additionally, much of what is known about trans youths' experiences in schools has been studied only within high school and postsecondary educational settings, despite knowledge that trans youth are coming out and socially transitioning at younger ages (e.g., preschool through elementary school).

Despite the aforementioned limitations, the markers of negative school climates for LGBTQIA+ youth are clear: LGBTQ youth frequently report experiencing school-based victimization, harassment, and bias-based bullying (e.g., bullying because of a person's perceived or actual sexual orientation and/or gender expression) from their peers and teachers. As a result of these bias-based experiences, LGBTQ youth also report a lack of school support and safety in schools. This is especially concerning given that schools have the potential to serve as supportive contexts for LGBTQIA+ youth who may lack support within their families or broader communities. This entry discusses the importance of school climate for positive education-based and developmental outcomes, what is known about school climates for trans youth (and the limitations of this research), and the role of policies and programs in cultivating more positive and supportive school climates.

Importance of Positive School Climates

Decades of research illustrate key indicators of positive school climates for all students (regardless of gender identity, gender expression, or sexual orientation), including perceived safety, supportive and respectful relationships among adults and students in the school setting, and supportive learning and physical environments. When youth report attending schools with these characteristics, they also tend to report a stronger sense of connection to their schools (more commonly referred to as "school connectedness"). This sense of connectedness emerges from youth feeling a sense of belonging and that adults and peers at their school support their academic success, as well as care about them as individuals.

The interrelationship between school climate and school connectedness is central to the health and well-being of youth in school settings, as positive school climate and connectedness are associated with a variety of academic and developmental outcomes. These outcomes include lower rates of absenteeism, a stronger motivation to learn and succeed academically, higher academic achievement, fewer behavioral issues, and lower rates of depression and suicidal ideation. Additionally, connections to supportive adults and peers in schools may mitigate the detrimental effects for students who have negative school experiences, such as harassment and bullying. That is, although the overall school climate may not be positive for youth, supports can be established at the student and teacher level to mitigate the harmful effects of hostile school environments. Examining the experiences that contribute to hostile school climates for trans youth is necessary for better identifying protective factors within schools.

School Climates for LGBTQIA+ Youth

Two key factors contribute to negative school climates for trans youth: adverse experiences within school settings, such as victimization, harassment, and bullying, and school policies, practices, and curriculum that do not adequately address—or actively work against—the needs of trans youth. The roots of these factors are often two powerful systems of oppression: heterosexism and cissexism. Heterosexism privileges heterosexual sexual identities, attractions, and orientations; sexual identities other than heterosexual are therefore oppressed and marginalized, and people who hold these identities often lack access to resources available to their heterosexual peers. Similarly, cissexism privileges cisgender (cis) identities and expressions, thereby punishing those whose gender identities and expressions do not align with their sex assigned at birth (i.e., trans people). In the school context, these systems are at play in everyday interactions and in the policies that govern interactions within schools. From a systemic level, school policies may inhibit positive development among trans youth: That is, cissexist policies reinforce systems of oppression, placing trans youth at risk (e.g., policies that do not allow a trans student to change their name in school databases). At the structural and interpersonal level, without enumerated antidiscrimination, antibullying, and nondiscrimination policies that include gender identity and expression, violence against trans youth may go unaddressed.

Although LGBTQ youth have received considerable attention as a monolithic group in research that documents disparities in school experiences and related outcomes, there is relatively limited literature that focuses on trans youth specifically. Studies consistently underscore that compared to their non-LGBTQ peers, LGBTQ youth have poorer academic and health outcomes associated with experiencing hostile school climates. Specifically, LGBTQ youth who experience discrimination and victimization in schools tend to miss school more frequently and are at heightened risk of depression, self-harming behaviors, and suicidal ideation.

Evidence for disparities in school discipline are also emerging for LGBTQ youth, including LGBTQ youth being at risk of suspension even in instances where they are defending themselves when being bullied. Discipline disparities, especially the disproportionate use of punitive discipline measures, are associated with youth feeling less connected to schools. Out-of-school punishments are also associated with a range of negative outcomes, including a higher risk of entering what is commonly known as the "school-to-prison pipeline" or having interactions with the criminal justice system, including incarceration. More research is needed to determine whether trans youth are also more likely to experience discipline disparities. Such research should also account for youths' intersecting identities: For example, trans youth of color may be at higher risk of suspension than cis youth of color.

School Climates for Trans Youth

The lack of studies that specifically focus on trans youth is a notable gap in the literature on school climate. Much of what is known about trans youths' experiences in school contexts is primarily based on studies with small sample sizes, qualitative studies, studies based on convenience samples, and surveys conducted online. Nevertheless, studies that do focus on trans youth underscore that they frequently face unique challenges within schools relative to their cis LGB

peers. Relative to their cis peers, trans youth more frequently report experiencing bias-based victimization and bullying related to their gender identity and gender expression, and they have lower academic success. Of particular concern, trans youth often report feeling marginalized within various settings in schools, including in student-led organizations aimed at being safe spaces for all LGBTQ youth.

As of the late 2010s, studies based on representative samples—that is, samples that are generalizable to a larger population—that include measures of gender identity have begun to emerge. For example, studies that include representative samples of students in Minnesota found that trans youth were more than two times as likely as cis youth to experience multiple forms of harassment, including physical victimization and bias-based bullying related to gender identity and expression. Furthermore, one set of studies that included representative samples of middle and high school students in California found that experiences of bullying and harassment partially explain higher rates of substance use and suicidal ideation for trans youth relative to their cis peers. Additionally, trans youth frequently report experiencing multiple forms of bias-based bullying, such as bullying based on sexual orientation and gender identity/expression. There is a need for more school-based studies that include representative samples of trans youth to assess the magnitude of disparities in school experiences between trans and cis youth, to identify policies and practices that contribute to safer and more supportive school climates for trans youth, and to generalize findings to broader populations. Given that experiences in schools vary substantially based on various minoritized identities, future studies should also attend to youths' intersecting identities of gender identity, sexual orientation, race, ethnicity, ability, and socioeconomic status.

LGBTQ-Focused Policies and Trans-Supportive Resources

The inclusion of trans-supportive resources in schools, including allowing access to bathrooms and changing rooms that are aligned with a youth's gender identity, has been a source of contentious public debate. On one hand of the debate, people express concern about how changes to school policies and procedures might affect students generally. On the other hand, attending to the disproportionately negative experiences of trans youth in schools underscores the importance of such resources for improving the safety of physical school environments. More specifically, locker rooms and restrooms are often sites for bullying and harassment in schools, as they are often not monitored by adults. These spaces tend to be particularly unsafe for trans youth.

The example provided above is but one illustrating the need for policies and programs that better support trans youth in schools. However, federal policies that enumerate gender identity in school settings in the United States have been inconsistent and tenuous. In 2014, the U.S. Department of Education clarified that Title IX, which protects people from discrimination within any educational program that receives federal funding, also applies to gender identity. The U.S. Department of Justice supported this decision in 2016. Shortly after, in 2017, the Trump administration reversed many of the guidelines established under the Obama administration, including not recognizing gender identity under Title IX and no longer allowing trans students to use restrooms and locker rooms consistent with their gender identity. Then, in 2021, the Biden administration issued an executive order stating that discrimination against LGBTQ people was included in the prohibition against sex discrimination in Title IX and other federal laws.

The lack of consistent federal policy has led to substantial variability in state-level protections for trans students. As of 2020 in the United States, 16 states and the District of Columbia include enumerated policy addressing discrimination against students based on their sexual orientation and gender identity, with an additional 2 states that only include such protections for sexual minority youth. The lack of consistent policy contributes to wide variations in school districts' approaches to providing or withholding protections for trans students.

LGBTQ-Focused Policies and Their Limitations

Policies and practices that enumerate sexual orientation and gender identity are promising avenues for improving school climates, especial for LGBTQIA+ youth. This is an especially important

focus for improving education-based and developmental outcomes. Inclusive policies and practices can mitigate the negative effects of discriminatory experiences in schools, address behaviors that contribute to hostile school environments for LGBTQIA+ youth, and provide valuable sources of support for marginalized youth.

Although policies and practices that enumerate sexual orientation and gender identity have received increasing attention throughout the first two decades of the 2000s, most of the focus has been on policies and practices that address the negative school experiences of LGB youth, with less attention toward trans youth. Qualitative studies that have focused on the experiences and views of trans youth highlight that LGBTQ-focused policies tend to be more responsive to the needs of LGB students. However, findings from quantitative studies have been mixed, with some evidence that such policies are associated with less absenteeism and victimization for both trans and cis youth, and other findings that LGBTQ-focused policies are associated with less victimization, bias-based bullying, and absenteeism and generally more positive evaluations of school climates for LGB youth but not trans youth.

Multifaceted Approaches to Improving School Climates: From Policy to Practice

Schools often serve as a nexus between families and the community, and they are uniquely positioned to implement multipronged approaches to address the needs of trans youth. These approaches can include antibullying policies that enumerate gender identity, providing training for teachers on the policies and how to better support trans students, including curriculum inclusive of diverse gender identities in the classroom, as well as access to health services that are responsive to the needs of trans youth. While studies provide some support that antiharassment and bullying policies that enumerate sexual orientation and gender identity are associated with less bullying, such policies often operate indirectly: Teachers are more likely to intervene when witnessing bias-based harassment in schools that have enumerated policies. Such policies may therefore both signal that bias-based harassment will not be tolerated and raise awareness of issues related to bullying and harassment among teachers and staff. Simply adopting antiharassment policies may therefore have a limited effect without also training teachers and staff on the policies and providing them the tools and resources needed to better support marginalized youth.

There are numerous other mechanisms that schools can implement to improve institutional supports for trans youth. One strategy is to allow trans students to officially change their name in school records and to go by their chosen name at school. Similarly, trans youth whose restroom and locker room use is not restricted by the school administration are less likely to experience assault at school. More generally, curriculum that is inclusive of trans identities validates trans youth, and that increases visibility of diverse gender identities among students and teachers, representing an important source of validation for trans youth. Providing access to physical and mental health services that are inclusive of trans identities, either at school or through health providers in the broader community, also provides a valuable source of support for trans youth who are often navigating complex social and physical transitions. Schools can therefore serve as an important resource on numerous fronts, both within schools and by helping connect youth and families to other resources throughout the community.

Gender and Sexuality Alliances

Gender and Sexuality Alliances (GSAs) are student-led organizations that are intended to provide safe and supportive spaces for LGBTQIA+ youth, as well as cis heterosexual allies. Such organizations can raise visibility of LGBTQIA+ youth and may encourage schools to adopt more inclusive and supportive policies. Some studies, however, suggest that students who participate in these organizations may experience more victimization and harassment because these clubs raise the visibility of LGBTQIA+ youth in schools. Nevertheless, empirical studies point to positive outcomes associated with GSAs, including better health outcomes, such as lower substance use and lower risk of suicidality, and academic outcomes, such as less truancy, especially for LGB youth. Additionally, GSAs are avenues for

increased civic engagement and stronger connections to peer groups.

Much of the literature on GSAs tends to focus on LGBTQ youth as a monolithic group, not distinguishing between sexual orientation and gender identity, largely because of small sample sizes. However, as with LGBTQ-focused policies, there is evidence from studies that do differentiate between sexual orientation and gender identity that such organizations are especially helpful to LGB youth and less impactful for trans youth. In fact, qualitative research with trans youth indicates that they often feel marginalized within such organizations, as GSAs often do not attend to the unique experiences and needs of trans youth. In recognition of this issue, the GSA Network revealed a name change from "Gay–Straight Alliances" to "Gender and Sexualities Alliance" to emphasize the diversity of youth the organization strives to support. Based on limited available evidence, this is an important first step, although more changes are likely needed within GSAs to make them more supportive and inclusive spaces for trans youth.

Conclusion

Relative to cis students, trans students are at higher risk of experiencing hostile school climates and lacking strong social supports within schools. Although broad LGBTQ-focused policies are a promising avenue for improving school climates, such policies may be more responsive to the needs of LGB youth and of limited benefit to trans youth. Trans youth are confronted with unique challenges and hostilities within school contexts, and therefore targeted policies that are more responsive to their experiences and needs are needed to improve school climates. More research, especially population-based studies, is warranted to accurately assess school-based disparities between trans and cis youth, as well as to identify and inform intervention and preventive efforts to create safer and more supportive schools for all students.

Kink/BDSM Communities

The acronym BDSM stands for bondage, dominance/submission (DS), and sadism/masochism (SM). The term *kink* is sometimes used as a synonym for BDSM and often used for an even broader array of sexual practices and preferences that transgress sexual norms, for instance, fetishes. Both terms refer to sexual and erotic practices among consenting adults and may describe practices and relationships as well as identities of practitioners.

There are various connections between trans people and BDSM. Historically, sexology has considered transvestitism as a fetish and therefore deviant sexual practice, effectively pathologizing crossdressing that is considered to have an erotic value for the individual. On a community level, trans people have been affected by the fact that the BDSM communities have historically been divided into men-only (targeting gay and bisexual cis men), women-only (targeting lesbian and bisexual cis women), and mixed (targeting mostly heterosexual cis people) subsets. Finally, trans people are involved in developing specific BDSM practices such as playing with gender. While the state of research on trans and BDSM is still meager at the beginning of the 2020s, it has been shown that BDSM practices, relationships, and communities can provide trans people with a context in which they can be sexual outside of a cisnormative framework.

The following section of this entry discusses how BDSM, as the epitome of nonreproductive sexuality, provides trans people with options to express themselves as sexual beings. Next, the entry describes gender play as a specific BDSM practice; it concludes by presenting the issue of trans inclusion in the various community subsets.

BDSM and Embodied Transsexuality

According to ethical standards of the modern BDSM communities, interactions have to be consensual to qualify as BDSM (rather than violence). The process of establishing consent starts before the actual BDSM encounter ("session" or "scene") with negotiations. Participants agree upon the roles they will assume and the nature, as well as the limits, of the activities. Sessions are most often of a limited duration with a clear, ritualized beginning and ending (while some BDSM relationships are defined nonstop). Consent is considered ongoing in that there is a veto-right throughout the activity and a responsibility for aftercare.

BDSM and *kink* are broad umbrella terms for a variety of erotic practices. The acronym itself encompasses such diverse practices as immobilization (bondage), playing with intense stimulations of the body and mind (sadism/masochism, also referred to as sensation play), and staging a significant or exaggerated power imbalance (dominance/submission). Furthermore, there is a broad range of different kinds of role-playing, fetishes, and bodily practices such as water sports (i.e., the use of urine), fisting (i.e., the skilled anal or vaginal insertion of a balled hand), and so on, which all could be considered kinky or edgy. There is no agreed-upon definition or boundary as to what constitutes BDSM or kink. It even remains contested whether BDSM should count as sex at all, given that it does not necessarily focus on or involve nudity, genital sex, or unmediated touching of bodies, for instance, in a flogging session or when role-playing a military drill scene. BDSM has therefore been theorized as the paradigmatic example of nonreproductive sex. Therefore, BDSM practices, relationships, and communities can provide a context for trans people who wish to be sexually active without nudity or involvement of their genitals being expected or required of them.

For instance, it is common among BDSM practitioners in general to wear outfits in order to enhance a certain fantasy role or to prefer fetish wear such as rubber over nudity. Moreover, some fetish clothing may be used to modify the body, such as a corset for transfeminine people. In BDSM, genital sex is decentered by expanding sensations to the whole body beyond what counts normatively as erotogenic zones, such as spanking a butt, flogging a back, or boot-blacking. These nongenital practices may lead to orgasm for the participants. Other BDSM practices are supposed to prolong sexual tension rather than releasing it through orgasm, such as chastity belts, bottoms being denied orgasm, or long-term bondage. Especially in the lesbian/women-only community, the extension of the body through artifacts like

dildos is common practice and often considered as real as a penis in flesh. Therefore, especially queer BDSM contexts offer an easily accessible environment for trans people avoiding nudity or cisnormatively genital sex.

BDSM has also been described as a sexual preference potentially overriding sexual orientation (based on the biological sex or gender of the partner) for some practitioners, given its decentering of genital interaction. For instance, a heterosexual cis man may choose to play with another cis man because of their BDSM skills. These alternative concepts of sexuality and intimacy may also make it easier for trans people to find partners than in more conventional cis/heteronormative dating contexts.

Finally, using sensation play as a means to ground and to reconnect to their body is a common theme among BDSM practitioners. Trans people have also reported being able to feel their otherwise estranged body in this way and experiencing this as positive, given the sexual benefits a BDSM encounter awards to them and their partners. BDSM has been therefore described as enabling sexual experiences for trans people who would otherwise live celibately unwillingly.

Gender Play

BDSM also presents a space to explore and experiment with gender in an embodied and sexual fashion. Role-playing in BDSM is not limited to power play, and the roles people assume are not limited to the question of who acts as top ("in charge/control" during the encounter) or bottom (handing over control). Due to its theatrical and playful nature, the concept of negotiating consent beforehand, and its out-of-the-ordinary ritualized setting, sexual role-playing and BDSM spaces can be used to embody different roles, personas, or identities than in everyday life.

Playing with gender in this way is particularly popular in the women-only and queer BDSM communities. The simplest example of what this may entail is someone embodying another gender than one's everyday gender, such as a cis woman playing a male character, but gender play can also take other shapes beyond binary gender models. For instance, somebody with a rather stable everyday gender identity may use BDSM to experiment with gender fluidity, someone with a rather coherent everyday gender identity may present as ambiguous (e.g., "genderfucking"), or a genderqueer person in everyday life may emphasize a distinct partial aspect of their identity in BDSM, for example, playing a high femme. Nonbinary gender individuals may enjoy playing with stereotypical binary characters to create erotic tension. Some trans people play on transphobic themes as a means to work through their experiences and empower themselves.

The gender roles people assume for play can be defined in great detail, for instance, embodying a particular form of stereotypical masculinity/femininity or inventing nonnormative (gender) queer characters. Such characterizations should also be analyzed in their intersections with age (e.g., a cis woman playing "boi") race, class, sexuality, and so on. Combining gender with age play can be part of a process for trans people to compensate for missed experiences in childhood or adolescence in their gender of choice, to explore, (re)claim, or (re)create the children or adolescents they could have been.

Some individuals always play in the same character in BDSM, which may always be in a different gender than in the rest of their lives; others may use BDSM to explore a range of differently gendered positions. To some, BDSM serves as a space to playfully engage with gendered possibilities separate from their ordinary life. Transgressing gender norms may then serve as an erotic thrill. To others, gender play becomes a more serious form of self-exploration, and the characters they develop there may eventually be adopted into everyday life. Some trans people use BDSM as a safer space to experiment with gender and develop their identities before they transition in the cisnormative, gender-policing world. Genderqueer people have used BDSM to explore, express, embody, and live all of their differently gendered selves.

In gender play practices, play partners actively co-construct the gendered embodiments they assume for the duration of the scene. This may involve nonsurgical body modifications such as wearing dildos, which are then perceived as regular parts of the material embodiment rather than artificial extensions. Such temporary trans embodiment may become a permanent part of the body image. This process can catalyze a physical

transition or alter the body image in a way that renders a physical transition immaterial and unnecessary.

In conclusion, trans people may experience certain BDSM practices and contexts as providing them with the opportunity to embody gender differently than in cisnormative contexts, where gender is not agreed upon consensually, even if performing and embodying gender is also regulated in some way in BDSM communities. It has been subject to critical discussion that other categories of difference such as race and class are not engaged with in the same transformative way as gender, age, and sexuality in queer BDSM contexts, which are predominantly white.

Trans Inclusion in the BDSM Communities

The BDSM community is organized according to sexual preferences. The heterosexually centered (mixed) subset is open to all genders. Therefore, trans people do not face formal barriers to participating, but it remains contested whether the mixed scene is trans-friendly or cisnormative. Individuals from the transfeminine spectrum have historically been tolerated by the mixed community: This has provided some trans women and crossdressers with a community affiliation, albeit often on the lowest end of a hierarchy regarding status. Moreover, the practice of "forced feminization" has been criticized by trans and queer BDSM practitioners as heterosexist, as it is based on the assumption that it is humiliating for cis men to be dressed and act as feminine. Such cissexist ideas may also explain the low status of transfeminine people in the mixed community.

The lesbian or women-only subset has been mostly inclusive of trans women (but not male crossdressers) in some groups as early as the 1980s, when the women-only community first emerged. Additionally, the community has reacted to some of their members transitioning by providing them with the option to remain a part of their community, thus including transmasculinities and trans men in their door policies. Today, the community therefore is characterized by a great diversity of gender expressions, including cis women, trans women, trans men, femmes, butches, bois, and genderqueer people.

While trans inclusion has sparked controversy in all gender-exclusive spaces, the gay male or men-only subset has historically been less welcoming to trans people than the lesbian/woman-centered BDSM community, and it is only slowly that trans men are accepted in men-only spaces. One explanation is that gay male spaces tend to identify more around a supposedly shared sexual culture of hypermasculinity (whereas women-only communities tend to frame the question of trans inclusion as a political debate). In conjunction with misperceptions of trans men as women and not masculine, transmasculine people have therefore been considered a potential disturbance in a space that seeks to celebrate masculine sexual energy. For similar reasons, transfeminine people are also not welcome, with the exception of the Sisters of Perpetual Indulgence (an internationally active organization that uses drag and parody of religious symbolism for queer political activism and fundraising) in their function as community HIV/AIDS educators and fundraisers.

Since the 2000s, some mixed queer or "trans and friends" BDSM spaces have been developed in order to create opportunities for LGBTQI people to explore playing together beyond the homo/hetero or cis/trans divisions. These tend to fully embrace or even focus on trans people's needs rather than just tolerating them.

In conclusion, the issue of trans inclusion varies across BDSM community subsets and has sparked discussions about the boundaries of men-only/women-only spaces in particular. This has led to the creation of new play spaces in which the omnirelevance of binary sex/gender as the foundation of sexuality has been questioned through alternative practice.

Lambda Legal

The Lambda Legal Defense and Education Fund—known as Lambda Legal—is the oldest and largest legal organization in the United States that seeks to achieve equality for lesbians, gay men, bisexuals, trans people, and everyone living with HIV. It does this through impact litigation (pursuing cases that could establish important precedents), education, and public policy work. Lambda Legal has more than 100 staff in six offices around the country—New York, Atlanta, Dallas, Chicago, Los Angeles, and Washington, D.C. In support of trans people, the organization has taken on and won cases that address the legal recognition of trans people, the conditions for trans prisoners, and anti-trans discrimination in employment, education, housing, and health care.

Origins

Lambda Legal was incorporated in 1973 in New York City by lawyer William Thom, who recognized the need for a nonprofit legal organization that fought for the civil rights of lesbian and gay people, similar to how groups existed to further the equality of women and people of color. In fact, Thom modeled the organization after the Puerto Rican Legal Defense and Education Fund, copying their papers of incorporation verbatim, except changing references from "Puerto Rican" to "lesbians and gay men." Lambda Legal's first client was itself; a New York court turned down Thom's application for incorporation in 1971 on the grounds that he had not demonstrated that the organization would be for the public good. The decision was overturned on appeal by the highest court in New York State in 1973, allowing Thom to officially start the organization.

Trans-Related Legal Work

Trans people suffer persistent inequalities in all aspects of life. They experience rampant workplace, school, and housing discrimination; face difficulties in obtaining appropriate name and gender designations on their identity documents; and lack access to quality health care and to transition-related medical services, including in prisons. These disparities are exacerbated for trans people of color because they experience discrimination based on gender identity, race, and potentially other characteristics. Lambda Legal has been involved in cases in all of these areas.

Employment

Employment is one of the most legally challenging and personally difficult areas for trans people. They are often passed over in the hiring process, and if they are able to find employment, they frequently experience privacy violations, harassment, and even physical and sexual violence on the job. One of Lambda Legal's cases challenging discrimination against trans people in the workplace

resulted in a landmark decision in *Glenn v. Brumby* (2011). The U.S. Court of Appeals for the Eleventh Circuit ruled that a government worker who fires a trans employee because of their gender nonconformity violates the Equal Protection Clause of the 14th Amendment by engaging in sex-based discrimination.

Education

Trans students frequently feel unsafe and experience discrimination at school both from other students and from teachers and administrators. In 2016, Lambda Legal filed a lawsuit on behalf of three trans students against a suburban Pittsburgh, Pennsylvania, school district that required students to use the restroom that corresponded to their sex assigned at birth. The organization won a preliminary injunction that halted the policy and then reached a settlement, which required the district to allow students to use the restrooms that reflect their gender identity (*Evancho v. Pine-Richland School District,* 2017). Lambda Legal won a similar case against a suburban Jacksonville, Florida, school district in 2018 (*Adams v. School Board of St. Johns County, Florida*), which has been appealed by the district.

Housing

Trans people experience high rates of housing discrimination, eviction, and homelessness in the United States. Lambda Legal's work in this area included a lawsuit against a Boulder County, Colorado, property owner who refused to rent a housing unit to a same-sex couple, one of whom was trans, and their children because she worried that doing so would jeopardize her standing in the community. A U.S. district court ruled that the property owner's actions had violated both the federal Fair Housing Act and the Colorado Anti-Discrimination Act (*Smith v. Avanti,* 2017).

Legal Recognition

Having the appropriate name and gender marker on legal documents is critical for trans people, as it not only validates their identities but also prevents them from having their privacy violated and being subjected to possible harassment and discrimination. Lambda Legal has challenged governments that refuse to correct gender markers on trans people's identity documents. In Puerto Rico, the organization won a groundbreaking case in which the court found that refusing to correct the gender marker on trans people's birth certificates violates their constitutional and human rights, for "the right to identify our own existence lies at the heart of one's humanity" (*Arroyo v. Rosselló,* 2018). Lambda Legal has also won cases in Idaho and Kansas to allow trans people to correct their birth certificates.

Health Care and the Rights of Incarcerated Trans People

Lambda Legal has challenged the categorical denials of transition-related health care in state Medicaid plans and in state employee health care plans. The organization has also fought for the right of incarcerated trans people to access medically necessary health care. A lawsuit against the Missouri Department of Corrections resulted in trans people's being able to access transition-related treatments, including hormone therapy, permanent body hair removal, and gender-affirming beauty products, whether or not they had been diagnosed with gender dysphoria before entering prison (*Hicklin v. Precynthe, et al.,* 2018).

Other prison cases addressed by Lambda Legal have involved trans inmates experiencing harassment and violence because of not being housed according to their gender identity. It sued the Texas Department of Criminal Justice on behalf of Passion Star, a trans woman who was incarcerated in a male facility in Texas, which led to her being repeatedly physically and sexually assaulted. A victory in the case resulted in Star receiving monetary compensation when she was released from prison and a change to the department's policy on the incarceration of trans prisoners.

Latinx People

The Latinx trans community, like all other communities, is not a homogenous one. The experiences of trans Latinxs depend on many factors, including nationality, immigration status, gender identity, ethnicity, socioeconomic status, and level of education. In this entry, the term *Latinx* is used to represent trans Latinos/as/@s/es. Depending on the context, some use the @ symbol to represent Latinos and/or Latinas, while others use the letter *x* to avoid gender-binary language and be inclusive of nonbinary trans people or for other political/personal reasons. Moreover, the term *Latinx* here is used to represent anyone born in a Latin American country or of Latin American descent, which does not include Spanish-speaking trans people from European countries (e.g., Spain). This entry summarizes the state of trans Latinxs, discusses some visible Latinx trans advocacy organizations and activists, and suggests areas where more research is needed on Latinx trans people.

The State of Trans Latinxs

Demographics

Few studies have attempted to estimate the size of the Latinx trans population in the United States. The largest study of trans people, the 2015 U.S. Transgender Survey (USTS), which included nearly 28,000 respondents, found that almost 1,500 respondents, or slightly more than 5% of the sample, self-identified as Latinx. But even though the USTS made special efforts to increase the participation of Latinx people, such as by having the help of one of the largest Latinx trans advocacy organizations, the TransLatin@ Coalition; translating the survey into Spanish; and holding survey-taking events in Latinx communities, the research likely underrepresented Latinxs. Some undocumented Latinx people may not have taken the USTS because they were concerned that it would not be anonymous and somehow lead to them being deported (only 0.2% of participants indicated an undocumented residency status). In addition, the survey instrument was only available online, which meant that it was less accessible to individuals without a computer or reliable Internet access or who were less web savvy. Given that Latinx people as a group are poorer and less formally educated than white people, these barriers likely led to less Latinx involvement. Reflecting the general distribution of the Latinx population in the United States, the Latinx survey participants were concentrated in the western and southern regions of the country (39% and 31%, respectively), which was greater than the sample overall (31% and 27%, respectively).

The USTS found that the Latinx trans respondents had much worse outcomes than people in the United States overall in almost all areas of life. For example, trans Latinxs were reported to be three times as likely to be unemployed than the general U.S. population (21% vs. 7%), twice as likely to be living in poverty (43% vs. 18%), four times as likely to have been sexually assaulted (48% vs. 12%), five times as likely to be HIV positive (1.6% vs. 0.3%), more than twice as likely to be homeless (31% vs. 14%), and 1.5 times as likely not to have earned a college degree (80% vs. 54%). Given these disparate experiences, it is not surprising that the survey also found that the Latinx trans individuals indicated a much higher rate of extreme psychological distress than the rest of society (45% vs. 5%). In general, the Latinx trans women respondents reported having more negative experiences than the Latinx trans men and nonbinary individuals. For example, the trans women were more likely to experience rejection, violence, and harassment from family members

and more likely to be expelled from their house. They also more often indicated having been fired, denied a promotion, or not hired in past year because of their gender identity.

Sociological Disparities

The disparities related to issues of public health, criminal justice, and education for Latinx trans people are difficult to parse out due to their intersectional nature. That is, while Latinx trans people report generally worse outcomes in these areas than their white counterparts, many of these outcomes reflect the intersections of ethnicity with other factors, including socioeconomic and immigration statuses.

Public Health

Trans women of color tend to have worse experiences than their trans men and nonbinary counterparts in all areas of health, and the same is true for Latinx trans women. According to findings from the USTS, Latinx trans women are more likely to be uninsured and four times higher than their white counterparts to be living with HIV. Additionally, about a third of trans Latinxs had at least one negative experience with a health care provider, about a quarter do not go to a doctor for fear of mistreatment, 12% have been through conversion therapy, and almost half have attempted suicide at some point in their lives. Because of such experiences, they are nine times higher than the general U.S. population to have experienced serious psychological distress. In addition, many Latinx trans women encounter discrimination in the health care system. Research by Scott Rhodes and colleagues (2015) found that Latinx trans women in North Carolina, especially those who had an undocumented immigration status, reported challenges accessing health care and safe medical practices. As a result, many were forced to obtain estrogen through nonmedical sources. Similarly, in a study of the health care experiences of 22 trans people of color in the Chicago area, more than a third of whom were Latinx, Susanna Howard and colleagues (2019) found that a majority of the participants had negative experiences in the health care system. In particular, trans women reported that health care providers assumed on the basis of their ethnicity that they were sex workers and lacked cultural competency. Future research on the health care experiences of Latinx trans people should examine the intersections of ethnicity and gender identity with socioeconomic status, education, and employment discrimination in order to consider possible associations with the risky sexual behaviors that lead to a higher incidence of HIV among Latinx trans people, as well as to determine successful strategies for outreach to the Latinx trans community.

Criminal Justice System

As with health issues, Latinx trans people experience disparities in the criminal justice system, which includes being more likely than white trans people to have negative interactions with the police. Among the Latinx trans respondents in the USTS who had interactions with law enforcement officials who knew or thought they were trans, about two thirds experienced some form of mistreatment, such as verbal harassment, misgendering, or physical or sexual assault, compared with 55% of the white trans respondents. Given the extent to which Latinx trans people have been abused by the police, it is not surprising that the study also found that they were more likely than white trans people to say that they would feel uncomfortable seeking help from the police if they needed it. While not addressed by the research, another factor could be a fear of deportation among the Latinx participants with an undocumented residency status. More Latinx nonbinary people (73%) reported discomfort with the police than did Latinx trans women (52%) and men (55%), which could be because they were more readily seen as trans by law enforcement officials.

Education

Latinx trans people also experience disparities in K–12 education. According to the USTS results, almost three fourths of the Latinx individuals who were out or perceived as trans in school experienced some form of bullying, such as being disciplined more harshly, prevented from dressing in accordance with their gender identity, verbally harassed, or physically or sexually assaulted.

Harassment and violence were especially common among Latinx trans women. Compared with the rest of the USTS respondents, they were far more likely to have been physically or sexually assaulted or verbally harassed because of their gender identity, to have left a school because the mistreatment was so bad, or to have been expelled.

Sources of Support and Advocacy

Although trans Latinxs endure numerous hardships, they have also established vibrant communities and developed their own support networks and advocacy organizations, which often serve as safe havens and buffers against the effects of racism, classism, transphobia, and transmisogyny. The support of family and friends is an important source of nurturance for Latinx trans people. In particular, research by Rhodes and colleagues (2015) found that Latinx trans women often receive support from other trans women, especially in cases where family members are not supportive. According to the research of Javier Garcia-Perez, a strong family support system, in addition to a strong ethnic identity, can help alleviate some of the negative effects on mental health for Latinx LGBTQ+ youth.

Latinx LGBTQ+ activists have created a number of organizations, including Casa Ruby, Familia: Trans Queer Liberation Movement, and the TransLatin@ Coalition, to support members of the Latinx trans community. Casa Ruby, begun in Washington, D.C. in 2012, was the vision of Ruby Corado, a trans Latinx immigrant from El Salvador who wanted to provide the kinds of services that did not exist for trans people of color like her when she came to the United States. Casa Ruby offers a 24-hour drop-in space, housing and immigration assistance, preventive health care, and support for survivors of violence. Founded in Los Angeles in 2014 by Jorge Gutierrez, Familia: Trans Queer Liberation Movement is a national LGBTQ Latinx racial justice organization. The group's work includes ending the detention and deportation of trans undocumented immigrants, helping individuals who have survived detention and forced migration to heal, and supporting LGBTQ asylum seekers with humanitarian, legal, and medical support. The TransLatin@ Coalition was formed in 2009 by Bamby Salcedo and other trans Latin@ leaders to organize and advocate for the needs of trans Latin@s immigrants to the United States. Based in Los Angeles, the group runs the city's Center for Violence Prevention and Transgender Wellness, which provides a range of services from ESL classes and food to leadership development and research. Nationally, the TransLatin@ Coalition has representative in nine U.S. states and Washington, D.C., as well as in Mexico City.

Latinx trans people have become more visible in recent years in the news media and on television. Prior to the 2010s, one of the few well-known Latinx trans individuals was Sylvia Rivera, a participant in the Stonewall Riots who became a leading voice for trans people. Since then, a number of Latinx trans leaders have emerged. In addition to Corado and Salcedo, other prominent Latinx trans activists include Jennicet Gutiérrez, who became well known after interrupting a news conference by President Barack Obama on immigration issues, and Drago Renteria, the founder of the Deaf Queer Resource Center. A number of Latinx trans actors also achieved acclaim with the phenomenal success of the TV series *Pose,* among them Zoey Luna, Indya Moore, and MJ Rodriguez.

Suggested Areas for Further Research

Much of the research to date on Latinx trans people has focused on Latinx trans women. While this emphasis is understandable given the high rates of harassment and discrimination they often experience, future studies also need to consider Latinx trans men and nonbinary individuals. Additionally, many studies include trans Latinxs as part of a larger study of queer Latinx or people of color, resulting in few works that focus only on trans Latinxs. Finally, considering the sources of stress and violence that Latinx trans people endure in the systems mentioned earlier, it is important for more allies who are part of the Latinx community to contribute to research in these areas.

Leadership

Trans people are best positioned to identify the needs of the trans community and lead the changes necessary to improve the lives of trans people. Trans people have historically experienced marginalization, even within the LGBTQIA+ community, which has created barriers to leadership opportunities and the erasure of the contributions of trans leaders. Despite these obstacles, trans leaders have emerged at the forefront of organizing efforts to increase visibility and establish resources. This entry examines the contributions of trans leaders within the trans rights movement and trans people who provide leadership in settings that are not trans specific. The need for trans leadership is clear, with trans people continuing to face discrimination in employment, housing, and public accommodations in the United States and globally.

Barriers to Trans Leadership

The trans community has a long history of standing up to oppression and combating injustice. Trans leaders have been a driving force for social change and have served as powerful movement galvanizers throughout history. However, the contributions of trans leaders and their successes are often minimized or co-opted by people who hold varying levels of cis, heterosexual, white, and economic privilege within trans and LGBTQIA+ movements as well as in non-trans-specific organizations. These factors can be linked to the invisibility and erasure of trans leaders both within and outside of LGBTQIA+ movement history, alongside the disproportionate silencing of leadership from queer and trans people who are Black, Indigenous, or people of color (QTBIPOC).

Ongoing invisibility has forced trans people to advocate for themselves within organizations that proclaim to serve their interests. To gain leadership positions, trans people often face tensions around assimilationist ideas and respectability politics. Assimilation demands that trans people perform binary gender norms to be viewed as worthy of dignity and respect; to be successful in leadership positions, they have to be mindful not to make cis people uncomfortable. Trans leaders argue that trans people have often been left behind for the sake of incremental progress for the rights of wealthy, white lesbian and gay individuals; among the latter, trans inclusion is often viewed as too radical and must come after gay rights are achieved. For example, trans leaders have expressed concerns about the well-supported national campaigns for marriage equality while there is no national outcry about the vulnerability and safety concerns of trans people, who continue to endure high rates of unemployment, homelessness, and murder.

Trans Leaders in Trans Advocacy

Powerful trans leaders can be found on all fronts fighting for collective liberation. Trans people have a legacy of working to combat oppressive systems that limit their livelihoods and opportunities. Many trans individuals exist at the intersections of multiple oppressed identities and/or statuses that place them in situations of heightened vulnerability. These experiences shape many trans leaders' view that to ensure collective liberation through movement work, it is necessary to center those who are most vulnerable. Trans leaders throughout history have been key organizers in movements calling for gender justice, racial justice, immigrant justice, environmental justice, reproductive justice, economic justice, disability justice, and social justice as a whole. By taking a broad view, trans leaders acknowledge that trans people live multifaceted lives and that all social justice issues are trans issues. Furthermore, the visibility of trans leaders establishes role models for trans children and youth.

Efforts to increase trans leadership are supported by trans-led national organizations. The National Center for Transgender Equality (NCTE) advocates for policy change under the direction of founder and executive director Mara Keisling. Another trans-led organization is the Transgender Law Center (TLC), directed by trans person of color Kris Hayashi. TLC is working to empower other trans leaders and uplift the voices of QTBIPOC people via "The Trans Agenda for Liberation," a project begun in 2020 that centers the voices of trans people of color and demands that Black trans women and Black trans femmes be trusted as leaders. It is led by Micky Bradford, a Black trans femme. The agenda stresses that due to their deep understandings and lived experiences with discrimination and transmisogynoir, Black trans feminine individuals are best suited to lead the fight against the oppressive systems that cause everyone harm. Another organization, the Transgender Strategy Center, is committed both to advocacy and to the development of trans leaders by offering coaching, training, and technical assistance to trans individuals and organizations.

Given the value of centering trans youth voices, a few national organizations have started trans youth leadership programs. One example is TRUTH (TRans yoUTH), a national youth-led leadership and storytelling program developed through the Transgender Law Center and the GSA Network in 2015. Another example is Trans Student Educational Resources (TSER), a youth-led organization whose goals are to encourage educational institutions to be more trans inclusive and train youth to be effective organizers. Trans youth are also finding community on college campuses, where LGBTQIA+ centers and student organizations include opportunities for trans-specific advocacy and training and seek trans leaders.

The modern-day LGBTQIA+ movement has roots in trans youth leadership, as Marsha P. Johnson was 23 years old and Sylvia Rivera was 17 when they helped lead the Stonewall Riots in 1969. As trans youth increasingly receive support within their communities and families and have greater access to resources, they are able to disclose their gender identity at younger and younger ages. This enables trans youth to become involved in advocacy and develop leadership skills to address their needs. Leadership opportunities for youth create possibilities for future leaders.

Trans Leaders in Regional Grassroots Organizing

Trans leaders globally are creating opportunities for leadership through organizing initiatives that are led by and for trans people. These grassroots organizing efforts recognize the need for local community relationships and support and center the importance of trusting trans people's experiences and knowledge to develop solutions to the issues they face. Some of the key ways in which trans leaders seek to affect their communities and empower other trans leaders are through cultural organizing, political engagement, community building, mutual aid, community care, and artistic expression. Many QTBIPOC organizations, such as Southerners on New Ground, Southern Fried Queer Pride, House of GG, and the Black Trans Circles Project, are especially noteworthy for using grassroots organizing to uplift and center the voices of trans people, particularly QTBIPOC in the South and Appalachia. Trans-led organizations give voice to people like Bamby Salcedo, who is the president and CEO of the TransLatin@ Coalition, an organization established in 2009 to support and advocate for the needs of trans Latina immigrants in the United States. Such organizations provide much-needed resources for trans people living in underserved areas and create space for trans people to thrive.

Trans Leaders in Politics and Law

Openly trans people have only recently begun running for and winning elections to public office. While LGB people have been increasingly visible and successful in electoral politics, as demonstrated by Pete Buttigieg's 2020 presidential campaign, trans people continue to face obstacles. Primary concerns include pervasive transphobia in public perceptions as well as the lack of funding for trans candidates, as political campaigns are expensive, and there are limited funds available through trans and trans-supportive political action committees (PACs). The only national trans-specific PACs are the Trans United Fund and the National Center for Transgender Equality Action Fund, which were established in 2016 and 2017, respectively.

The first openly trans person was elected in 1992 to the Arvada, Colorado, city council, and only 16 trans people were elected to local or regional positions in the United States before 2017. The elections in 2017 were known as the rainbow wave because many LGBTQIA+ people, including the largest number of trans people ever to do so, ran for office in response to the election of anti-LGBTQIA+ candidates, most notably Donald J. Trump, and efforts to pass anti-LGBTQIA+ legislation in 2016. Of the 51 trans people who ran for local, state, and federal office in 2017, 8 were elected, including 2 trans people of color. Andrea Jenkins, a Black trans woman, and Phillipe Cunningham, a Black trans man, were elected to the Minneapolis, Minnesota, city council. At the same time, Danica Roem was elected to the Virginia House of Delegates, beating an anti-trans incumbent to become the first openly trans person to be elected to, and seated in, a state legislature. Three trans people were elected to state office in 2018: Brianna Titone to the Colorado House of Representatives and Gerri Cannon and Lisa Bunker to the New Hampshire House of Representatives. In November 2020, history was made when Sarah McBride was elected to the Delaware state senate, making her the country's first openly trans state senator. In that same election cycle, Stephanie Byers became the first openly trans person elected to the Kansas House, and Mauree Turner, a Black nonbinary individual, was elected to the Oklahoma House, becoming the first known nonbinary person elected to a state legislature.

Trans political leadership is especially critical, given the huge upsurge in anti-trans legislation. Examples of this include North Carolina HB2 in 2016, which required people to use public restrooms that matched the gender marker on their birth certificates before the law was amended, and South Dakota HB 1057 in 2020, which sought to ban transition-related health care for trans minors. In an effort to motivate potential trans political candidates, national organizations such as the National LGBTQ Task Force have started to offer candidate training.

Trans People as Leaders in Non-Trans-Specific Settings

Trans people became more visible in society during the 2010s and have become key leaders in a number of cultural and professional settings. From professional sports to businesses and corporations, trans people are providing leadership while also contributing to cultural change by being out about their gender identity. In the creative and performing

arts, trans leaders are using music, dance, writing, photography, visual art, performance art, film, and theater as platforms to share their stories, express their passions, display their talents, share new ideas, and, in the process, enact social change.

Trans leaders in the arts have advocated for the self-representation of trans people in media and popular culture. Allowing trans people to tell their own stories provides authenticity and creates employment opportunities for people whose lives are depicted in entertainment but who historically have not been hired for these roles because of employment discrimination. Many popular television shows and films, such as the 2005 film *Transamerica,* have featured cis actors playing trans characters. Amazon Studio's *Transparent,* which aired from 2014 to 2019, employed many trans people, including actors Trace Lysette and Alexandra Billings and writer and producer Our Lady J, although a cis man was cast in the lead role. But trans advocates have gained some success in having trans people play trans roles. For example, Netflix's *Orange Is the New Black* first aired in 2013 with a recurring trans character played by actor Laverne Cox. She later was the first openly trans person to be featured on the cover of *Time* magazine. The television show *Pose* made history in 2018 by hiring the most trans producers, writers, and actors ever in a regular series, including best-selling author and advocate Janet Mock as a producer. Mock signed a programming deal with Netflix in 2019 to further increase intersectional trans visibility. The 2020 documentary *Disclosure: Trans Lives on Screen* provides an in-depth look at trans representations in film and television through interviewing trans actors, writers, producers, and directors.

Trans people are emerging leaders in other, non-trans-specific organizations. Martine Rothblatt, CEO of United Therapeutics, and Vivienne Ming, founder and co-chair of Socos Labs, are examples of trans women who have broken barriers to lead corporations and think tanks. Trans leaders in sports are breaking longstanding barriers to their participation by advocating for trans-inclusive policies. Professional trans athletes such as triathlete Chris Mosier, the first openly trans athlete to represent the United States in an international competition, and Patricio Manuel, the world's first openly trans pro boxer, are using their platforms to argue for the rights of trans athletes beyond just their sports. Caitlyn Jenner, the 1976 Olympic decathlon champion, was awarded the 2015 Arthur Ashe Courage Award at the ESPYs (Excellence in Sports Performance Yearly Awards) for being public about her transitioning earlier that year. At the high school level, trans athletes, including Mack Beggs, Andraya Yearwood, Terry Miller, and Sarah Rose Huckman, have used their voices and personal experience to fight for trans inclusion, showing how trans leadership is continuing among a new generation.

LGBTQ Movement, Trans Inclusion In/Exclusion From

Individuals who today are referred to as trans people have been involved in the LGBTQ rights movement ever since there was a movement. Indeed, if the Stonewall Riots in 1969 are taken as the start of the modern LGBTQ rights movement, then trans people were many of its founders. For much of the 25 years following Stonewall, however, trans people were largely excluded from the movement because of a combination of political expediency and animosity from cis lesbian and gay leaders. In the late 1990s and 2000s, a new generation of queer activists, who recognized the extent and severity of anti-trans discrimination, including within the movement itself, united with trans people in the struggle against gender oppression. Since

then, trans issues have become more central to the larger LGBTQ movement, but divisions remain, especially over the failure of many LGBTQ organizations to take an intersectional approach and focus on the experiences of trans people of color.

The Early LGB(T)Q Rights Movement

Because of experiencing high rates of harassment and violence, trans people, especially trans people of color, have often had to fight literally and figuratively for their lives, which has meant that they have had little choice but to be engaged in a struggle for their rights. For example, since trans people of color are more likely to be subjected to police violence than other LGBTQ people, it is not surprising that they made up a significant portion of those who participated in the Stonewall Riots, just as they had been at the center of earlier confrontations with the police, including incidents that occurred at Cooper Do-nuts in Los Angeles in 1959 and at Compton's Cafeteria in San Francisco in 1966. Thus, trans people did not join the movement for LGBTQ rights so much as a movement sprang up around them.

But almost immediately, the movement that they helped to create sought to exclude them for the sake of political expediency, as cis gay members believed that they could gain their rights more quickly and easily if trans people were excluded. Six months after the Stonewall Riots, a group comprised mostly of white middle-class gay men in New York City established the Gay Activists Alliance (GAA) to work solely for their own rights. Trans people were not only kept off GAA's agenda but were also not welcomed in the group. Two trans women of color who were involved in the riots and subsequent trans organizing, Marsha P. Johnson and Sylvia Rivera, were made to feel uncomfortable when they attended GAA meetings and were often the only people in drag and sometimes the only people of color there. Similar gay groups that marginalized trans people were subsequently organized in other U.S. cities.

Trans people were even pushed out of commemorations of the Stonewall Riots. On the 1-year anniversary of the riots, activists organized the Christopher Street Liberation Day March, named for the location of the Stonewall Inn. Trans people who sought to participate were reportedly told by event leaders that they should march at the back, which they refused to do. Efforts to exclude trans people from the event became more institutionalized in subsequent years. No trans people were scheduled to speak at the 1973 Christopher Street Liberation Day, which led Rivera to force her way onto the stage and denounce the gay liberation movement for ignoring and marginalizing her and other trans people of color. In response, event organizers gave Jean O'Leary, the founder of Lesbian Feminist Liberation, permission to read a statement that denounced drag queens as an insult to women. This, in turn, prompted Lee Brewster, a drag queen who had fought against the erasure of trans people from the Christopher Street Liberation Day, to likewise push his way onto the stage, where he reminded the crowd that the Stonewall Riots would not have occurred without drag queens, but now they were being insulted and told not to be themselves. He ended his comments by saying that he was quitting the gay liberation movement. At the same time, lesbian separatists and more conservative gay men in San Francisco who were opposed to trans people and individuals in drag being involved in that city's commemoration of the Stonewall Riots organized an alternative march in 1973 that banned their participation. In subsequent years, this event became San Francisco's main Stonewall celebration.

TERF and Turf Battles

Many lesbians left organizations like GAA in the early and mid-1970s because of the sexism of gay men, but one area of agreement between the two groups in general was their rejection of trans people. Some self-styled radical feminists viewed trans women not as "real" women but as "male infiltrators" into the movement and sought to exclude them from "women's spaces." One of their first targets was Beth Elliott, an openly trans lesbian activist and singer who had been the vice president and the newsletter editor of the San Francisco chapter of the Daughters of Bilitis until being pushed out by newer, trans-hating members. These anti-trans feminists also sought to remove Elliott from the 1973 West Coast Lesbian Conference, which she helped organize and at which she was scheduled to perform. When she took the stage, she had some audience members

attempt to shout her down, saying that she was a man. Others defended her. Although more than two thirds of attendees reportedly chose to allow her to remain in an impromptu vote, Elliott chose to leave anyway because of the tremendous harassment she had received.

The attacks against Elliott marked the start of the exclusionist policing of "women's spaces" by some radical feminists. Another target was Sandy Stone, a sound engineer who, as part of the all-women Olivia Records, helped create the genre of women's music in the mid-1970s. Stone had disclosed her gender identity to the record collective and had its support, but when her gender history became widely known, Olivia was deluged with hate mail from lesbians who threatened a boycott or even violence if Stone was not fired. The collective initially defended her but, fearing that they would be put out of business, reluctantly asked Stone to resign, which she did in 1979.

Arguably the most vitriolic and influential attack on trans people from the lesbian feminist movement was Janice Raymond's *The Transsexual Empire: The Making of the She-Male,* published in 1979 and reissued in 1994. Raymond, a leading scholar in women's studies, fomented the witch hunt against Stone and effectively made trans women pariahs in many lesbian feminist communities. At the center of Raymond's argument was her paranoid conspiracy theory that trans women were male-identified, "artificial" women who were being used by the medical and psychological specialties that supported trans people in transitioning—"the transsexual empire" to which her title referred—to secretly infiltrate lesbian communities and undermine feminism. According to Raymond, trans women were rapists because they appropriated women's bodies for themselves, and their mere presence in lesbian feminist spaces constituted an act of forced penetration that violated women's lives. Beginning in 2008, Raymond and other anti-trans feminists began to be referred to as TERFs—trans exclusionary radical feminists—in order to distinguish them from the larger radical feminist movement, which had historically supported and been inclusive of trans women.

It is not only trans women whom some lesbian feminists have sought to remove; at times, they have also erased historical figures who seem to have been trans men, misrepresenting them as butch women. For example, jazz musician Billy Tipton lived as a man for more than 50 years, apparently kept the knowledge that he had been assigned female at birth even from his partners and adopted children, and died of a treatable medical condition in 1989 rather than seemingly risk disclosure of his assigned sex by being examined by a doctor. Yet some lesbian historians and writers have argued that he was a lesbian who felt compelled to pass as a man to succeed as a musician, which, besides denying how Tipton lived his life and died, ignores the fact that he continued to live as man after he had retired from performing.

Another example of trans male erasure occurred following the murder of Brandon Teena in 1993. Even though Teena had told his lovers and friends that he was a trans man, many reports of his death referred to him as "she" and treated him as a lesbian woman. For example, writing in *The Village Voice,* lesbian journalist Donna Minkowitz described Teena as a self-hating butch lesbian whose failure to accept "her" body and sexuality contributed to "her" death. The coverage incensed many trans people and led to one of the first public protests by trans people outside of *The Voice*'s offices; Minkowitz apologized for her misgendering and victim blaming, but not until 25 years later.

For trans people, the issue was not only how some lesbian feminists policed the "border" between butch lesbians and trans men, as well as dismissed or refused to recognize anyone who went across it, but also how writers like Minkowitz saw trans men as "really" lesbians in denial. This view denies agency to trans people and negates their experiences, for it means that regardless of how someone might identify or express their gender, only the sex assigned to them at birth matters. Ironically, lesbians themselves have historically not been considered "real" by heterosexist men, who did not take their sexuality seriously. Moreover, many of the lesbian feminists who have claimed Tipton, Teena, and other female-assigned men as their own after their deaths would have likely rejected and sought to exclude them from "women's spaces" while they were alive.

Absent "T" ism From LGB Events

The exclusion of trans people from the LGB movement continued into the 1990s. Reflecting the

persistence of anti-trans bias among some lesbian feminists, trans women were banned from the National Lesbian Conference in 1991, and a trans woman, Nancy Jean Burkholder, was expelled that same year from the Michigan Womyn's Music Festival. The festival, an annual weeklong women's outdoor music and cultural event, had been a pilgrimage for thousands of lesbians since it began in 1976. While the event had always been for "womyn only," Burkholder's removal was the first known exclusion of a trans woman. Afterward, festival organizers articulated a policy limiting attendance to "womyn-born womyn," and they continued to ban trans women, despite growing opposition to this stance, until the festival ceased operations in 2015.

Like the commemorations of the Stonewall Riots in the 1970s, national marches in the 1990s were not welcoming to trans people. Despite the efforts of trans activists and some cis LGB allies, "transgender" was not included in the names of the 1993 March on Washington for Lesbian, Gay, and Bi Equal Rights and Liberation and the 1994 International March on the United Nations to Affirm the Human Rights of Lesbian and Gay People—the march that was held in New York City to observe the 25th anniversary of the Stonewall Riots. The 1993 march organizers were persuaded by trans activists to add trans people to the event's platform, which, among other demands, called for a LGBT civil rights law and legislation banning discrimination against LGBT people. But only one of the individuals invited to address the rally self-identified as trans—Phyllis Randolph Frye—and she was relegated to speak at the assembly point stage, rather than the main stage, after most participants had left to march. For many lesbian and gay leaders, trans people remained peripheral and expendable; while ostensibly part of the movement, their presence and specific struggles were ignored, especially when doing so could potentially further lesbian and gay rights and visibility.

LGB *and* T

Gen Q

Influenced by the work of trans activists, writers, and scholars, a younger generation of cis lesbian and gay individuals—many of whom started to refer to themselves as "queer" instead of "lesbian" or "gay"—became supportive of the rights of trans people and considered them a critical part of what increasingly became known as the LGBTQ movement. While many lesbian feminists in the 1970s and 1980s were influenced by *The Transsexual Empire,* many young queer women in the mid and late 1990s—some of whom had yet to be born when Raymond's book was originally published—had their attitude toward trans people shaped by Leslie Feinberg's *Stone Butch Blues* and Kate Bornstein's *Gender Outlaw.* Feinberg's semi-autobiographical 1993 novel tells the moving story of Jess Goldberg, an individual who journeys from being a butch lesbian in the years before the Stonewall Riots, to passing as a man in order to survive the economic recession of the 1970s, to living outside of a gender binary in the 1980s. Bornstein's 1994 work combines memoir, performance, and commentary to offer insights into how society constructs gender. Many young queer women activists, as well as trans individuals, considered these books necessary reading, and many instructors in LGBTQ and sexuality studies assigned them in courses in the 1990s.

Some younger cis queer women also became more supportive of trans people through their involvement in drag king culture. While individuals assigned female at birth had long experimented with gender and challenged gender categories by performing in traditional men's clothing, the specific form of performance known as drag kinging developed in the mid-1980s in London and San Francisco. Initially, many of the performers were trans men and cis lesbians, and as drag kinging became popular in cities throughout the United States, it led to more interactions between the two groups and helped de-emphasize and blur the boundaries that had been the basis of the "border war" that butch lesbians waged against trans men in the 1980s and 1990s.

LGBTQ Organizations Becoming More Trans Inclusive

By the late 1990s, the efforts of trans activists and allies had resulted in many national, state, and local organizations in the Unites States that had focused primarily on LGB rights to begin to address gender identity issues. The National Gay

and Lesbian Task Force added trans people to its mission statement in 1997 and changed its name to the National LGBTQ Task Force in 2014. PFLAG (formerly Parents, Families, and Friends of Lesbians and Gays) and GLAAD (formerly the Gay and Lesbian Alliance Against Defamation) added trans people to their missions in 1998 and 2013, respectively, and rather than changing their names to be trans inclusive, the groups stopped spelling out their acronyms. The largest lesbian and gay rights group, the Human Rights Campaign (HRC), amended its mission statement to include trans people in 2001, although this change was not immediately reflected in its work, as it continued to focus on LGB issues.

While no non-trans-specific national LGBTQ rights organization has had a trans executive director as of 2020, many have hired trans people to senior staff positions, often with responsibilities related to outreach to or advocacy for trans communities. Long-time trans leaders in LGBTQ organizations include Shannon Minter, the legal director for the National Center for Lesbian Rights (NCLR); Jennifer Levi, the transgender rights project director for GLBTQ Advocates and Defenders (GLAD); Beck Bailey, the director of the Workplace Equality Program for HRC; and Nick Adams, the director of Transgender Representation for GLAAD.

At the state and local levels, most of the organizations established since the mid-1990s have included trans people in their names and missions. Cases in point are the offices and centers that have been founded at U.S. and Canadian colleges and universities to support LGBTQIA+ students, staff, and faculty. Among the 26 professionally staffed offices and centers that were created before 1995, all but 2 had names indicating that their constituencies were "gay and lesbian" or "gay, lesbian, and bisexual" individuals. As of 2020, there are more than 175 such centers and offices, and all are trans inclusive in both their names and mission statements.

However, the proliferation of "LGBTQ" organizations has not always resulted in greater attention to the needs of trans people; in some cases, the "T" seems to stand for "token," rather than "trans." The most infamous example of trans inclusion being little more than rhetoric involved the Human Rights Campaign. In 1994, the organization helped draft, and had allies in Congress introduce, the Employment Non-Discrimination Act (ENDA), a bill to protect workers based on their sexual orientation. Trans leaders were incensed by the exclusion of "gender identity" and lobbied Congress and the public for it to be added—only to have HRC work to thwart their efforts. Following the failure of the bill by one vote in the Senate, HRC continued to insist on shutting out trans people when the legislation was reintroduced the next year, fearing that a more inclusive bill would lose votes. In response, trans activists and allies picketed the organization's fundraising events, until HRC agreed not to oppose an amendment to add "gender identity" as a protected class. Neither the amendment nor the original bill was approved by Congress, and the legislation was stalled for the next decade.

In 2007, ENDA was revived by openly gay Representative Barney Frank, who, after failing to gain support for a trans-inclusive version, put forward a measure without trans protection. Despite the Human Rights Campaign's promise that it would support only trans-inclusive legislation, the organization did not oppose Frank's bill. HRC's about-face showed that some within the mostly older, more conservative lesbian and gay establishment continued to see trans people as dispensable. However, more than 400 LGBTQ groups—virtually every major LGBTQ organization other than HRC—formed a coalition called United ENDA to advocate for the restoration of gender identity protection. Although the effort failed to change the bill, it represented a major turning point in support for trans rights, and the coalition succeeded in having gender identity language included in ENDA thereafter and in the subsequent Equality Act, which, if passed, would ban discrimination based on gender identity, sex, and sexual orientation in employment, public accommodations, education, housing, and credit.

LGBTQ Organizations' Support for Trans Rights

Along with including trans people in larger nondiscrimination legislative efforts in the 2010s, LGBTQ groups also became more involved in trans-specific advocacy and support. Particularly noteworthy has been the work done by LGBTQ legal organizations, including Lambda Legal, NCLR, and GLAD, to protect the rights of trans

people, which has resulted in landmark legal victories addressing anti-trans discrimination in employment, education, housing, health care access, and prisons. For example, NCLR and GLAD led the challenge to the Trump administration's ban on trans people serving in the military, and Lambda Legal won a critical federal court case involving employment discrimination against trans people that helped set the stage for the U.S. Supreme Court's far-reaching decision in 2020 that "sex discrimination" in federal employment law includes discrimination based on gender identity and sexual orientation.

National LGBTQ organizations have also become involved in publicizing the Transgender Day of Remembrance, including calling attention to the fact that the vast majority of trans people killed annually are trans women of color. However, these groups have come under criticism for not addressing the intersectional issues faced by trans women of color, who not only experience high rates of violence but are also more likely than other trans and cis LGB people to be subjected to harassment and discrimination, live in poverty, experience homelessness, and struggle with addiction. For example, LGBTQ organizations are largely not involved in efforts to establish a living minimum wage, enact universal health care, decriminalize sex work, and defund the police—all changes that would greatly benefit trans people, especially trans women of color.

Thus, while the LGBTQ movement in general no longer explicitly excludes trans people, many national LGBTQ organizations still need to do more to be truly trans inclusive. Moving forward, the movement needs to center the lives of trans people of color, which means that LGBTQ groups must hire more trans people of color to senior staff positions, support and work more closely with trans organizations, and operate from an intersectional perspective that considers the combined effects of racism, sexism, and genderism. Ultimately, the movement can only be considered successful if it uplifts and liberates all LGBTQ+ people.

M

Māhū

The term *māhū* (intersex, queer, trans, two-spirit) evolved out of traditional and contemporary Hawaiian ideas about gender, sexuality, and the body. Like *intersex, queer,* and *trans, māhū* describes a wide range of physical traits, cosmologies, social expressions, and sexualities that challenge and affirm culturally specific expectations that differ from Western culture. This entry discusses the intersections of māhū identification, colonialism, cultural imperialism, Hawaiian sociality, decolonization, and social harmony to contextualize trans indigeneity in Hawaii and the Pacific.

Colonialism and Heteronormativity

In the 1970s, cisgender Hawaiian scholar Mary Kawena Puku'i, one of the foremost experts on traditional Hawaiian culture and knowledge, described māhū as "homosexuals" and "hermaphrodites" while explaining the coexistence of *kāne* (men), *wāhine* (women), and *māhū* (intersex, queer, trans, two-spirit) in ancient Hawaii. However, her description of māhū ironically failed to adequately describe māhū as a uniquely Hawaiian identity that had evolved despite the domination of Judeo-Christianity, the nuclear family, and heteronormativity. In the light of subsequent scholarship, any such Western bias in Kawena Puku'i's work can be understood as a reflection of colonialism.

Colonialism in Hawaii began with the arrival of the expedition of the British Royal Navy and Royal Society on a ship commanded by Captain James Cook in 1778 and the arrival of Euro-American, Judeo-Christian missionaries in the 1820s. As military navigators sought goods and natural resources for exploitation, missionaries suppressed Indigenous people through the cultural power of law. Heteronormativity vis-à-vis the nuclear family became a way of imposing social control and cultural imperialism.

The nuclear family is the dominant, often preferred family structure in the West—a problematic concept when it leads to the exclusion of other family forms and practices. These exclusions are evident on cultural, religious, and political levels around the world. European and American forms of colonialism in particular have demonized traditional Indigenous understandings of gender and sexuality, thus criminalizing queer and trans individuals and marginalizing chosen and extended families. The nuclear family is of course not inherently a bad thing, but it is a hegemonic construction of family that can focus more on one's immediate familial makeup. Such a construction does not incorporate other purposes of family, which include those that establish personal relationships that uphold tenets of unconditional love and support. Extended families may look different, but there is no less love shared between them.

In contemporary Hawaii, māhū have found themselves reclaiming the extended family or *ohana* as a means to challenge the imposition of the nuclear family structure in debates about same-sex marriage and Hawaiian sovereignty, and they have consistently maintained a sense of inclusive

social harmony between the three sexes: wāhine, māhū, and kāne.

Decolonization and Social Harmony

As a concept, māhū indigenizes the coexistence of māhū, kāne, and wāhine as part of the extended family principle central to Hawaiian Polynesian sociality. In the Hawaiian creation story, the Kumulipo, there are three sexes: wāhine (woman; female), which is the first sex; māhū (intersex), the second; and last is kāne (man; male). Acknowledging three sexes has long been a part of Hawaiian *mo'olelo* (stories) and *mo'oku'auhau* (genealogies).

According to māhū teachers Hinaleimoana Wong (Hina) and Kaumakakahiwa Kanaka'ole, the physical and spiritual attributes of māhū embrace both kāne and wāhine, akin to the Native American notion of two-spirit. Hina, in particular, describes this duality in terms of māhū decolonization that recenters Hawaiian functionality and values, including those of the ohana, or extended family unit. In this way, Hina challenges the nuclear family silos that maintain Western domination and cultural imperialism.

Tiana Henderson, who identifies as a cisgender wāhine and māhū, is a traditional *hale* (Hawaiian house) builder who describes social harmony between wāhine, māhū, and kāne in terms of Hawaiian architecture. According to Tiana, in Hawaiian architecture, it is the *pou mānu,* a māhū support beam in a traditional Hawaiian house, that connects the *ule* (penis/male post) to the *kohe* (vagina/female post). In such architectural design, she claims, the hale, like the ohana, leaves no one behind, whereby mutual love and support are shared equitably between the three sexes: wāhine, māhū, and kāne.

Drag Performativity

Cocoa Chandelier, a famous Native Hawaiian drag queen, demonstrates the complex nature of Kanaka Māoli (Indigenous Hawaiian) māhū subjectivity. Cocoa's performance at the Universal Show Queen Pageant in 2014, one of the largest and most popular drag events in Hawaiian history, illustrated how one māhū employs performance to evade the colonial trappings of Hawaiian identification. In her performance, Cocoa refuses to identify herself as Hawaiian and, unlike the other Hawaiian drag artists on the stage, chooses a completely different culture (specifically Indian culture of India) as a means to endorse her cultural identity as a Hawaiian. By doing so, Cocoa demonstrates how the social expressions of māhū elude deterministic and reductive conceptions of identification and instead signal cross-cultural connection and the confluence of indigeneity across the world to decolonize the performance sphere.

Manning, Chelsea

Born on December 17, 1987, in Crescent, Oklahoma, Chelsea Manning first made the national news in 2010 after her arrest in the high-profile "WikiLeaks" case. This entry explores the legal history of her case and its impact on the rights of trans prisoners and military personnel.

Private First Class Manning, an Army intelligence analyst who began active duty in 2007, was charged with 22 counts relating to the unauthorized possession and distribution of more than

720,000 military and diplomatic documents, mostly about the wars in Afghanistan and Iraq. Collectively, this was the largest leak of classified records in U.S. history. Among the items leaked was video footage entitled "Collateral Murder," depicting an American Apache helicopter killing 12 unarmed civilians in Baghdad in 2007. Manning told the court her motivation for whistleblowing and leaking the records was to encourage a public debate about the role of transparency in U.S. foreign policy and military operations.

Defense lawyers argued Manning experienced a gender identity crisis while serving in the Army and that the military failed to address the problem. At one point in her Army career, Manning emailed her superior a photo of herself dressed in "women's" clothing and referred to herself as Brianna. The email was entitled "My Problem," and Manning reported that she received a confirmed receipt of the message but that ultimately her "problem" was ignored. Her lawyers claimed that this lack of support exacerbated the situation, ultimately contributing to her decision to leak the documents.

Although she was acquitted of aiding the enemy (a capital offense akin to treason), Manning was court martialed and dishonorably discharged in 2013. She received a 35-year sentence for having been convicted of 20 charges, including espionage. This sentence was the longest ever handed down in U.S. history in a case involving transmission of government information. The debate about whether or not American interests actually were put in danger by the release of these documents was heated.

The day after sentencing, Manning initiated her social transition at the national level in a public statement shared via her lawyer on NBC's *Today* program, announcing, "As I transition into this next phase of my life, I want everyone to know the real me. I am Chelsea Manning. I am a female. Given the way that I feel, and have felt since childhood, I want to begin hormone therapy as soon as possible."

The Army did not provide hormone therapy to Manning, limiting her treatment initially to antidepressants and psychotherapy. The American Civil Liberties Union sued the Department of Defense over its refusal to provide medical treatment. In 2015, the Army agreed to administer hormone treatment, making Manning the first person to receive health care related to gender transition while in a military prison. Furthermore, Manning engaged in a lengthy fight for gender-affirming surgery that included a hunger strike, two suicide attempts, and lengthy periods in solitary confinement. In 2016, the Army agreed to provide surgery (although not in time for her release).

Manning also had to go to court to compel the military to change her name officially and to use feminine pronouns when communicating to or about her. Prison officials refused to let her grow her hair long, denied her "women's" clothing, and barred her from communicating directly with the public. The United Nations Special Rapporteur on Torture formally ruled that the U.S. government's treatment of Manning was inhumane and degrading.

While some within the LGBTQIA+ community did not find Manning's whistleblowing activities heroic, international support for her release grew, including a petition signed by approximately 117,000 people asking for her sentence to be commuted. Support was also generated through Tumblr campaigns and videos posted to social media, including *I Am Bradley Manning* and *Pardon Private Manning*. Most major LGBTQIA+ organizations likewise called for her release.

The Army denied a clemency application in 2014. In 2016, Manning made an official petition to reduce her sentence. Against the advice of his defense secretary, President Barack Obama agreed to commute her sentence in 2017 to the 7 years she already had served. In 2018, the U.S. Army upheld Manning's court-martial conviction for violating the Espionage Act.

In 2019, Manning fought a subpoena to testify before a grand jury about WikiLeaks. A federal judge found her in contempt for refusing to cooperate, and she was taken into custody until the grand jury's term ended. Upon her release, she was immediately summoned to appear before another grand jury. She again refused to comply, was rearrested, and was jailed for the 18-month duration of the grand jury's term. Manning said she objected to the secrecy of the grand jury process and that she already had revealed everything she knew during her court martial.

Manning's increased public visibility included a series of columns for *The Guardian*, an appearance in *Vogue* magazine, television appearances, and speaking engagements. She was invited and then disinvited to serve as a marshal for the

San Francisco Pride parade and to be a fellow at the Harvard Kennedy School's Institute of Politics. Other public activities included an unsuccessful run for the U.S. Senate in 2018. A documentary about Manning, entitled *XY Chelsea,* was released in 2019, and her personal memoir is scheduled to be published in 2021.

Manning's case sparked public debate about the role of trans individuals in the military. The ban against trans people serving in the U.S. military was lifted by the Obama administration in 2016, reinstated by the Trump administration in 2017, and then removed again by the Biden administration in 2021. Furthermore, Manning's case shed light on the challenges and dangers facing trans inmates in civilian and military prisons, prompting reforms. An additional long-term impact was a review of established reporting practices and journalism-style guidelines employed by mainstream media. Eventually, journalists adopted the name "Chelsea" and used "she/her" pronouns in their media coverage of Manning, and many style manuals were modified to provide guidance for reporting about trans people in a more sensitive manner.

Marriage

The term *marriage* can refer to a legal status, a religious rite, or a culturally recognized union between two or more people that serves as the foundation for their shared rights, obligations, relational systems, and families. Constructions of marriage have varied widely across time and cultural context. Whereas many English-speaking colonial cultures have tended to view marriage as a public and binding legal contract between two people of cisgender experience who are heterosexual and monogamous, this does not reflect accurately the global histories of "marriage," which varies widely across times, societies, and contexts.

Some people have referred to marriage that involves a trans person as trans marriage. Yet the phrase "trans marriage" is a misnomer, as it obscures the wide ranges of partner genders, sexuality, and relationship diversity among people of trans experience. This term might describe heteronormative marriages between one woman and one man, where one spouse is of trans experience. It might also describe marriages between people who either began with different legal gender designations and ended up being between two partners of the same legal gender designation or began with the same legal gender designation and ended with different legal gender designations. It might also describe marriages between nonbinary people. Finally, it could refer to marriages in which both partners change legal gender designations to remain both different or both the same legal gender designation.

Legal Gender Recognition

The term *legal gender recognition* refers to whether and how governments recognize people's gender identities. In legal jurisdictions where a change of gender on government-issued documents is a recognized option, in some cases this means that binary men or women of trans experience can be legally married in accordance with their respective legally affirmed gender. Even when people can change gender on their documents, however, this does not necessarily mean they are recognized as that gender for the purpose of marriage. For example, legalization of marriage between two people

with the same legal gender designation in Australia did not automatically grant equal marriage rights to people of trans experience. Although the Australian Capital Territory and South Australia already permitted people to change their legal gender designation even if they were married, Victoria, New South Wales, Queensland, and the Northern Territory changed their legislation within 12 months of passage of the new law legalizing marriage between two people of the same legal gender. Western Australia and Tasmania followed suit over a year later.

Some early modern societies, like ancient Greece, Rome, and Mesopotamia, recognized marriages between people with the same legal gender designation. This was also true in areas of China such as the Fujian and Guangdong provinces in the 14th to 17th centuries, as well as from the 18th century to early modern times in some colonial European countries. These unions, however, have only more recently been reintroduced or relegitimized on a global scale. Indeed, as of 2020, there are 29 countries around the world that recognize marriages between people with the same legal gender designation. In addition to marriages between people with the same legal gender designation, some countries also recognize nonbinary gender designations, including Argentina, Australia, Bangladesh, Canada, Germany, Iceland, India, Malta, Nepal, Aotearoa/New Zealand, Pakistan, Uruguay, and some states within the United States.

While legal and social strides toward recognition of marriages between people with the same legal designation globally may in some cases be signs of progress in terms of marriage equality for people of trans experiences, backgrounds, and identities, this apparent greater social flexibility and progress in definitions of marriage and related boundaries may obscure how the legal status of marriage for trans people remains precarious in many countries. Depending on where a trans and/or intersex person resides, they may be prohibited from marrying partners of a similar gender or of a differing gender due to legal distinctions and related restrictions, or they may be allowed to select a gender that was not assigned at birth but forced to select a binary gender category to be listed on their official marriage documentation. In legal jurisdictions where marriages are not defined with distinction of a requirement of gender (e.g., man, woman), being able to marry as a trans person involves comparatively fewer complications.

Some governments recognize binary changes to gender while refusing to recognize people's nonbinary genders. In legal jurisdictions that offer more gender options beyond people's birth-assigned categories, where people can self-identify any gender that fits them without the verification and/or approval of external authority (e.g., medical, clinical, judicial), and/or people of any gender are welcome to marry partners of any other gender, there are fewer barriers to recognition of marriages involving one or more trans partners. In Argentina, for example, people can choose their gender designation without medical intervention, psychiatric review, or judicial oversight and can select a nonbinary gender. Yet, even with greater flexibility around gender designation, many people of trans identities, backgrounds, and experiences still often face difficulties related to divorce.

Forced Trans Divorce

In many countries, people who wish to change their legally recognized gender are required to be unmarried at the time when they change this designation. In some jurisdictions, this policy is enforced by legislation, whereas in others, it is administrative policy that would not require legislative change to be removed. This requirement for people seeking to change their gender designation to be unmarried results in cases where people who may be happily married are forced to choose between remaining married while retaining government-issued documents that do not reflect their gender identity or getting divorced from a spouse with whom they wish to remain married in order to have their gender respected. This issue, commonly known as "forced trans divorce," has been discussed by human rights activists internationally as a violation of the human rights of people of trans experience and their partners to form families and have their marriages recognized as valid. This issue highlights the intersections between cisgenderism (the ideology that delegitimizes people's own understanding of their gender and bodies) and heterosexism. In many regions, such as in Japan and Russia, marriages recognized by law must be between a person classified as female and a person classified as male, although some

jurisdictions within Japan recognize relationships between people with the same legal gender designation. Many regions, such as Hungary and Jamaica, do not recognize changes to initial gender designations on identity documents for people of trans experience, expression, or identity.

Forced trans divorce and refusal to change people's gender on government-issued documents can have wide-ranging effects. For example, a case in the United Kingdom of a woman of trans experience, MB, was referred to the European Court of Justice. The MB case challenged the rule prohibiting women of trans experience from claiming their pensions at 60, which is the same age as other women, unless they divorced their wives. In 2004, with the passage of the Gender Recognition Act, the U.K. government determined it was acceptable to force people who wished to change their legal gender designation to end their marriages before doing so. This discrimination was justified due to the claim that people could either remarry or form a civil partnership in their new gender. Women of trans experience such as those who applied for their government pensions were denied recognition as women and denied payments from their government pensions from the female age. This violated the religious freedom of women of trans experience who had religious objections to divorce, as in the landmark case of MB. This issue of pension rights has far-reaching financial consequences that result in economic disparities.

Clinical Concerns

People in marriages with one or more trans spouses may seek therapy to address problems within or outside of their relationships, just like anyone else. This may be due to the unique stressors and marginalization they face due to being confronted with forms of cisgenderism, such as transphobia and cissexism, including cisgenderist behavior by therapists. For instance, if a dyad in which one or both members of the relationship are trans seek premarital therapy, the therapist would face barriers in starting the premarital-based clinical work with them using an evidence-based premarital assessment tool like the PREPARE/ENRICH or the RELATE. Indeed, despite these businesses and related assessments being beneficial to cisgender couples premaritally for 35 and 30 years, respectively, these assessments were not normed or standardized on trans individuals and couples originally and, to date, have yet to be with couples in which one or both partners are trans who are seeking premarital therapy. This is just one example of the way that cisgenderism manifests in clinical practice, particularly in clinical testing, measurement, and programming, which is frequently exclusionary to trans people's relational systems. Despite the lack of evidence-based premarital assessment tools for clinical work with trans therapy participants, in 2019, Mary Minten and Cass Dykeman published a tool for assessing relationship functioning in trans marriages, entitled the "Marriage Checkup With Transgender Couples."

Cisgenderism can permeate the clinical experience for trans people in other ways as well. For instance, some clinicians believe that if one partner in a marriage discloses trans experience, it means the end of that marriage. Even if this hurdle is not present, there are no historical models of couples therapy designed for trans individuals and couples. While gender-affirming guidelines and practices have been shared and models can be applied to clinical work with transgender married couples, these remain sparse, as well. Indeed, in 2012, Markie Blumer and colleagues published, in a content analysis of the family therapy peer-reviewed journals and related articles between 1997 and 2009 and of the 10,739 articles examined across the 17 field-related journals, only 9 articles, or .0008%, focused on trans individuals, relationships, and clinical concerns.

Conclusion

Legal marriage is a valued goal for many people around the world, including people of trans identity, background, and experience. Moreover, the value of marriage has gone up in recent decades, in part because of its exclusionary nature (e.g., marriage not being available to everyone, marriage perceived as something for educated and economically stable people). Often trans people are excluded from the right to marry. Indeed, the majority of the countries around the world—166 of the 195 countries—have exclusions around marriage for people of the same legal gender, which frequently affects trans people and partners. Even when marriage between a trans person or partners is legally recognized, difficulties around divorce, often in the form

of forced trans divorce, are a painful reality. Married trans people often face unique stressors and marginalization and thus may seek out therapists and counselors for outside support. Thus, clinical providers need to be gender affirming in their practice.

Marriage, Divorce, and Parenting, Legal Issues

Trans people have made great legal and social progress, although they continue to face lingering discrimination in the family law arena. Before nationwide marriage equality, trans people faced a patchwork of conflicting state laws and judicial opinions regarding the validity of their marriages. Since the Supreme Court struck down gender-based restrictions on marriage in 2015, trans people who marry or wish to marry now have the same legal protections as others. In the contexts of divorce and child custody, however, trans people continue to face unique legal challenges and disadvantages due to the persistence of misinformation and bias.

Validity of Marriages Before Nationwide Marriage Equality

In 2015, the Supreme Court in *Obergefell v. Hodges* struck down state laws that barred same-sex couples from marriage. As a result of that decision, two persons of any gender who otherwise meet the requirements for marriage are free to marry and must be given the same state and federal rights and benefits as all other married couples.

In addition, no state may refuse to recognize a valid marriage from another state simply because one (or both) of the spouses is transgender.

Before that landmark decision, each state could set its own rules about trans people and marriage, which resulted in a chaotic patchwork of conflicting legal rules. In some states that barred same-sex couples from marriage, state courts invalidated marriages in which one spouse was trans, holding that for the purposes of marriage, a trans person could not legally change their gender. In these cases, the courts held that, even if the individual had undergone a gender transition, the marriage was an invalid same-sex union. For example, in 1999, the Texas Court of Appeals invalidated a 7-year marriage between a trans woman and her deceased husband. The court held that a person's legal gender is genetically fixed at birth, that the trans woman was therefore legally male, and that the marriage was invalid based on the state's law restricting marriage to different-sex couples (*Littleton v. Prange,* 1999). Similar decisions created uncertainty and placed trans spouses in legally vulnerable situations.

The landscape for trans spouses who married a different-sex spouse *before* they transitioned was different. In those cases, even though both spouses were of the same sex after the trans spouse transitioned, every court to rule on the issue held that the marriage was valid, based on the longstanding rule that the validity of a marriage is determined at the time the parties marry. Even so, the prospect of potentially having to go through litigation to test the validity of one's marriage was a major source of stress and uncertainty for trans people in this situation.

Validity of Marriages After *Obergefell*

With the Supreme Court's ruling that the legal right to marry cannot be restricted on the basis of gender, trans people no longer have to fear their marriages may be invalidated simply because they are trans. *Obergefell* applies retroactively as well as prospectively. As a result, it protects trans spouses who married before 2015 even in a state that, at the time of the marriage, barred marriage by same-sex couples. Today, a trans person's marriage cannot be invalidated on the ground that it is or was a "same-sex marriage."

Even today, however, a spouse may claim their marriage to a trans person is void based on fraud by claiming they did not know their spouse was trans at the time of the marriage. Especially after *Obergefell,* many courts would hold that even if such a claim were true, it would not invalidate the marriage. Others, however, might still accept that failure to disclose one's trans status is a sufficient ground to invalidate a marriage. To avoid this possibility, it is advisable to have a written relationship agreement acknowledging that one of the spouses is trans.

Trans Parenting Rights and Issues

Before marriage equality in 2015, when a court ruled that a trans person's marriage was invalid, the trans person could also lose their parental rights. In practically every state, the law provides that a husband who has a child through donor insemination is the child's legal father. However, if a marriage is held to be void, the husband's parental rights may be challenged. For example, in 2005, the Illinois Court of Appeals upheld a trial court decision that severed a trans man's relationship with his son, who was born through donor insemination. Even though the trans man had transitioned and been living as a man for over 20 years, the court held that he was legally female, that his 15-year marriage to his wife was invalid, and that he was not a legal parent to the couple's 10-year-old son (*In re Marriage of Simmons,* 2005). Another major effect of *Obergefell* is that, now that marriages cannot be voided simply because one of the spouses is trans, trans parents need no longer fear that their parental rights can be stripped away in cases where those rights depend on marriage.

Even today, however, parentage laws for people who use assisted reproduction to have children, as many trans people do, vary significantly from state to state. In most states, married couples who use assisted reproduction to have children are generally both recognized as legal parents so long as they comply with any legal requirements. Just as any other married couple in this situation should do, trans people should be sure they understand their state's laws before using assisted reproduction to have a child. Where possible, it is highly advisable for spouses who use assisted reproduction to have

a child to get a court judgment declaring that both spouses are the child's legal parents.

Legal protections for unmarried couples and individuals who use assisted reproduction to have children are even more varied. If a trans person has a child through assisted reproduction with an unmarried partner or as an individual, they should be sure to know and follow any applicable state parentage laws to ensure that their parental rights are protected. Importantly, there is no state in which a written agreement alone is sufficient to establish a person's legal rights.

Trans people may also become parents through adoption. Although no state bars or restricts adoption because a person is trans, informal bias and discrimination against trans people on the part of birth parents, social workers, and courts are still common.

Issues for Divorcing Trans Spouses

Because of the Supreme Court's decision in *Obergefell,* a divorce involving a trans spouse must be governed by the same legal process and rules as any other divorce. In practice, however, a divorcing trans spouse may face some unique challenges owing to courts' unfamiliarity with trans people.

One such potential challenge relates to the economic disadvantage faced by many trans people when they come out publicly as trans. When a trans person undergoes a gender transition, the stigma associated with trans identity may lead to job loss or reduced earning potential. Some trans individuals who had successful careers before transitioning experience no significant discrimination or loss of income. For others, however, transitioning may be financially and professionally devasting. Historically, this risk has been especially high for trans people who transition *after* developing successful careers and who are sometimes ostracized and thus unable to sustain their professional success after transitioning. Statistically, as a group, trans individuals are twice as likely to be unemployed as others and report high rates of workplace harassment and career interruption. Trans people of color face the highest rates of unemployment and economic marginalization.

Judges who are unaware of this pervasive discrimination may incorrectly believe that a trans person's loss of employment or reduction in income is voluntary. This can be critical because courts take income and earning potential into account when determining the amount of child or spousal support that a divorcing person must pay to their former spouse. When a judge incorrectly believes that a trans individual voluntarily quit their job or sought one with lower pay, the judge may impose financial obligations that are impossible for a divorcing trans person to meet.

For example, in 2007, the Washington Court of Appeals held that a trans woman could be jailed for her inability to pay child support at a rate based on her prior job as an auto mechanic, even though she was fired when she transitioned and was subsequently unable to find another job. The Court of Appeals upheld the trial court's finding that she was "voluntarily unemployed" (*In re Marriage of Stankovich,* 2007).

Divorce courts may unfairly penalize trans people in other ways, as well. Every state allows for "no-fault" divorce, which means that couples can seek a divorce for any reason, without assigning fault or blame to either party. But many still allow courts to factor in fault when allocating property or spousal support. In those states, a trans individual's spouse may attempt to portray the trans spouse's transition as selfish or otherwise culpable conduct that warrants assigning "fault" to the trans spouse. This can lead to disparate allocation of property and spousal support.

Similarly, a divorcing spouse may argue that the trans spouse's use of funds to pay for gender transition or loss of employment after transition had a negative economic impact on the marital estate. In such cases, a court can give the non-trans spouse a greater share of the marital estate or require the trans spouse to pay more spousal support.

Child Custody Issues

Courts increasingly understand that being trans is irrelevant to a person's ability to parent and so should not be considered as a negative factor in child custody cases. For example, in 1973, the Colorado Court of Appeals reversed the trial court's decision that removed custody from a trans parent who had transitioned. The Court of Appeals found no evidence that the transition or the parent's trans status negatively affected the children (*Christian v. Randall,* 1973).

Nevertheless, trans parents across the country still face bias and discrimination in courts when it comes to child custody cases. Courts continue to deny custody and visitation to trans parents based solely on biases, unsupported stereotypes, and fears. In 1997, for instance, the Missouri Court of Appeals severed contact between a trans parent and her children. The court looked to expert testimony that it could potentially be "emotionally confusing" for the children to see their father as a mother, even though there was no actual evidence to this effect (*J.L.S. v. D.K.S.,* 1997). In other circumstances, courts have required that the trans parent continue living in their birth sex or to stop crossdressing as a condition of continued custody or visitation. In some of these cases, parents who have not complied with these conditions have had their custody or visitation rights revoked. As recently as 2008, the California Court of Appeals upheld a trial court decision that kept the children in foster care and removed the father's custody because he sometimes wore feminine clothing in front of the children after being ordered not to do so (*M.R. v. Superior Court,* 2008; unpublished opinion).

One of the strongest biases against trans parents in the courts is the erroneous belief that the decision to transition is a selfish choice that places the interests of the parent above the interests of their child or may be harmful to the child. For example, in 2013, the Arizona Court of Appeals affirmed a decision denying custody to a trans parent on the ground that her gender transition allegedly caused her to be absent from her children. The Court of Appeals denied that bias or prejudice played any role in the decision, holding that if the parent's conduct in transitioning harmed her relationship with her children, this was a legitimate consideration in determining the child's best interests (*Tipsword v. Tipsword,* 2013).

Importance of Expert Testimony to Rebut Bias in the Courts

Because misinformation and bias about trans people may influence family court decisions, it is often advisable to anticipate and be prepared to rebut any potential prejudice or misconceptions. Often this requires bringing in an expert who can educate the court about the current medical consensus regarding trans people. In a custody dispute, it is especially important to educate the court that being trans does not affect a person's ability to be a good parent, that having a trans parent does not harm children, and that supporting a continued relationship between the trans parent and their child is crucial for the child's long-term well-being. The best experts are medical professionals and mental health professionals who actively work with families that include trans individuals, as they can speak about the issues from their own experience while also understanding the current medical standards of care.

In conclusion, while trans people and their families have many more legal rights in 2020 than they had in the past, there are still barriers to equal treatment in child custody decisions and divorce proceedings. These barriers tend to come from unsupported stereotypes and biases within the legal system and can be successfully overcome with the use of expert testimony and appropriate efforts to educate decision makers.

Masculinities

Trans masculinity is an umbrella term for people who lean more toward the masculine than feminine side of the gender spectrum (e.g., presentation, identity, or roles) and includes (but is not restricted to) trans men, demi boys, genderfluid, genderqueer, polygender, and nonbinary people with varying sexual identities. Whereas transmasculine people feel a connection to masculinity, not everyone identifies as male or wants to transition medically and/or socially. Some people prefer a genderqueer or genderfluid presentation. Trans masculinities are also inflected with cultural meanings of social class, race/ethnicity, and nationality and have undergone important evolutionary changes since the 19th century. This entry offers a general overview of transmasculine expression and evolution in the United States, including a discussion of social, medical, and technological developments that spurred its visibility and proliferation by the millennium.

Discursive Discoveries

Trans masculinity was invisible in histories of lesbian and queer identity until the late 20th century. Histories of gender and sexual nonconformity, migration, and social formation used a queer paradigm of gender performativity that folded trans men into lesbian history. For example, accomplished jazz musician Billy Tipton's masculinity was initially described as a clever improvisation or deceptive drag, which he used strategically to access the exclusive world of jazz musicians. Tipton's sartorial choice was celebrated as an example of women's historical defiance of patriarchy rather than an indication of his male identity. Similarly, adventurer and itinerant laborer Ralph Kerwineo was identified as a feminist pioneer who crossdressed to access better employment opportunities unavailable to women of color.

When Lou Sullivan published *From Female to Male: The Life of Jack Bee Garland* in 1990, a new decade of trans historiography emerged. With the aim of recovering and documenting past trans lives, historians borrowed some of the heuristic practices of queer and feminist historiography, contested others, and invented new ones that were specific to journeys of gender nonconformity. Thus, trans masculinity emerged as a separate identity, distinct from butch and lesbian history, with its own tradition of masculinities and male embodiments.

Normative Masculinity

Historically, trans men tended to embrace and perform the conventional, heteronormative masculinity of their race, ethnic group, and social class. Trans men, like Tipton and Kerwineo, concealed their breasts, donned male haircuts and clothing, and worked in male jobs. The masculinity they projected was not an intentional, postmodern queering of masculinity. Rather, it was the only means of authenticating their (internal) felt gender before testosterone treatment and genital reconstructive surgery became available in the 1930s. Trans men tended to live in small rural towns where they led quiet, ordinary lives; were known by male names; and dated heterosexual women. Some trans men owned property, settled down into long-term relationships and marriages, and raised families. Others, like Jack B. Garland and Dr. James Barry, traveled and served in the military. Trans men's performance of heteronormative masculinity was so convincing to their neighbors, friends, and coworkers that even when their sex was discovered, many men continued to live and be accepted as men in their communities.

Medical transition (e.g., testosterone and sex reassignment surgery) of the 1930s paved a road not only for reducing trans men's gender dysphoria and anxiety of exposure but also for bodily substantiating their masculine performativity with male secondary sex characteristics (e.g., facial hair, muscularity, fat distribution, male hairlines, baldness, chest pectorals, and a penis). Michael Dillon is the first known trans man to have undergone a full medical transition, starting with testosterone in the late 1930s and completing phalloplasty in 1949. Most trans men continued to rely on a performative masculinity over the next two decades until medical transition became a treatment for transsexualism in the late 1960s.

Gender clinics, established in the 1970s, had an impact on trans masculinity. In their screening process, gender clinics used a heteronormative model of transsexualism formulated by the American Psychiatric Association (APA) to determine who to

admit. Many trans men who were attracted to men and/or unconventional (i.e., gender fluid) in their masculine expression encountered hurdles in the application process. When the Standards of Care opened alternatives to medical transition outside the gender clinics in 1979, gay, bisexual, and genderqueer trans men, like Lou Sullivan, took advantage and transitioned. Other early pioneers of the trans movement, like Steve Dain, Rupert Raj, and Jude Patton, embraced a continuum of trans masculinities and sexual identities in support groups and newsletters they founded and maintained.

Trans men began discovering one another in the 1990s and built a global network of information exchange and activist organizing. James Green, who took over Sullivan's support group and newsletter in 1991, held a fluid view of trans masculinity that included queer, nonnormative gender expression, and sexual orientation. Others, like Mario Martino, who published the first autobiography by a trans man in 1977, embraced dominant, binary models of masculinity as tough, stoic, authoritative, competitive—and at times, chauvinistic toward women, queers, and gender-nonconforming people. Trans men splintered into two camps. One viewed transition as an open-ended journey of exploring and experimenting with different gender presentations and sexual desires, while the other emphasized the medical model of transition as a predetermined, linear progression to heteronormative masculinity. Exacerbating these tensions were other developments such as evolving designations for trans people and FTM/butch border wars, which continued well into the 2000s.

Millennial Masculinities

During the 1990s, queer and feminist theorists tended to analyze trans subjectivities as proof that gender is performative and devoid of underlying biological influence. Academics intertwined trans and lesbian masculinities together in a continuum of masculine gender performativity, at the center of which lay the figure of the transgender butch. That assigned-female-at-birth (AFAB) people could change their gender, be seen, and be accepted as men in society made their masculinity appealing to theoretical deconstructions of the sex/gender binary. The trans-butch continuum made many trans men feel uneasy because of the almost exclusive focus on similarities between butches and trans men, which erased trans men's distinct male identity. For example, when Brandon Teena was murdered in 1993, lesbian writers memorialized Teena as a crossdressing lesbian and transgender butch, while trans men remembered him as a transgender man. Trans men also felt that the performative portrayal of their masculinity and trans-butch continuum minimized the (physical and social) differences of male embodiment and downplayed their arduous paths of medical transitioning. In contrast to gender theory's inclinations to celebrate the revolutionary impact of gender bending to upend the sex/gender binary, Teena's murder illustrated that trans masculinity could not be divorced from the corporeality of sex and the reality of violence. The trans-butch continuum was also ill-fitting for trans men with heterosexual pasts, feminine presentations, and no connection to queer communities.

Trans men's sensitivity to their erasure also influenced their objections. As they discovered their historical existence, they also learned about its erasure as the dominant culture designated them as crossdressing females when their sex was discovered. Moreover, trans men were not as visible as trans women, who outnumbered them in media coverage, gender clinics, and trans organizing at the time. Thus, trans men were hypersensitive to being erased by queer theories and histories that blurred their masculinities and pasts with butch/lesbians.

Self-Aware, Self-Made

Documenting trans men's existence around the world, new books hailed a broad range of bodies, masculine styles, body modifications, and sexualities in various stages of transition. Unlike trans masculinities in the 19th and 20th centuries, which embraced conventional masculine roles and presentations, trans masculinities proliferated into a diverse array of gender expressions and sexual orientations in the 1990s.

Trans men developed their own organizations, conferences, and communities at the turn of the millennium. They began to scrutinize their masculinity—celebrating, critiquing, and creatively constructing it. Many trans men came from queer and feminist backgrounds with a critical awareness of

male dominance, racism, and capitalism, which shaped their transition experiences. They transitioned with trepidation of being co-opted by hegemonic masculinity and were leery of unwittingly reinforcing its toxic patterns and practices—some criticized toxic masculinity, deconstructed male privilege, and explored ways to undermine it. Trans conferences, like Gender Odyssey and Philadelphia Trans Health Conference, included workshops, speakers, and presentations that examined ways to navigate transition without replicating the worst behaviors of white cisgender (cis) men. Some trans men also celebrated elements of traditional masculinity and explored shifting feminist views of male sexuality and culture.

Trans men of color complicated the critical discourse of trans masculinity. They called attention to their tenuous relationship to hegemonic masculinity and experiences of transitioning to a gender inflected with racial stereotypes of Black, brown, and Muslim men as criminals, terrorists, illegal aliens, and sexual predators. While transphobia delegitimized all trans men's claims to masculinity and maleness, systemic inequalities (e.g., race/ethnicity, class, and citizenship) intersected with anti-trans sentiments, which undercut trans men of color's access to male privilege and made them more vulnerable to police brutality, Immigration and Customs Enforcement raids, and white vigilantism.

The advent of the Internet and social media enabled the proliferation of trans masculinities as trans men created websites and social media pages of vlogs, blogs, and zines detailing their transition journeys. Cultural productions, like *Original Plumbing, FTM, TransGuys,* and *FTM International,* unpacked the intersectional politics of dominant white masculinity and treated transition as a choose-your-own-masculinity journey. Trans men discovered that, while being AFAB had a number of challenges, it also meant that they had an advantage over cis men. Unlike cis men, who are forced as boys into conventional molds of masculinity, trans men can explore their gender and sexuality with more freedom and an awareness of men's contribution to women's oppression. Many zines and websites were structured similarly to those for cis men (sans the sexism and misogyny), circulating advice about fitness/health, hairstyles/clothing, dating/romance, safe sex, positive body image, and self-acceptance.

20th-Century Proliferations

In the early 21st century, trans masculinity became more visible across the world. Trans men had crossover appeal to cis gay male and heterosexual audiences in the fashion and entertainment industries, showcasing diverse masculine styles and sexual orientations. Buck Angel, an adult film star and owner of Buck Angel Entertainment production, won numerous awards for his performances. Angel's films eroticized trans male bodies as both desiring and desired subjects, particularly in relation to cis gay men, BDSM, and kink culture. His audacity was groundbreaking because the mainstream and gay media tended to portray trans men as sexless. Yet, his films had the unintended consequences of gay male viewers fetishizing trans masculinities, which made some trans men uncomfortable and reinforced their body dysphoria.

Thomas Beatie became known as "the pregnant man" in 2007 and again exemplified the flexibility of trans masculinities to encompass a range of nonnormative desires, sexual morphologies, and reproductive capacities. Beatie appeared on talk shows, on cable news networks, and in mainstream magazines across the United States. His documentary, *Pregnant Man,* garnered the highest Nielson ratings for Disney Networks in 2008, and he published his memoir later that year. Beatie's pregnancy blew the lid off assumptions that biology is destiny, but the media's treatment of his story made some trans men feel uneasy that trans masculinity was being exploited and ridiculed as freakish and feminine.

Trans men such as Kingston Farady and Laith Ashley projected masculinities that were less easily co-opted. In 2016, Aydian Dowling became the semifinalist in a nationwide competition of men to appear on the front cover of *Men's Health* magazine. Images of an attractive, confident, and self-accepting trans man circulated around the world, not only making trans masculinity more visible to the larger cis world but also dispelling dominant representations of trans men as tragic figures. Finishing in second place with 72,000 votes, Dowling demonstrated that trans masculinities are as attractive and desirable as cis masculinities, scoring a major victory for trans men's visibility. Filmmaker, entrepreneur, and media specialist Kortney Ryan Ziegler produced the first

feature-length documentary exploring the lives of Black trans men in *STILL BLACK: A Portrait of Black Transmen* (2008). His film and subsequent blogs and media productions gave voice and visibility to men and masculinities of color who suffered an additional layer of invisibility in trans and queer contexts.

Measurement/Assessment Issues in Research

Measurement and assessment of gender includes efforts to quantify or label not only the experience of gender identity but also multiple dimensions of gender such as gender expression, body satisfaction, gender dysphoria, and gender-related minority stress. Measurement of dimensions of gender (e.g., identity, dysphoria, or minority stress) may occur at one point in time or may be used to characterize trajectories of gender development over time. Precise, acceptable, and sensitive gender measurement is critical for research and clinical care with trans people and people across the gender spectrum. Multidimensional and developmentally appropriate measurement promises to support faster, more tailored, and more precise affirming care, as well as to support improved understanding of anticipated development (e.g., gender trajectories, body image) and associated support needs for trans people and families (e.g., gender-affirming medical intervention, gender-focused body image support and/or eating disorder prevention, family support groups). This entry covers existing and historical gender measurement approaches, including functioning of assessments as well as the state of emerging instruments that attempt to address historical gender measurement challenges. Measurement of various aspects of gender identity and body image is relevant for research and in many clinics where trans people seek affirming care. Even clinics that rely predominantly on an informed consent model may administer questionnaires to support clinical planning.

Historical Measurement

Depending on the timing (1970s to about 2010) and the context (countries, state), clinical questionnaires have tended to measure concepts such as gender dysphoria, childhood gender behaviors, and body image. Initially, they were used to provide information regarding an individual's appropriateness for gender-affirming services, such as puberty suppression or hormone therapy. Original measures of domains like gender dysphoria, body image, and identity entailed challenges because they were written in such a way that assumed a gender binary (male/female) and, in turn, had many underlying assumptions embedded in the questionnaire items (e.g., they assumed that trans people would hate certain body parts or would desire to transition from one binary gender to "the other" binary gender). Global cultures have shifted dramatically in recognition of a broader range of gender diversity, creating a need for measures that capture a full range of the multiple dimensions of gender. There is also now increased recognition of

the fundamental right of the individual to self-determine gender, meaning that measures do not play the same role in informing decisions related to appropriateness for gender services (e.g., puberty suppression, hormone therapy, or surgeries) as they once did in some settings. For all of these reasons, clinical use of early developed binary gender measures has increasingly fallen out of favor. A large number of gender-specialized therapists now opt for a narrative approach to diagnostic care (defined as an approach that limits preordained categories, describes what is known and unknown, and provides an opinion in narrative form), based on the guidelines for gender dysphoria in the fifth edition of the American Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders* (*DSM-5*).

Binary measures based on assigned sex are problematic not only for clinical care but also for longitudinal research. An individual may need to change versions of an instrument (e.g., from the male version to the female version) after they change how they identify, which could mean they are then answering different item sets. For example, the original versions of the Utrecht Gender Dysphoria Scale were factored separately based on assigned sex, resulting in one version with emotionally laden items and the other with more instrumental and pragmatic items. If an individual changes which version they are using, there are psychometric challenges for longitudinal analyses, which rely on a continuity of measurement over time. Another widely used gender-related instrument, called the Body Image Scale (BIS), which was created in 1972, asks about satisfaction with specific body parts and uses separate versions based on assigned sex. The underlying assumption of the instrument is that if an individual experiences a change in their gender identification (e.g., from male to female), they no longer will report satisfaction with male-specific body parts but will immediately report on all female-specific body parts. This does not reflect the reality of gender-affirmative care, which often unfolds over time. This scale also lacks attunement to the lived experience of many gender-diverse individuals who experience themselves to some degree outside of the gender binary and would not want to be limited to one version of the instrument. Finally, for many trans people, especially in the United States, surgical interventions are financially unavailable or something they do not want; these individuals may retain body parts that would be absent if only one form were used. A more properly attuned measure would allow everyone to use the same instrument and respond to each item, regardless of assigned sex or current identity.

Research and Clinical Needs in Measurement

For research, measures are needed that independently capture the multiple relevant dimensions of gender (e.g., dysphoria, identity, or body image) as well as measures to assess cultural and contextual factors related to gender, such as minority stress, family environment, or gender roles. In longitudinal research, it is important that all individuals respond to the same version of the measure, regardless of assigned sex at birth, current identification, or transition process. Measurement validation, which is defined as building scientific support for a measure through establishing that it is reliable across contexts and produces valid measurement of the intended construct, would need to include aspects such as examining variability across multiple gender identity groups, prediction of minority stress or well-being, and/or linkages to treatment requests or outcomes.

Clinically, measures may assist trans persons and therapists in the process of developing a comprehensive treatment plan. For example, self-report on measures of family support, sexual health, genderqueer identity, gender literacy, and body image may provide in-depth assessment to support tailoring physical interventions for transition (immediate or delayed, high dose or low dose, etc.), psychoeducation programs to promote peer support and resiliency, and perhaps family therapy to help develop support among ambivalent family members. Some individuals may be able to provide more detailed information about nuanced aspects of gender identity on a structured measure than during an open-ended interview. Measures may also be relevant for clinical monitoring, such as assessments given over time to determine whether gender-affirming interventions and supports are associated with change in presenting concerns. Finally, measures of gender dysphoria/incongruence and body image can also support

trans individuals and clinicians in developing psychosocial or therapeutic goals concurrent to gender-affirming physical care.

State of the Science

Currently, measures of development and validation for transgender-affirming care is an area of research with limited support from traditional funding sources. Despite that, significant efforts have produced a variety of transgender-specific measures to support both gender-affirming care and research on psychosocial outcomes. Nonbinary versions of traditional clinical measures have been developed and are used in some clinics. Increasingly, large-scale surveys are including items to capture gender identity and expression. Additionally, consideration is now being given for how best to score mental health measures typically scaled and scored by assigned sex (e.g., the Child Behavior Checklist). Instruments designed to specifically measure transgender experiences such as gender minority stress and resilience, transgender congruence, or genderqueer identity are also increasingly common.

When measures are developed within a specific population, analyses need to be nested within subgroups to be certain that they fully capture the range of relevant experiences and identify powerful items that are differentially important across subgroups. Some items may be important in some subgroups but less relevant for other categories. For example, a question about shoulders may be quite influential in measuring body satisfaction for trans women but have less influence on the measure for people with a nonbinary identity. Ongoing efforts in measurement and assessment have begun to examine the distinct power of different items within different groups.

Medicine

The practice of transgender medicine includes the prescribing of medications to assist individuals with physical transition, enabling them to express their authentic gender identity. Gender-affirming hormone therapy changes secondary sexual characteristics so that they become aligned with one's experienced identity. This usually leads to a decrease in gender dysphoria. Medical providers determine the appropriate doses and routes of administration and monitor for side effects. Collaboration with other specialists, including therapists and surgeons, is often essential in assisting the individual through the transition process. Many providers are also involved with training the next generation of medical clinicians.

Trans patients now have better access to treatment than in the past, owing to increased availability of affirming providers and better insurance coverage for gender-affirming medical or surgical care. As societal acceptance of gender variance increases, future generations are likely to face less stigma and to seek medical care in increasing numbers. Notably, gender-affirming care continues to change in parallel to the changes in societal values

over the past century. This entry addresses transition-related psychological issues, gender dysphoria, history of medical transition, masculinizing and feminizing medications, puberty blockers, and fertility preservation.

Gender Identity, Gender Dysphoria, and Treatment

When a person's gender identity does not match their anatomical parts, including their genitals and secondary sexual characteristics, they have *gender incongruence.* If a person's gender incongruence creates psychological discomfort or distress that affects their quality of life, they have *gender dysphoria.* People may have dysphoria about having genitalia that do not align with their gender identity, having the presence or absence of breasts, having the presence or absence of facial hair, or other physical characteristics.

A person assigned female at birth may identify as male and experience distress due to lack of facial hair, lack of male genitalia, or presence of female-type breasts. Medical transition with testosterone can help masculinize their body, resulting in a lessening of the intense discomfort of gender dysphoria. Surgical transition with mastectomy with masculine chest reconstruction can also reduce dysphoria. Likewise, a person assigned male at birth may identify as female and experience distress at the presence of facial hair and the lack of female-type breasts. Hormonal treatment with estradiol can lead to the growth of breast tissue, while electrolysis can permanently remove unwanted facial hair. The goal for transition is to reduce the level of dysphoria and restore gender congruence.

Gender incongruence is not a mental disorder but rather an aspect of normal variation in human biology and experience. Prior to 2013, the fourth edition of the *Diagnostic and Statistical Manual of Mental Disorders* (*DSM-IV*) used the term *gender identity disorder.* This term stigmatized trans people as having a mental health condition even if they had no discomfort or distress. The term is no longer used and has been replaced in the *DSM-5* by *gender dysphoria,* which is distress caused by gender incongruence.

One dominant issue for some trans individuals lies in the psychological realm. It may take them awhile to become comfortable with the fact that they are trans—that is, that they are indeed the gender that they know they are, which is different from their assigned gender at birth. Then they may consider if, when, and how to come out. Some remain in the closet, while others gradually or quickly share this information with an enlarging network of people. Prior to transition, a trans woman may look in the mirror and see a 6-foot-tall male with a thick beard. She may be too pained to attempt to transition to a woman, or she may be undaunted by that visage and may plunge forward into a transition to her authentic self. As the human persona is quite complex and varied, there is no one-size-fits-all approach to gender transition.

Therapy and Transition

If a person is considering transition owing to gender dysphoria, they are encouraged to explore their gender identity and the process of gender transition. Family members, friends, and role models can be instrumental in helping with this. For some, this exploration can be done with support from a therapist.

Therapy can help a person clarify their gender identity and create an individualized plan for gender transition. Individuals may discuss how to come out at home, school, or work. The therapeutic alliance is often a source of support during the sometimes turbulent transition process. Trans people may need help in coping with expected and unexpected reactions. They may explore the different dimensions of transition—including social, medical, surgical, and legal.

Some individuals only transition socially, changing their name, pronouns, and gender expression (hairstyle and mode of dress). Those who pursue medical/surgical transition will need to decide when to pursue hormone therapy and/or gender-affirming surgery. Unfortunately, lack of financial resources or insurance coverage and lack of experienced gender therapists in one's region often prevent participation in therapy. Today, some trans individuals are so fundamentally comfortable with their gender identity and have enough social support that they may not feel the need to see a therapist.

In the past, treatment protocols from the World Professional Association for Transgender Health

(WPATH) required letters from mental health providers prior to initiation of gender-affirming hormones. In the United States, there has been a shift for adults toward an "informed consent" approach, which no longer requires such letters. Informed consent requires the adult patient to understand the benefits and the risks of transition-related medications and the medical provider to confirm the diagnosis of gender dysphoria prior to initiation of hormone treatment. The medical consequences of cross-gender hormones are quite protean; thus, it is important for patients to fully understand bodily changes that are likely to occur. The newer informed consent model in use today views letters from mental health providers as optional rather than mandatory for adult patients.

For patients under the age of 18, letters from experienced gender therapists are still usually required by many clinicians prior to hormonal transition. Parental consent of both parents is also required prior to initiation of medical transition for those younger than 18 years.

Trans People May Not Pursue Medical Transition

Trans people often face significant barriers to gender transition. Some encounter disapproval or rejection from partners or loved ones. Sometimes decisions are based on practical matters such as preserving a career or family relations; sometimes they are based on psychological issues such as self-doubt or shame. Many face financial, employment, insurance, housing, or legal obstacles to a smooth transition. Unfortunately, delay in transition often leads to persistence of gender dysphoria.

Some gender-nonconforming individuals do not experience dysphoria. They may have adequate social support affirming their identity. The realization that their body is different from their inner sense of gender may not cause distress. Thus, they may have gender incongruence without gender dysphoria and may choose not to undergo medical or surgical transition.

Many individuals do not identify as simply male or female. They may identify as a mixture of both, or as neither male nor female. These nonbinary, or genderqueer, individuals demonstrate that there is a wide range of gender experience for humans. They may be treated with lower doses of gender-affirming hormones to achieve desired results. A society that allows a continuum of gender identities and expression can help people discover their own authentic gender expression. Transcendence of simple binary male–female constructs is often helpful on the journey of gender exploration and transition.

History of Transgender Medicine

Medical and surgical assistance for gender transition began in the mid-1900s. Testosterone was isolated, and soon thereafter synthesized, in 1935. In 1939, Michael Dillon in England initiated masculinizing transition using oral testosterone. He later underwent surgical transition with staged phalloplasty, starting in 1946.

Identification and purification of estrone, one of the three main estrogens (feminizing hormones), was accomplished in 1929. Estriol was extracted from urine of pregnant women in the 1930s, and estradiol, the most potent of the three, was synthesized in the 1940s. The New York City endocrinologist Harry Benjamin was one of the first physicians to prescribe feminizing hormones, treating Otto Spengler with estriol. Dora Richter and Lile Elbe were two of the first trans women to undergo surgical transition in Europe in the 1930s.

Access to prescription hormones for medical transition increased with the establishment of university-based trans clinics in both Europe and the United States. The Johns Hopkins Gender Identity Clinic was established in Baltimore, Maryland, in 1966. Availability of medical providers who prescribe hormones for transition has gradually increased over the past 60 years. The medical approach to the trans patient will continue to evolve as additional research is available to guide treatment. The hormones used today are the same as those first used in the mid-1900s, but surgical procedures for trans patients have evolved rapidly.

Medical and Surgical Transition

There is a wide age range at which people initiate medical and surgical transitions. Medical treatment may begin in early puberty (Tanner Stage 2) when appropriate individuals receive puberty blockers to halt puberty. Older people may initiate transition in

their 60s or 70s, having finally found the freedom to express their authentic identity. Each transition is unique. Early protocols by providers and insurance companies required full social and medical transition prior to consideration of surgery, but newer protocols provide more flexibility by omitting such restrictions. Individuals may request hormones or surgery without any social transition or surgery without the use of hormones.

Those individuals who are interested in medical transition will need to locate a medical provider who can assist them. Many different types of clinicians prescribe hormones, including pediatricians, internists, endocrinologists, family physicians, gynecologists, psychiatrists, nurse practitioners, and physician assistants.

Medications used for medical transition include the masculinizing hormone testosterone, feminizing medications including estradiol and androgen blockers, and puberty blockers. Puberty blockers are a separate category of medications used in early puberty to halt the development of unwanted secondary sexual characteristics. "Puberty blocker" medications are different from "androgen blockers," and these two should not be confused.

Individuals seeking surgical transition usually need to obtain letters from one or two mental health providers, confirming readiness for the procedure. Common transition-related surgical procedures include breast augmentation, vaginoplasty, and facial feminization surgery for trans women and mastectomy with male chest reconstruction, metoidioplasty, or phalloplasty for trans men. Primary care providers should develop an understanding of available surgical procedures and identify experienced, affirming surgeons in their region in order to make appropriate referrals.

Compassion and competence on the part of medical providers is important. A knowledgeable and caring provider can support the patient medically and emotionally through a complex and often daunting set of challenges. The trans patient is often anxious about entering a medical system that may not understand or respect them. By showing concern and respect, and using chosen name and pronouns, clinicians can set the stage for a smooth medical experience for the patient. Also important is engaging in a thorough discussion about the benefits and risks of hormone therapy for gender dysphoria with the patient. Such dialogue can serve to solidify and enhance the relationship between medical provider and patient.

A complete history and physical exam is at the heart of assisting the trans patient in having a successful medical transition. Some individuals are "in a hurry" to experience the changes associated with hormone treatment, and in fact, some may have already begun taking hormones on their own, purchased on the Internet or acquired from friends. Regardless of these desires to "wave a magic wand" and wake up with a body that matches their true gender identity, a methodical approach to the administration of hormones is the optimal way to achieve the best results.

Indeed, a regular, ongoing dialogue between medical provider and patient regarding hormonal/medication treatment is important. Medication changes can be made slowly. After such changes, patients should be seen in a timely manner for follow-up, enabling the provider to note physical changes, review lab values, and assess the results of transition in all realms of the patient's life.

Medical providers routinely follow guidelines for medical and surgical transition. The Endocrine Society has published detailed Clinical Practice Guidelines on treatment of gender dysphoria since 2009. The World Professional Association for Transgender Health (WPATH) has published Standards of Care since 1979. The current Standards of Care Version 7, published in 2011, was updated in 2020. Medical and surgical transitions are considered medically necessary by WPATH, the Endocrine Society, and other mainstream medical organizations. Many medical insurance policies now cover transition-related services.

A Need for More Research

In certain areas, there is legitimate disagreement on medication protocols among clinicians, in view of the limited amount of scientific research available to serve as guidance. For example, the increased risk of pulmonary embolism due to estrogen administration is quantified in the medical literature, but the optimal way to maximize breast and hip enlargement in a trans woman remains unknown. Thus, some treatment regimens rely to a degree on "expert opinion," which can vary widely.

A growing body of research demonstrates that treatment of gender dysphoria through medical and surgical transition leads to positive outcomes, including improvements in gender dysphoria, quality of life, and psychological health. However, many of these preliminary studies were observational or retrospective studies, enrolled small numbers, and lacked control groups. Additional robust relevant research is needed to help guide care in this area. Although an increasing number of medical providers are now offering trans-specific medical care, many patients have difficulty finding knowledgeable, gender-affirming providers and medical practices in their community. Many individuals still have to travel long distances to procure competent and affirming care.

Masculinizing Hormones

The treatment of the trans man is straightforward: testosterone. Masculinization will occur gradually over years. The effects of testosterone are divided into irreversible and reversible effects. Irreversible masculinizing effects include development of facial hair, lowering of the pitch of the voice, and enlargement of the clitoris. Growth of facial hair is variable, due in part to genetics and age. Some trans men will develop a robust beard in months, others will have gradual development over 2 to 3 years, and some will have more limited beard growth. In terms of voice pitch, a trans man will likely develop enough thickening of the vocal cords to lower the voice pitch after 6 to 9 months of testosterone treatment. The clitoris and hood can enlarge up to an additional 3 centimeters with masculinizing treatment.

Reversible effects of testosterone treatment include increase in muscle mass, redistribution of body fat, increase in libido, and cessation of the menses (menstruation). Indeed, testosterone treatment suppresses the pituitary gland's signals that trigger ovulation and monthly menses. Most patients will have cessation of menses after 6 to 12 months of testosterone administration. A small percentage of individuals may have persistent menses despite adequate doses of testosterone.

Many trans men feel a sense of calm after starting testosterone; rarely is there agitation. The literature reports possible side effects of increased irritability, anger, or psychosis, although these are not seen frequently in clinical practice. When such side effects do occur, lower doses of testosterone can be used to minimize these effects.

Undesired effects of testosterone include acne, vaginal atrophy, male-pattern hair loss, elevation of cholesterol, and increased red blood cell levels. Acne often worsens in the first year of medical transition and then gradually improves. This can be treated with routine acne medications or dermatologic referral. If vaginal atrophy causes discomfort, this can be treated with vaginal estrogens. Medications can also be offered to minimize male-pattern hair loss, if this is undesired.

Metabolically, the cholesterol profile can worsen, with elevation of low-density lipoprotein (LDL) cholesterol and triglycerides and lowering of high-density lipoprotein (HDL) cholesterol. Blood pressure may increase slightly, as may body weight. Elevated blood pressure or cholesterol levels can be treated with standard medications.

Elevated red blood cell level (hematocrit/hemoglobin) is a common effect of testosterone administration. At more extreme levels, elevated red blood counts increase the risk of stroke. When this does occur, reduction in testosterone dose, change in injection schedule, or removal of blood through therapeutic phlebotomy or blood donation can lower levels into safer ranges. There are few drug interactions with testosterone. Interaction with the blood thinner coumadin is one of the few of clinical relevance.

Monitoring of lab tests is recommended, including periodic tests of hematocrit/hemoglobin and testosterone levels. Total testosterone levels are followed by most providers. These are usually measured midway between injections. In complicated cases, free testosterone and sex hormone–binding globulin can be measured/calculated.

It tends to be easier to obtain adequate levels with injectable testosterone, so this route is usually recommended for initiation of medical transition. Injections can be done subcutaneously or intramuscularly. Subcutaneous injections use a smaller needle and may lead to less skin irritation, so this route is often preferred. Patients are trained to do home injections, which are self-administered every 1 to 2 weeks. Syringes and needles are prescribed in addition to the testosterone vials.

Oral preparations of testosterone are rarely used, due to problems with first-pass metabolism

by the liver, which leads to lower blood levels and possible liver inflammation. Some trans men get very satisfactory blood levels and physical changes from daily topical testosterone (gel or patch). Dose adjustments are guided by adequacy of masculinization, including cessation of menses, and results of blood tests. Testosterone is an anabolic steroid and has been misused by bodybuilders and other athletes for performance enhancement. Thus, it is regulated by the Drug Enforcement Agency in the United States as a controlled substance.

Feminizing Hormones

Individuals desiring feminization are prescribed estrogens and testosterone/androgen blockers. Estrogens feminize the body. Both medications cause a decrease in testosterone production. The androgen blockers also neutralize any action of residual testosterone in various tissues. This inhibits masculinization of the body and allows for a maximum level of feminization. The main estrogen prescribed is estradiol, the most potent of the three naturally occurring human estrogens. Estradiol can be administered orally, topically, or parenterally (pill, patch, or injection). Spironolactone is the androgen blocker used in the United Sates. It blocks the androgen receptor and, in addition, decreases testosterone production. Cyproterone acetate is another androgen blocker that is used widely in Europe and Canada but is not approved by the U.S. Food and Drug Administration in the United States.

Estradiol and spironolactone have numerous feminizing effects. These feminizing changes usually develop slowly, over months and years. Breast development will be stimulated. The response of the breasts to gender-affirming hormones depends on both genetics and the age of initiation of medication. A trans woman usually reaches maximum breast development after being on therapeutic doses of estradiol for about 2 years. If there is a desire to have an additional increase in breast size, individuals may undergo surgical breast augmentation. The risk of breast cancer may increase, since additional breast tissue develops.

Thinning of body hair occurs. Unfortunately, there will be no significant loss of facial hair or change in its rate of growth and no meaningful change in male-pattern bony facial features that developed during male puberty. Male-pattern hair loss usually is reduced. Some clinicians use an additional class of androgen blockers called 5-alpha reductase inhibitors (finasteride or dutasteride) to reverse unwanted male-pattern hair loss. Additional procedures used for feminization include electrolysis and laser removal of unwanted hair and use of hair transplants to address male-pattern balding. The pitch of the voice will not increase if irreversible lowering has already occurred during puberty.

There will be a redistribution of abdominal fat to the breasts and hips and an increase in percentage of body fat. Muscle mass will decrease. The skin will soften and become dryer. While there can be a pleasant sense of calm that comes from being on estrogen, these medications may not make one "feel like a woman." There is usually no change in social behavior and no change in sexual orientation.

A decrease in libido and in frequency of erections usually occurs, as does a change in the nature of orgasms. A decrease in size of testicles can lead to a reduction in sperm count and semen volume, leading to reduced fertility. The size of prostate usually decreases as well.

The most concerning side effects of estradiol are blood clots in the legs or lungs. These occur at higher rates in those over 40 years of age, in tobacco smokers, and most likely in tobacco "vapers." The manner of administration of the estradiol affects the risk of blood clots. Administration through a topical patch does not appear to increase the risk of these blood clots, unlike oral administration, which does cause increased incidence of blood clots. Thus, patches are used for patients who are at increased risk for blood clots, including patients with a history of deep vein thrombosis.

There is controversy about possible benefits of administering estradiol through injection compared with oral or topical routes. Anecdotally, injectable estradiol can be associated with a better sense of well-being in some trans women. There are also reports of resumed breast growth and breast sensitivity upon switching to injectable preparations. These reported clinical effects are not yet supported by published studies.

Other side effects of estradiol treatment include gallstones, weight gain, elevated liver

function tests, high blood pressure, excessive prolactin levels in the blood, and elevation of triglycerides. A mild decrease in red blood cell count often occurs, since testosterone stimulates red blood cell production.

Progesterone is sometimes added to estradiol and androgen blockers, for additional feminization. There are little published data about its effectiveness. Some patients report additional breast growth with progesterone administration after having been on maximal estradiol doses for years. Progesterone may also help with mood and libido.

Blood tests are done periodically to monitor hormone levels and follow metabolic parameters. The goal is to suppress testosterone levels into the typical cisgender female range, below 50 ng/dL. Blood tests are also obtained to monitor for low sodium and high potassium levels, which can be adverse effects of spironolactone. Red blood cell count can be monitored to rule out anemia caused by testosterone suppression. Clinicians monitor liver panels to detect elevations in liver enzymes due to estradiol or spironolactone administration.

It is unknown how long estradiol should be continued in older adult patients. Again, little data are available to guide clinicians. For patients who have intact testicles, cessation of estradiol may lead to increased testosterone levels with unwanted recurrence of masculinization.

Puberty Blockers

Puberty is sexual maturation, which includes the development of secondary sexual characteristics. For people assigned female at birth, this involves female breast growth, growth of pubic hair, and, later, menstruation. For people assigned male at birth, secondary sexual characteristics include development of pubic hair, growth of the testicles and penis, growth of facial hair, and lowering of the voice pitch.

The stages of puberty development are measured by the Sexual Maturity Rating (SMR) Scale, also known as the Tanner Scale. This scale relies on measurement of breast development, pubic hair growth, and testicular size. SMR Stage 1 is prepubertal; SMR Stage 5 represents full sexual maturation. The onset of puberty is usually between 9 and 12 years of age and occurs at older ages for males compared with females, as well as older ages for whites compared with African Americans or Hispanics.

The earliest medical interventions for trans youth are offered in early puberty, at SMR Stage 2. Puberty blockers known as gonadotropin-releasing hormone (GnRH) agonists may be prescribed. The effects are reversible. They put puberty on hold by affecting the hypothalamus-pituitary axis in the brain, giving the youth time to explore their gender identity. The GnRH agonists temporarily prevent the development of unwanted secondary sexual characteristics such as breast growth, facial hair growth, and lowering of voice pitch. They also stop menstruation. Puberty blockers are administered by injection (leuprolide) or implant (histrelin) and can be continued for a number of years. Progesterones are also used at times to slow down puberty.

Blocking puberty allows the individual to further explore their gender identity without having to worry about development of these unwanted secondary sexual characteristics. They give the youth time to decide about the initiation of hormones, which have more permanent effects. Gender-affirming hormone therapy is often added after a period of time for those individuals who clearly desire medical transition. Puberty blockers are expensive medications but are sometimes covered by insurance.

To develop strong bones and avoid osteoporosis, a person will need to be exposed eventually to some type of sex hormones (estradiol or testosterone). Thus, puberty blockers cannot be used alone indefinitely. A person will need to add hormonal therapy or stop the puberty blockers to allow a gonadal puberty to occur. Bone health is an ongoing area of research in trans medicine because of concerns about osteoporosis.

Fertility Preservation and Pregnancy

Prior to medical transition, options for fertility preservation should be discussed with people of childbearing age. Gender-affirming hormones may make a person less fertile or infertile. Patients interested in fertility preservation should be referred to a fertility center.

Trans women on estradiol may produce less sperm due to impaired spermatogenesis and testicular atrophy. Ability to maintain erections may

be impaired. The reduction in sperm count caused by estradiol is often reversible if hormones are stopped within 6 months. After longer periods of time, the impact on fertility may be irreversible. It is wise to bank sperm at a fertility center before initiation of hormones if one has a desire to have biological offspring.

Trans men will have cessation of menses and may stop ovulating while on testosterone. The long-term impact of testosterone on fertility in trans men is not completely understood. Oocyte (egg) and ovarian tissue preservation is an option prior to transition for trans men considering testosterone. The process is somewhat complicated, requiring 2 weeks of hormone injections to produce a hyperovulatory state, followed by needle aspiration for egg retrieval.

Discussions of fertility preservation are recommended for any trans youth considering puberty blockers. A comprehensive discussion of the impact of medical transition on fertility can be difficult for a 10-year-old. Nonetheless, discussions are held to inform patients and family members about the possible impact of treatment on fertility and the options available for fertility preservation. Experimental procedures to preserve prepubertal testicular and ovarian tissue are in development but not yet widely available. Costs of fertility preservation traditionally have not been covered by health insurance, although this may change in the future. Preservation of eggs/ovarian tissue is more expensive than sperm preservation. In both cases, annual storage fees are charged.

Trans men have gotten pregnant both unintentionally and intentionally despite having been on testosterone for considerable periods of time. Trans men are advised to stop testosterone treatment prior to attempting to become pregnant. The limited case reports of such pregnancies have shown pregnancy outcomes to be comparable to outcomes in the general population. For trans men who are sexually active with partners with male genitalia, contraception should be used in addition to testosterone if they want to avoid pregnancy. Testosterone alone is not a reliable form of birth control.

Financial Costs of Transitioning

There are often financial expenses associated with medical, surgical, and legal transition. These costs can be astronomically high and, of course, depend on the desires and needs of the person. Time off from work for doctor visits, psychotherapy, and hair removal are frequent expenses. Additional costs include travel and hotel expenses for surgical procedures. The cost of a new wardrobe and cosmetics for women are additional expenses often incurred.

Loss of employment because of discrimination or a change in career can be a direct result of transitioning. Some people may end their relationship with a partner, leading to significant costs of child support, alimony, and additional housing expenses. For legal transitions, there are administrative expenses and potential lawyer fees associated with name changes and gender marker changes on various documents. For some, even the cost of a legal name change can be prohibitive. These significant costs of transition often lead to delays in treatment. Fortunately, health insurance policies now often cover some transition-related procedures, defraying expenses for many individuals. With the advent of early recognition, acceptance, and treatment of trans adolescents, some of these costs can be avoided with prevention of unwanted secondary sexual characteristics through the use of puberty blockers.

Here are estimated expenses in U.S. dollars for various transition-related procedures, as of 2020:

Transmasculine:

Medication: $100–$250/year

Psychotherapy: $20–$250 per session

Mastectomy with male chest reconstruction: $7,000–$10,000

Phalloplasty: $40,000–$100,000

Metoidioplasty (procedures vary): $5,000–$60,000

Transfeminine:

Medication: $50–$500/year

Psychotherapy: $10–$250 per session

Voice therapy: $20–$150 per session

Electrolysis/laser hair removal: $1,000–$10,000

Wigs/semipermanent hair systems: $100–$7,000/year

Facial feminization surgery: $10,000–$75,000

Breast augmentation: $7,000–$12,000

Orchiectomy: $2,000–5,000

Vaginoplasty: $15,000–$50,000

Detransition

A small proportion of individuals (3%–4%) who have transitioned may decide to stop medical transition and "detransition," allowing their body to return to the characteristics of the sex assigned at birth. Reasons are varied for detransitioning, including lack of family or social support, difficulty with romantic relationships, employment difficulties, or side effects from medications.

If hormones are stopped, many of the bodily changes brought about by hormones will reverse. Permanent changes involving voice pitch, facial hair growth, and breast growth will not reverse after hormone cessation. Surgical procedures related to transition may be difficult or impossible to reverse. However, the vast majority of people who transition continue in their new authentic identity.

At times, there have been heated debates about the best way to assist individuals with gender dysphoria. The Endocrine Society guidelines emphasize that trans individuals need to have access to affirming care and appropriate medical treatment. The provision of affirming care has also been supported by the majority of mainstream medical organizations. Affirmation of gender diversity from family and schools also leads to improved outcomes for gender-nonconforming individuals. Deeper understanding of gender diversity leads to earlier recognition of gender dysphoria, more comprehensive treatment, and improved well-being for this population.

Mental Health

Many trans individuals report notable elevations in mental health concerns as a result of the social rejection and oppression that they are exposed to in their immediate and broader communities. Mental health disparities exist across a number of areas, such as depression, anxiety, and suicidality, as well as other forms of psychological distress. Drivers of these mental health disparities include exposure to adverse life events, minority stressors, gender dysphoria, and other contextual factors. Trans individuals who are supported in their identities experience benefits to their mental health and a reduction in health disparities. This entry outlines what is currently known about the mental health disparities reported by trans individuals and the factors that are driving these negative mental health outcomes. This is followed by an overview of several factors that may be associated with improvements in mental health, such as gender affirmation and coping. The entry concludes with an overview of research related to mental health services for trans individuals.

Mental Health Disparities

A systematic review of the literature has shown that the most commonly studied mental health concern for trans people is depression, followed by suicidality, general psychological distress, anxiety, and posttraumatic stress symptoms. Research consistently shows elevated mental health concerns among trans individuals when compared with cisgender (cis) people. These health disparities must always be understood within the social contexts in which they occur. Research also shows that trans people are more likely to receive mental health diagnoses at younger ages and to receive multiple diagnoses when compared with cis people. Most research that has examined depression and anxiety shows that approximately half of these samples of trans individuals report significant elevations in these mental health issues, with some research showing that these symptoms may fall into the moderate to severe ranges. When it comes to rates of suicidality among trans people, estimates vary depending on study samples and procedures but consistently emerge as elevated in comparison with cis people. For example, in an online study of trans individuals, as many as 95.5% reported lifetime suicidal ideation and 32.3% reported making a suicide attempt in their lifetime. In one of the largest studies of trans people to date, the 2015 U.S. Transgender Survey, 40% of participants reported that they had attempted suicide in their lifetime, 48% had thoughts about suicide in the past year, 24% had made a suicide plan in the past year, and 7% had attempted suicide in the past year. In a large sample of veterans in the United States, researchers found that trans veterans were more likely that cis veterans to report all of the following: alcohol abuse, depression, eating disorders, panic disorder, posttraumatic stress disorder, serious mental illness, and suicidal ideation and attempts. According to another study in the United States, the following rates of mental health issues were reported: 46% any mood disorder (9% cis comparison group), 31% anxiety disorders (6% cis comparison group), 6.7% posttraumatic stress disorder (0.52% cis comparison group), 10% substance use disorder (2.6% cis comparison group), and 58% at least one diagnosis (13.6% cis comparison group). Research in the United States also shows that levels of depression and anxiety among trans people may vary by region, with estimates highest in the West South Central division of the country. Other research has found differences across urban and rural locations in the United States, particularly for trans men, showing that trans men in rural areas have higher levels of somatization, depression, and anxiety compared with trans men in urban locations. Finally, younger trans individuals tend to report more psychological distress than older trans individuals. Even so, older trans individuals still have heightened levels of psychological distress, such as depressive symptoms, when compared with cis older adults.

Research in countries beyond the United States has shown similar findings, with levels of mental

health concerns elevated for trans people compared with cis people and being driven by social marginalization. Research with trans individuals in the United Kingdom revealed that trans individuals' risk for anxiety disorders was three times higher than that for cis people, with this somewhat more elevated for trans men compared to trans women. In China, research with trans individuals shows that about 32% report depression, 28.5% report anxiety, 21.6% report self-harm, 46.3% report suicidal ideation, and 12.8% report suicide attempts. These estimates are somewhat lower than what research often shows in the United States, but research on trans individuals' experiences in China is extremely limited. A study from Hong Kong also showed elevations in suicidality, with this sample reporting moderate levels of suicidality, 67% reporting a history of suicidal ideation, and 20.8% reporting a suicide attempt. Although a review of data from all countries is beyond the scope of this entry, it is notable that these select findings show similar trends to data in the United States.

Research that compares the mental health of nonbinary trans people to that of other trans individuals is only beginning to emerge, and there have been mixed findings in this area. Some research indicates that nonbinary trans individuals may report greater psychological distress compared with other trans people, but other research does not align with these findings. For instance, nonbinary trans people have been shown to report higher levels of depressive symptoms, anxiety symptoms, and hazardous alcohol use than do other trans individuals. Yet, other research shows that nonbinary trans people do not differ from other trans people in terms of rates of depression diagnoses or nonsuicidal self-injury. Ultimately, more research is needed in this area to generate more conclusive findings about subgroup differences in mental health.

Research with trans youth reveals similar findings to that for adults. Trans youth have been shown to have higher rates of attention-deficit disorders, anxiety disorders, depressive disorders, self-harm behaviors, and suicidality (including ideation and attempts) compared with cis youth. Trans youth also report higher levels of inpatient and outpatient mental health treatment than cis youth. One U.S. study found that 33% of the trans adolescents in their sample met criteria for major depressive disorder and 48% met criteria for generalized anxiety disorder. In a review of studies with trans youth, prevalence rates of depressive disorders and symptoms ranged from 12.4% to 64%, rates of suicide attempts ranged from 9.3% to 30%, self-harm prevalence rates ranged from 13.1% to 53%, and prevalence of eating disorders ranged from 2% to 15.8%. Other research also indicates that trans youth have elevated mental health concerns in comparison to cis sexual minorities in the areas of depression, suicidal ideation, and suicide attempts.

Most of the research on mental health in trans individuals fails to take into account intersections with other factors, such as education level or race. The U.S. Transgender Survey does provide some evidence that trans individuals with lower levels of education have higher levels of psychological distress compared with those who have more advanced degrees and education levels, as well as higher rates of attempting suicide in the past year and over their lifetime. The U.S. Transgender Survey also showed that rates of suicide attempts in the past year were elevated in participants of color compared to white participants. Most research to date has primarily included white trans individuals, with limited representation of trans people of color, and many improvements are needed in recruitment to better understand the mental health needs in trans communities of color.

Drivers of Mental Health Disparities

One framework that helps to contextualize these mental health disparities is the minority stress model. As this model explains, the elevated levels of psychological distress and mental health concerns reported by trans people must be understood within the context of a marginalizing society that stigmatizes trans individuals and privileges cis people. As such, unique stressors that trans people experience help to explain the disproportionate rates of mental health concerns in this community compared with people who are cis. The minority stress model has only recently been applied to the trans community; thus, this model still has room to be further developed and made more specific to trans individuals. Even so, the stressors that trans people have reported in the literature include the

overt, distal stressors in the minority stress model (e.g., violence and discrimination) and the more proximal stressors, such as internalized stigma and expectations of rejection. Some scholars have extended this line of work and identified additional stressors that trans individuals may be exposed to such as misgendering, vicarious stress, and transitioning identity stress. Although a full review of gender minority stressors is beyond the scope of this entry, a few examples are presented here to facilitate understanding of mental health disparities in trans communities.

At the societal level, trans people are faced with various forms of legislation and political rhetoric that portray trans people in negative, pathologizing ways and even restrict their access to resources and their ability to engage in everyday life. For instance, when legislation is passed that restricts trans people's access to restrooms, this inhibits their ability to engage at work, school, or other important life experiences. This type of social marginalization can significantly restrict trans people's access to resources, social advancement, and livelihood, all of which may have a detrimental impact on mental health.

At the enacted level, trans people may also face discrimination (e.g., as many as 50% of trans people across some research studies), violence (reviews suggest rates of 15% to 47%), and other displays of stigma. The rates of discrimination are further elevated for trans people of color compared with trans people who are white. Trans people also report significant rates of rejection from family, peers, and other important communities. This rejection has been associated with heightened levels of depression and psychological distress. At the proximal level, these (explicit and implicit) stigmatizing messages about trans people may become internalized and lead trans individuals to develop a negative view of themselves as gender minorities, lead to heightened expectations of stigma, and lead to fears of disclosing a gender minority identity or gender history. These distal and proximal stressors have been found to be associated with depression, anxiety, suicidality, and other forms of psychological distress. Furthermore, when exposed to distal stressors, trans people may see rises in proximal stressors, which can then mediate the associations between distal stressors and mental health. Research has shown, for example, that internalized stigma mediates the association between discrimination and depression in trans individuals. Overall, a variety of stressors that trans people face in their daily lives must be considered when evaluating mental health disparities in this population.

Gender Affirmation and Mental Health

A trans person's gender affirmation may include a variety of steps, depending on each person's unique gender experience, access to resources, safety, and other factors. Largely, gender affirmation can be thought of as a social affirmation and a medical affirmation. Socially, a trans person may change their name (via legal means or not), their pronouns, their appearance, or other factors to help align their gender presentation to their felt sense of their identity. Medically, a gender affirmation may include using hormone therapy or undergoing surgeries to help align a person's body and physical appearance with their sense of self. Both social and medical gender affirmation may help to alleviate gender dysphoria and have in turn been associated with positive mental health outcomes for trans individuals. Even so, accessing these services is complicated, and many trans individuals may not be able to do so because of financial reasons, lack of insurance coverage, limitations of an insurance plan, or fears of retaliation from family members. In addition, not all trans individuals pursue or desire to pursue medical means to affirm their gender, and there is no singular narrative that will capture this diverse community's experiences. Even so, for trans individuals for whom these forms of affirmation are part of their gender experience, research shows mental health benefits.

In terms of a social affirmation, studies have revealed that trans youth who are supported in affirming their identities have better mental health than youth who are not supported in affirming their identities. In fact, mental health disparities between trans and cis people become significantly reduced in youth who are allowed to affirm their gender identities. For trans adults, being called a person's chosen name rather than the name given to them at birth has been associated with lower levels of suicidality. Other research also supports that coming out and socially affirming one's gender are associated with positive benefits for mental health.

Medical gender affirmation is also associated with benefits to mental health for trans individuals. Research shows that when first seeking gender-affirming medical care, trans people report elevated levels of depression, anxiety, and posttraumatic stress symptoms. For instance, in some research, nearly half of adolescents who were seeking hormones to medically affirm their gender reported elevations in internalizing symptoms. This medical care has been shown to result in significant improvements in mental health. For adults, those who report having received puberty suppression treatment earlier on report less lifetime suicidal ideation than do trans people who did not receive such treatment. Thus, early intervention to alleviate gender dysphoria may be beneficial to the mental health outcomes of trans individuals. Other research has shown that, for adults who desire this care, gender-affirming medical interventions are associated with better mental health, including reduced depression and anxiety symptoms. Although less research has focused on associations with substance use, some studies also show that trans individuals who have received gender-affirming medical interventions have reduced binge drinking and injection drug use. Trans people who receive gender-affirming medical care have higher levels of life satisfaction and satisfaction with their bodily characteristics. Together these studies show that, for trans people for whom medical intervention is part of their gender affirmation, this care is associated with more positive outcomes in relation to their sense of self and mental health.

Coping in Relation to Stressors and Mental Health

Compared with the study of gender minority stressors, coping has been much less researched, and very little is known about what types of coping may prove most effective in managing gender minority stressors. Coping generally refers to an individual's attempts to manage stressors, and some forms of coping may alleviate distress (e.g., problem solving), whereas others may exacerbate this stress (e.g., internalization of blame). Most research has thus far examined single, particular forms of coping in isolation, such as avoidant coping, but it is important that future work take into account a multitude of ways of coping simultaneously to understand what coping profiles may most benefit mental health.

Research has shown that trans individuals earlier on in their gender affirmation may be more likely to use avoidant coping and that this may be a factor that helps to explain some of the elevations in depression and anxiety symptoms during this developmental period. Avoidant coping has also been found to mediate the association between victimization and depression for trans individuals. Only one study to date has examined multiple forms of coping simultaneously; this study suggests that trans individuals who report using higher levels of both functional and dysfunctional coping strategies have worse mental health than those who report high use of functional and low use of dysfunctional coping strategies. This work highlights that it is important to consider an array of forms of coping rather than solely measuring one coping factor.

Qualitative research has shown that trans people may have unique forms of coping with life difficulties, such as challenging gender norms and embracing less gender-rigid lifestyles. Quantitative research has yet to include these trans-specific forms of coping, mostly due to a lack of measures available for many of these types of coping. In addition, no research has examined more general types of coping in conjunction with trans-specific coping, which would provide a more comprehensive understanding of coping in this population.

Trans people's use of social support is one domain that has received more research than other coping resources. Having social support can be incredibly important for managing gender minority stressors, and higher levels of social support have been associated with less psychological distress for trans individuals. Most quantitative research to date has typically combined all forms of social support into a single variable or construct, conflating support from family with that from peers and other networks. Even so, research typically shows that higher levels of social support are associated with less depression, anxiety, and nonsuicidal self-injury. Different forms of social support may differentially relate to mental health. Research shows that support from one's family is associated with higher life satisfaction, less depression, less psychological distress, and higher levels of resilience. Research also shows that, when comparing support from one's

family, friends, and a trans community, the variable most strongly associated with mental health is family support. When grouping participants based on their levels of support across these domains, those with support in all three areas have the best mental health outcomes. Individuals with low support across these three domains are three times more likely to report severe anxiety symptoms than are individuals with high levels of support in these three domains. Research on the moderating effects of social support variables on the associations between minority stressors and mental health is in the early stages, but there is some research to suggest that family support and peer support may have a buffering effect on this association.

Mental Health Treatment

Many mental health providers currently receive little to no education on working with trans individuals, and often the education they do receive is substandard and pathologizing. The mental health field has a history of mistreatment and stigmatization of trans individuals that, in some ways, continues today. This history has resulted in limited knowledge on the part of providers and therapists regarding how to be affirming, and there is extremely limited research on best therapy practices with trans individuals. There is a dearth of research about trans-affirming mental health services, what constitutes effective mental health practices, and other related areas. Many trans people report significant barriers in accessing mental health services, which span financial barriers related to accessibility of mental health services, issues with mistreatment and abuse from mental health providers (e.g., harassment, being called slurs), microaggressions on the part of therapists or office staff (e.g., being misgendered and called by the wrong pronoun), and related challenges that make it difficult for trans people to engage in mental health services. Trans people also report viewing many therapists as being undertrained in working with trans clients and not knowledgeable about the potential needs of this population. Research also has shown that trans people may be reluctant to seek services when they have had negative encounters in therapy in the past and that they may be fearful of therapists taking on a gatekeeper role or engaging in pathologizing views of trans people. It also can be difficult to find an affirming provider, given that research shows that even providers who state that they work with trans populations and have expertise in this area may not be engaging in best practices. Interestingly, in the United States, there is a larger discrepancy between self-stated expertise in working with trans people and the practices of providers in states without legal protections for trans individuals compared to states with these protections. Nonbinary individuals may encounter unique challenges in therapy due to providers having internalized restrictive narratives about trans people's identities and lives. This may result in therapists inappropriately questioning nonbinary clients' identities and other microaggressions.

Some common areas that therapy with trans people may focus on include exploration of gender identity, supports for gender-affirming medical care, coming out and identity disclosure, family- or couple-level concerns, and other general mental health concerns such as depression and anxiety symptoms. Thus, the work of therapy with gender minorities may focus on the unique life experiences that this group goes through, gender minority stressors, unique strengths of being a gender minority, or the general types of mental health concerns that anyone may come to therapy to discuss. Even when focusing on general mental health topics, it is important that mental health providers incorporate gender into their case conceptualization to ensure that they are attending to the client's identities and how these aspects may relate to their life experiences, relationships, expectations for their future, and other important clinical topics.

Research shows that many trans people may seek out a therapist or mental health services. In the U.S. Transgender Survey, 58% of the participants reported that they had received mental health services, and even more, 77%, reported wanting mental health services. Even with this high rate of service utilization and interest in therapy, many trans people continue to report harmful and damaging experiences in therapy due to provider bias, microaggressions, and other issues. This highlights the urgent need for affirming mental health practice with trans people.

Much of what has been written about affirming mental health practices has been from the perspective of trans-affirming therapists, whereas limited

empirical research has evaluated how affirming these actions are for trans clients. In addition, research focused on the effectiveness of mental health interventions has often not included trans people or has not measured gender in inclusive ways to identify trans participants. In turn, little is known about whether the effectiveness of established therapy interventions for issues such as depression may be as effective with this population as compared with cis individuals. Treatment effectiveness research is needed that considers the unique needs of trans individuals and adaptations that may improve therapy outcomes.

Given the lack of research in these areas, it is unsurprising that it was not until 2015 that the American Psychological Association published its first version of guidelines for affirmative practice with trans individuals. These guidelines focus on specific practices and general guiding principles that therapists can implement to become more culturally competent and trans affirming. Em Matsuno and Tania Israel have also proposed a framework that may help therapists in supporting trans clients to develop resilience and have improved mental health. Their framework includes strategies to bolster individual resilience factors, which include hope, self-acceptance and pride in a trans identity, self-definition of identity, self-worth, and gender affirmation. Their model also includes group-level factors that may promote resilience, which include being a role model for others, belonging to a community, familial acceptance, having positive role models, social support, and trans-focused activism. Mental health providers can use interventions that target these areas to decrease psychological distress and promote well-being.

It also is the case that many trans people come into contact with mental health providers when they are seeking gender-affirming medical care because of outdated expectations of receiving a letter of support for securing such care. It is important to note that therapeutic encounters may at times include this evaluative focus that can hinder a focus on mental health. Some trans people report that mental health providers express hesitancy to provide such letters of support when trans people report psychological distress, and this may result in trans clients not receiving care that may benefit their mental health.

It also is important to note that trans people may also be exposed to harmful practices, such as "conversion therapy" or practices that discourage a person from affirming their gender identity. In fact, in the U.S. Transgender Survey, 18% of participants reported that a provider tried to discourage them from being a member of a gender minority. This type of harmful practice has been associated with psychological distress and lifetime suicide attempts for trans individuals.

Conclusion

It is clear from past research that a variety of contextual factors disproportionately tax the mental health of trans individuals, such as harassment and violence, which result in mental health disparities. Trans people report greater levels of depression, anxiety, suicidality, and other mental health conditions than do cis people. These findings have been replicated in a number of countries. There are important intersectional considerations, with younger trans people reporting greater psychological distress than older trans people and trans people in rural areas reporting more distress than those in urban areas. Research has demonstrated that minority stressors are associated with these mental health concerns and may help to explain disparities. Furthermore, trans people display a range of strategies to cope with these stressors and the associated distress that arises. Finally, mental health services tailored for trans people are severely deficient at this time, and research on mental health treatments often fails to take into account the generalizability of findings to this community. More research is needed to identify the most effective and affirming means of decreasing these rates of mental health issues.

Mentoring

Mentoring is an informal relationship that is mutually beneficial to two parties. While mentoring might include aspects of advising, coaching, and helping, it is a unique phenomenon that includes being relationship oriented and engaging over a long period of time. Mentorship strives to be more than transactional and benefits from prolonged engagement where the mentor–mentee pairing can connect on issues that relate to professional and personal life. A mentor may be a person within a given field of work or study who helps a mentee navigate the politics of a field, search for a job, network, or develop necessary skills to be successful. This entry explores the general aspects of mentoring and then provides considerations for mentoring trans communities.

Mentoring Relationships

Mentoring is developmentally driven, meaning that each person in the relationship works to help the other person with growth in a predetermined area or areas that arise such as vocational success or interpersonal skill development. In more formalized mentoring relationships, there is strategic design, meaning that a purpose for the relationship is clear, intentions are set, and there is a plan for engagement for both the mentor and the mentee. Mentoring relationships, while structured, often take a more natural form within the relationship, meaning that the mentor and mentee are friends and build a friendship across time. Mentors and mentees talk *with* each other, rather than giving directions *to* each other. Mentors can be teachers, professors or other faculty, academic advisers, in a workplace setting, or in the local community.

Identity Considerations for Cis Mentors

In trans communities, the mentor/mentees' social identities play an important role. Those who identify as cisgender (cis) should ensure that they have thought deeply about the life experience and challenges that trans mentee's experience. If cis mentors are unable to understand the trans mentee's experience, trans mentees may find it hard to connect with cis mentors. Being knowledgeable about trans experiences takes the responsibility off the trans person to educate the cis mentor and makes for a safer and more comfortable environment where mentorship can happen without impediment. Cis people mentoring trans mentees should also consider the privileges that they have had in their personal and professional journeys. This consideration includes being mindful in understanding that they may have experienced fewer challenges because of their identification with the dominant group.

Identity Considerations for Trans Mentors

Mentors who identify as trans have a unique opportunity to talk about their own experiences as trans people with trans mentees and give them the space they need to grow in their own identities. Research suggests trans mentorship may be especially important because trans mentors have the ability to share how they have navigated unsafe or oppressive spaces, as well as the everyday tasks that can be daunting for trans communities (e.g., using the restroom in the workplace, coming out to peers, navigating physical and emotional changes related to transition).

Identity Considerations for All Mentors

No matter if a mentor is trans or cis, other considerations of identity are particularly important to reflect upon. These considerations include the race and/or ethnicity of a mentor/mentee pairing. Understanding how racism affects a mentee is particularly important because trans people of color, particularly Black trans people, are disproportionately discriminated against and have more violence enacted upon them. Classism is another system that should be considered. Mentees who come from a background of lower socioeconomic status may have fewer opportunities to engage in the types of development that a mentor may suggest and may have less access to resources like housing, financial support, "professional" clothing, and social engagements, which can affect their long-term success.

Some other considerations for mentoring trans people are the extra barriers they face, which can make their professional and personal relationships more difficult. Many trans people use names and pronouns that are different from those assigned to them at birth. Navigating using a different name and pronouns, as well as navigating the legal name change process, can be difficult and cause trans mentees much stress in searching for educational, professional, or other opportunities that may require the revealing of their "deadname," the name given to them at birth.

Resources for Trans Mentees

One role of a mentor is to help mentees find support resources. For example, mentors should help mentees to find organizations in their geographic area that support both financial needs and mental health around the process of seeking out a legal name and/or gender marker change. Additionally, if a trans person is choosing to transition socially or medically, significant anxiety around their gender presentation and how the world perceives them may occur. For example, a nonbinary person may present and be perceived along the gender binary and present in a way that causes them gender dysphoria.

Conclusion

There are a number of important considerations that mentors would do well to keep in mind with regard to trans mentees. People who mentor trans people play an important role in helping mentees to navigate the process of identifying needed resources. Such resources may include health care to access medical transition, therapists, support groups, and finding space to be in a community with other trans people. Knowing about these resources in the community is an important consequence of the successful mentorship of trans individuals. Ultimately, mentorship is about listening and creating a relationship, rather than simply giving directions. For this reason, it is highly important to listen to trans mentees and their needs—what mentees need to feel most safe, what can help them feel more successful—and then draw on the resources available to provide them with the best support systems possible.

MICROAGGRESSIONS

Microaggressions are social exchanges in which a perpetrator explicitly or implicitly communicates a harmful, stereotypical, and dehumanizing message against a marginalized individual and/or community. Trans people experience verbal and nonverbal microaggressions on interpersonal, institutional, and systemic levels, and these experiences can result in gender minority stress that can negatively affect a trans person's mental health and well-being. What follows is a description of the three types of microaggressions, specific examples of trans microaggressions, the potential impact of microaggressions, and a brief summary of microaggressions and trauma.

Brief History of Microaggressions

The Civil Rights Act of 1964 made racial macroaggressions—racial segregation in public spaces

such as bathrooms, schools, and hospitals—illegal by deeming explicit and intentional racial discrimination against U.S. law. However, nonwhite groups such as Asian, Asian American, Pacific Islander, and Southeast Asian; Black, African American, Caribbean, and African; Indigenous, First Nations, and Native American; Latino, Latina, Latinx, and Latine; and mixed-race people of color continue to experience implicit and unintentional racism that is often undetected and invisible as well as legal. As a result, the term *microaggression* surfaced in the 1970s to capture the experiences of nonwhite people and prove that racism was not extinguished from U.S. culture but rather that racism had taken on a more clandestine form. In a groundbreaking article about racial microaggressions, a team of researchers of color expanded the concept of microaggressions into an umbrella term (Sue et al., 2007).

One of the most important characteristics of the framework of microaggressions is that *micro* does not refer to something that is small; rather, the prefix refers to the invisibility of an insulting message or action. The perpetrator is usually unaware of their complicity in perpetuating harmful stereotypes, but the underlying message is usually painfully clear to the marginalized person who has been affected by the microaggression. Similarly, the prefix *macro* in *macroaggression* does not refer to something that is big but describes messages or actions that are visible to almost everyone in society since the messages and actions are public and, in most cases, legal. The framework of microaggressions comprises three different categories: microassaults, microinsults, and microinvalidations.

Microaggression Categories

Microassaults are intentional, and the perpetrator is usually very aware that what they have said or done is offensive; however, the perpetrator generally believes that their offensive behavior will cause a minimally harmful impact—an incorrect assumption in most cases. *Microinsults* are unintentional, and the perpetrator is usually unaware of the harmful underlying messages contained in what they have said or done. *Microinvalidations* typically occur in response to being called out on a microassault or microinsult, but microinvalidations can also occur independently.

It is useful to have three categories of microaggressions, since some microaggressions are explicit (e.g., microassaults) and some are implicit (e.g., microinsults and microinvalidations). Given that perpetrators are usually unaware of their implicit biases and how they perpetuate harmful stereotypes, perpetrators frequently become defensive when called out on their offensive language and therefore cite that they did not intend to cause harm. This type of defensive response prioritizes intention over impact, which further negates, insults, and invalidates the marginalized person's experience. Therefore, it is critically important to prioritize understanding the impact over intent after committing a microaggression.

Examples of Trans Microaggressions

One of the most common examples of trans microaggressions is being mispronouned. Using the incorrect pronoun can be a microassault if the perpetrator uses it intentionally, for example, and especially if they know the person's correct pronoun but refuse to use it. This is a typical experience for a trans person who has heard the statement: "I am not using 'they' as your pronoun because it is grammatically incorrect." Being mispronouned can also be a microinsult if the perpetrator does not know a person's pronoun and just assumes pronouns based on physical appearance or gender expression. When a trans person corrects someone who committed a microinsult, they may experience microinvalidations in the forms of defensive responses such as, "It is hard for me to use the right pronoun for you when you are dressed like that," or "She was a he back then, so I am using the correct pronoun for the time." These defensive responses further negate and nullify a trans person's identity and experience and can cause more psychological harm. Using affirming and inclusive language for trans people is one of the most crucial and culturally responsible recommendations for being in solidarity with trans rights and justice. Excuses and explanations from perpetrators who do not understand the importance of affirming and inclusive language can severely decrease physical and psychological safety for trans people.

Another common example of trans microaggressions revolves around the idea of "realness."

For example, consider the dehumanization in statements such as, “I only date real men” or “I only date real women,” which insinuates that trans men and trans women are not “real.” Realness comes up again in examples of trans microaggressions when people assume that someone has not “fully” transitioned unless they receive some type of medical intervention and is therefore not real until they do so. Prioritizing medical transition in statements such as “So when are you going to have the surgery?” or “When are you going to really transition?” not only reduces trans people to body parts but also assumes that there is only one way to be legitimately trans. Not only does this harmful stereotype warp public perception of trans people, but it can also destabilize a trans person’s sense of self if they internalize the message that they cannot claim to be trans unless they have undergone a specific type of medical intervention.

One key aspect of microinsults concerns the attempt to give someone a compliment, yet the supposed compliment actually perpetuates limited beliefs and stereotypes about trans people. Statements like, “I never would have known you were trans if you had not told me!” or “You look so good for a transgender person!” are not supportive and do not uphold the total humanity of trans people. Having one’s humanity constantly called into question can lead to gender minority stress and, if a trans person has another minoritized component of identity (e.g., racial microaggressions, sexual orientation microaggressions, religious microaggressions), then they might develop multiple minority stress.

Impact of Microaggressions

Experiencing microaggressions can ignite the stress response in the body that is associated with survival. Trans people have to quickly assess their safety in the moment, which can be difficult to do when having a trauma response. Safety is a primary concern for trans people, and a person or environment that has been deemed safe can become hostile or unsafe after one has experienced a microaggression. For instance, many trans people have historically felt welcome and safe in the broader LGBTQIA+ communities. However, people who comprise the broader LGBTQIA+ communities may mistakenly think that they are not complicit in perpetuating anti-trans prejudice and transphobia because they are also considered sexual and gender minorities. They may be unaware of how they perpetuate cisnormativity and be unsympathetic to the unique experiences associated with gender identity that are distinct from sexual orientation. The constant need to assess one’s safety and cope with micro and macro levels of anti-trans prejudice and transphobia can result in anxiety, depression, toxic shame, low self-esteem, low self-worth, increased substance use, self-harm, and suicidality.

In many cases, people who experience microaggressions do not indicate to the perpetrator that what was said or done was offensive. Several factors may inform nonresponsiveness to microaggressions, including the following: having experienced a previous trauma, which can result in not being able to access language after experiencing a microaggression; questioning the intent of the perpetrator, especially if it is a close friend or loved one; feeling too unsafe to respond to a person who is in a position of power (e.g., supervisor, medical, or behavioral health provider); and avoiding nonconsensual, unpaid emotional labor involved in educating the perpetrator after they just caused harm.

Furthermore, in addition to the microaggressions that trans people endure, they are also still grappling with macroaggressions, including but not limited to gender-separate bathrooms and public messaging that denounces and delegitimizes the existence of trans people.

Mitigating the Impact of Microaggressions

People who experience microaggressions often doubt their experiences. This can include thinking that they are being overly sensitive or doubting their perception of reality. Invalidating their own experiences can result in internalized oppression and exacerbate the already destabilizing effects of experiencing microaggressions. It is less important to distinguish between microassaults, microinsults, and microinvalidations and more important to recognize that something was offensive and harmful. Recognizing and validating experiences of

trans microaggressions can mitigate feelings of shame and guilt and potentially increase feelings of safety, self-esteem, and self-worth.

After trans people experience a microaggression, whether they share this with the perpetrator or not, the next step for decreasing the harmful effect is to validate their own experience for themselves by trusting their perception of reality. Another helpful step is seeking validation from other trusted trans people as well as other people in their network of support. Finally, putting together a physical and emotional safety plan for dealing with microaggressions can mitigate the negative impact of microaggressions and increase resilience.

Microaggressions and Trauma

Research on the impact of microaggressions has been framed not only as minority stress but specifically as traumatic stress. Traumatic stress can lead to a host of trauma responses such as avoidance, dissociation, depersonalization, hypervigilance, and more. Some mental health clinicians conceptualize clients who have traumatic stress as having posttraumatic stress disorder (PTSD), while others use the framework of complex trauma. Assumed in the clinical criteria for PTSD is that a client has a baseline of normalcy and an experience of acute trauma threatens that normalcy. PTSD clinical interventions seek to restore the client back to their pretrauma baseline. However, the prevalence of systemic and institutional oppression exposes people with marginalized identities to microaggressions on an ongoing basis, which therefore calls into question assumptions of pretrauma normalcy. Complex trauma is a framework that takes the reality of ongoing oppression into consideration. Clinical interventions assist clients in developing ways to calm and manage stress and/or trauma responses, which also helps clients cultivate a sense of internal safety. Complex trauma clinical interventions also support clients by identifying and increasing external resources, as well as implementing continual physical and emotional safety planning. Overall, the best clinical intervention model depends on the client's needs and available resources.

Migrants, Legal Issues

Trans migrants to the United States face a variety of legal issues that range from obtaining a legal status with gender-congruent identity documents to being at risk of detention and deportation. Migration studies and trans studies scholars have highlighted

how the convergence of criminal law and immigration law since the 1990s has disproportionately affected trans migrants. Trans migrants face legal and economic barriers to legal status, which makes them more vulnerable to policing and criminalization. Trans migrants who are classified as deportable by Immigration and Customs Enforcement (ICE) have been subject to violence and death in immigration detention facilities. In turn, some trans studies scholars have critiqued reformist responses to the immigration detention and deportation regime in the United States.

Migration and Identity Documents

Trans studies and migration studies scholars have demonstrated that administrative and bureaucratic systems, such as identity documentation, play a major role in the distribution of life opportunities and resources for trans people and trans migrants specifically. Consistent identity documents are needed to access housing, enroll in school, and apply for jobs. The legal and economic barriers to obtaining identity documents with a correct name and gender disproportionately affect trans migrants and have implications for increased policing and criminalization.

Trans migrants who have a legal status in the United States are able to change their identity documents, including their immigration documents, to reflect their name and gender identity. (Notably, the process for updating identity documents with one's correct name and gender marker varies across state and federal government agencies, can be prohibitively expensive, and may require proof of surgical or hormonal transition from a doctor.) Yet significantly, the options for legal migration to the United States are limited to begin with. Most immigrants either obtain an employment-based visa through their employer or are sponsored by a family member for a permanent resident card. These pathways to legal status may not be available to many trans migrants owing to gender-based job discrimination and family rejection. Other options include a spousal visa, the asylum process, or a U-visa or T-visa. Until the 2015 U.S. Supreme Court decision in *Obergefell v. Hodges,* trans marriages were not always recognized as valid if they were seen as same-sex marriages, depending on the marriage laws of the state in which individuals reside. Asylum has been a key strategy for gaining documented status for many trans migrants, but this form of discretionary relief is limited and difficult to access without legal resources or representation. Trans migrants who are not able to migrate to the United States through legal processes ultimately cross the U.S. border as undocumented immigrants. Although some states provide driver's licenses to undocumented residents, undocumented trans migrants may not be able to update their name and gender marker on those state identity documents.

Having inconsistent name and gender markers on identity documents makes trans people vulnerable to discrimination and violence and constrains access to employment and housing. While there are few empirical studies that focus specifically on LGBTQ migrants, studies such as the National Center for Transgender Equality's 2015 U.S. Transgender Survey (USTS), which surveyed over 27,000 trans adults, show that trans people in the United States experience pervasive discrimination and mistreatment in all areas of life, which lead to disparities between trans and non-trans people in relation to employment, housing, health care, and education. For trans migrants, especially undocumented migrants, these disparities are compounded by their legal status. Intersecting systems of transphobia, racism, and poverty mean that trans migrants are often forced into informal economies and criminalized forms of work to survive, such as sex work or the drug trade. This, in turn, places trans migrants at higher risk of contact with law enforcement. Trans migrants also have increased vulnerability to human trafficking, which can result in criminal convictions that lead to deportation.

Criminalization of Immigrants

Immigration law scholars have traced the increasing convergence of criminal law and immigration enforcement in the United States since the 1990s, which has intensified the policing of immigrants. The criminalization of immigration over the past few decades, combined with the vulnerability of trans people to policing and other forms of state violence, means that trans migrants are particularly affected by this convergence. For example, in 1996, the Illegal Immigration Reform and

Immigration Responsibility Act (IIRIRA) and the Antiterrorism and Effective Death Penalty Act (AEDPA) expanded definitions of crimes that led to deportation for noncitizens. IIRIRA made deportation mandatory for "aggravated felonies" (defined as criminal offenses with a sentence of 1 year or more) and for certain "crimes involving moral turpitude," including sex work. The expansion of definitions of deportable offenses includes many survival crimes that poor trans migrants engage in to secure food and housing. IIRIRA also added Delegation of Immigration Authority Section 287(g) to the Immigration and Naturalization Act; this provision allows state and local law enforcement to enter into a partnership with ICE that gives the state or local entity authority over immigration enforcement within its jurisdiction.

Post-9/11 "war on terror" discourses in the United States have linked the figure of the "illegal immigrant" to discourses on national security, which has led to further involvement of state and local authorities in immigration enforcement. ICE's Criminal Alien Program enables ICE agents to identify and arrest immigrants who are incarcerated in federal, state, and local prisons and jails. This means that once an immigrant finishes serving their criminal sentence, they are given a final order of removal and transferred into ICE custody for detention and then deportation. Similarly, the Secure Communities program allows law enforcement to run the names of people who are arrested through an FBI database and a Department of Homeland Security database, targeting undocumented immigrants. Other "war on terror" legislation like the REAL ID Act further marginalizes immigrant communities and has particular implications for trans migrants who may not have consistent names and gender markers on their identity documents.

The cumulative effect of these types of programs has been the transformation of the space of the nation into a carceral space for immigrants, in which trans migrants are particularly vulnerable. Legal studies scholars argue that these programs criminalize immigrants on the basis of race and perceived immigration status, producing the social construction of "illegality." Trans studies scholars have shown how the policing of gender in public spaces, including sex-segregated services and institutions upon which many low-income migrants and trans people of color rely, contributes to the hypervisibility of trans people and increases their contact with law enforcement. For example, trans-feminine people, especially trans women of color, are often profiled by police as sex workers due to police perception of gender nonconformity as deviance. For trans people who are noncitizens, this policing can result in detention and deportation.

Immigration Detention and Deportation

As a result of the passage of IIRIRA in 1996, the number of immigrants held in detention facilities has skyrocketed, and immigration detention is the fastest growing incarceration system in the United States (and globally). Immigration detention facilities are intended to temporarily incarcerate immigrants before they are deported, but many immigrants spend months or years in detention as they fight their removal orders. Immigration and human rights scholars argue that the increasing privatization of immigration detention facilities constructs immigrant bodies as commodities for the carceral state.

Trans migration studies scholars examined the intersections of gender violence and immigration detention as forms of racialized control that make trans migrants particularly vulnerable in detention facilities. Trans detainees are harmed by the conditions of immigration detention facilities, as well as by practices of housing classification, solitary confinement, sexual assault, and the denial of adequate medical care. As with all sex-segregated institutional spaces, the very structure of immigration detention makes it dangerous for trans migrants due to their gender (mis)classification based on external genitals. In many facilities, the initial intake and processing of detainees includes a strip search, which can take place in front of other staff and detainees and can out a detainee as trans. Feminist scholars have identified strip searches as a form of gender and sexual violence. Trans migrants are also vulnerable to sexual assault from staff because they are frequently placed in administrative segregation (solitary confinement), sometimes called "protective custody" units. Human rights advocates argue that solitary confinement is used as a method to control and punish trans detainees, as well as to pressure detainees to accept deportation even if

they have valid legal claims for staying in the United States. Building on critical ethnic studies, scholarship on trans migrants in immigration detention has emphasized the ways that the categorization of sex/gender in immigration detention is bound up with the criminalization of racialized immigrants to demarcate a population of deportable subjects. Additionally, trans migrants experience forms of medical neglect in detention facilities, including the denial of hormone therapy. Human rights organizations have documented multiple deaths of trans migrants in detention due to the deprivation of HIV/AIDS medications and other needed medical care.

National LGBTQ legal advocacy organizations like Immigration Equality, the Heartland Alliance National Justice Center, the National Center for Lesbian Rights, and the Transgender Law Center provide legal services to detained trans migrants and have pursued legal action against ICE and abuses within immigration detention centers. ICE has responded to the documentation of these forms of violence and death in immigration detention facilities by establishing new facilities that include units specifically for trans detainees. Yet as Human Rights Watch has documented in its March 2016 report, *"Do You See How Much I'm Suffering Here?": Abuse Against Transgender Women in US Immigration Detention,* special units do not insulate trans detainees from abuse and violence from prison staff or negate the reality of being indefinitely incarcerated. Trans studies scholars have drawn on critical prison studies scholarship to argue that these reformist approaches only address the problems with conditions within immigration detention facilities, rather than the actual problem of the criminalization and mandatory detention of trans migrants. Queer and trans immigrant justice organizations like El/La Para Translatinas, Familia: Trans Queer Liberation Movement, Trans Queer Pueblo, and others have also called for the abolition of immigration detention facilities in the United States.

Military/Military Ban

The U.S. Armed Forces has held a longtime ban against trans people based on policies by the U.S. Department of Defense (DoD). In 2015, under the Obama administration, the DoD began the process of updating its policies to be more inclusive of trans people in the military. In 2019, however, under the Trump administration, the ban was reinstated to prohibit most trans people from military service. Scholars and equal rights advocates described these policies as discriminatory and in opposition to recommendations from contemporary research on trans people and the military. The existing literature shows that the inclusion of trans people in the military has no negative effects on operational effectiveness, unit morale, or cohesion, and the added cost of implementing trans-related health care in the military is estimated to be

relatively low. The ability to have trans people in the military is further demonstrated by the fact that nearly 20 non-U.S. armed forces around the world include trans people among their ranks. For these reasons, the Biden administration revoked the prior administration's directive in 2021.

History of the Ban

Trans people were previously banned from all branches of the U.S. Armed Forces by DoD policies presuming that trans people had medical and psychological conditions that made them unqualified for military service. More specifically, previous medical regulations stated that anyone having undergone changes to their genitalia were ineligible to participate in the armed forces. This means that trans people with a history of gender affirmation surgery could have been excluded or discharged from the military as a result. DoD policies also cited psychological reasons for disqualifying trans people from military service. That is, anyone with an alleged trans-related mental health diagnosis (previously referred to as transsexualism) could be denied opportunities for military enlistment, and active service members could be denied retention or discharged without honor as a result. The military ban on trans people has been based on these policies for decades, although the exact origin of these procedures is unknown.

Historic legislative actions are likely to have informed DoD's approach to trans people and the military. In the case of *Doe v. Alexander* (1981), a trans individual was denied reentry to the military after having undergone gender affirmation surgery. The trans plaintiff had served in the U.S. Air Force as a man for 8 and a half years prior to seeking enlistment in the Army as a woman. She was denied entry on medical fitness grounds, assuming that variations or changes of genitalia would impair military service and thus constitute a disqualifying medical condition. In *Leyland v. Orr* (1987), a trans woman was discharged from the Air Force because of having undergone gender affirmation surgery while in the military. In this case, physical unfitness was the cited reason for discharge, again assuming that changes to genitalia would negatively affect service readiness. Finally, in *DeGroat v. Townsend* (2007), a member of the Air Force was discharged for crossdressing, as the behavior was perceived as sexual perversion and thus a disqualifying psychological condition.

It is worth noting that the repeal of "Don't Ask, Don't Tell" (DADT) in 2011 had no effect on the military's ban on trans people. Instead, while cis lesbian, gay, and bisexual individuals were then permitted to serve openly, trans people remained subjected to exclusionary DoD policies, as described above.

Changing the Ban

On July 13, 2015, U.S. Secretary of Defense Ash Carter issued a statement with two directives related to trans people and the U.S. military: (1) Service members would no longer be discharged from the military because of their gender identity, including trans people, unless determined by the Secretary of Defense for Personnel and Readiness, and (2) a working group would be created to study the policy and readiness implications for the inclusion of trans people in the U.S. Armed Forces. The working group was to be led by the Secretary of Defense for Personnel and Readiness and comprised military and civilian personnel representing all military branches and the joint chiefs of staff.

About a year later, on June 30, 2016, Secretary of Defense Ash Carter announced the end of the ban on trans people from the U.S. military. He declared that trans people in the United States could serve openly in all branches of the armed forces and could no longer be discharged or separated because of their gender identity. Shortly thereafter, on September 30, 2016, the DoD published *Transgender Service in the U.S. Military: An Implementation Handbook* that provided comprehensive guidance for trans service members, commanders, and all service members regarding the shift to trans-inclusive military policies and procedures. In the months following, military health care professionals were trained and began providing trans-related health care to active trans service members. In addition, the Air Force, Army, and Navy issued their own trans-inclusive policies on top of and consistent with the DoD policies. The final step in implementing the new policy was to begin recruiting and enlisting trans service members who demonstrated eligibility and readiness for military service. This was set to commence on July 1, 2017, thus ending the military's history of discrimination against people based on gender identity.

However, after more than 2 years of study and preparation, the implementation of trans inclusion was halted on July 26, 2017, when President Trump announced via Twitter that he planned to

reinstate the ban on trans service members. He said his decision was brought about by concerns associated with the costs of providing health care to trans service members as well as the potentially negative effect on military operations. Subsequently, on August 25, 2017, an official memorandum was released by the White House that directed the postponement of implementation of the trans-inclusive policies initiated by the DoD under the Obama administration. This meant ceasing recruitment and enlistment of trans people and terminating coverage of gender affirmation surgery by the DoD. President Trump directed the Secretary of Defense to submit a plan for reinstating the ban on trans service members by February 21, 2018.

Equal rights groups described the ban as discriminatory and inconsistent with contemporary research on trans people and the military. Multiple lawsuits were brought against the Trump administration in the ensuing months, including four federal district court cases: *Doe v. Trump, Stone v. Trump, Stockman v. Trump,* and *Karnoski v. Trump.* Lower courts issued injunctions that blocked the ban, thus allowing trans people to remain eligible to serve openly. However, on January 22, 2019, an ultimate decision came from the U.S. Supreme Court, which upheld the Trump administration's ban on trans people from serving in the military. The final phase of implementing the ban began on March 12, 2019, with the release of the memorandum, DTM-19–004, "Military Service by Transgender Persons and Persons With Gender Dysphoria." In contrast to previous prejudicial policies concerning trans people and the military, the 2019 memorandum stated that the armed forces are "open to all [qualified] persons" and that individuals cannot be denied military opportunities or discharged "solely on the basis of his or her gender identity."

At first glance, the newer directive appeared inclusive of trans people in the military. However, scholars and equal rights advocates described the policy as a reinstated ban on trans service members because it stated that anyone with a history of gender dysphoria or trans-related medical or mental health treatment (e.g., hormone therapy) would be considered ineligible for service, thus excluding the vast majority of trans people. Furthermore, the policy indicated that if a trans person renounced their gender identity and served as their birth-assigned sex, they could qualify for service. In this way, the policy was likened to DADT because it forced trans service members to conceal their gender identities to maintain ongoing eligibility. Service members were permitted to apply for policy exceptions; however, this could also have led to military separation or discharge, thus risking one's military career. Table 1, which is adapted from a chart released by the DoD on March 13, 2019, shows the differences between the 2016 and 2019 policies regarding the ability of trans people to serve in the military.

On January 25, 2021, newly-elected President Biden signed an executive order revoking the prior administration's ban on trans people in the U.S. Armed Forces. The order declared that those who wish to serve in the military are permitted to do so openly, inclusively, and without discrimination. Furthermore, he referenced a statement made in 2016 by the Secretary of Defense, who had concluded that enabling service members to transition while serving was an appropriate process.

Potential for Inclusion

Research on the impact of including trans personnel in the armed forces steadily increased following the repeal of DADT in 2011. Also, as described earlier, when the Obama administration considered lifting the ban, the DoD established a working group to study the implications of including trans people in the U.S. Armed Forces. As part of this effort, the DoD commissioned the RAND Corporation to evaluate the anticipated effects of allowing trans people to serve openly in the military. The upsurge of research has led to an improved, evidence-based understanding of trans service members and the implications of trans-inclusive military policies. In fact, President Biden cited comprehensive research when signing the 2021 Executive Order, including studies by the Palm Center, which concluded that enabling trans individuals to serve openly in the U.S. military was consistent with military readiness and has not had a significant impact on unit cohesion, healthcare costs, or operational effectiveness in foreign militaries.

The notion that all trans people are mentally ill and should be banned from the armed forces as a result has no empirical basis, as reported by researchers and mental health experts. Many health organizations have denounced the ban on these grounds, including the American Medical Association, the American Psychiatric Association, the American

Table 1 Restrictions 2016 Versus 2019

Group		*2016–2019*	*2019–2021*
Service members	Transgender with no history or diagnosis of gender dysphoria	May serve in biological sex	
	With diagnosis of gender dysphoria	May serve in keeping with gender identity upon completing transition	May serve in biological sex. If unable/unwilling to serve in biological sex, separation procedures may apply
Applicants	Transgender with no history or diagnosis of gender dysphoria	May serve in biological sex	
	With diagnosis or history of gender dysphoria	Presumptively disqualified unless stable for 18 months in keeping with gender identity or biological sex	Presumptively disqualified unless stable for 36 months and willing and able to serve in biological sex
	With history of medical transition treatment		Presumptively disqualified

Psychological Association, the American Academy of Nursing, and the American Association of Sex Educators, Counselors, and Therapists.

The health care needs of trans service members are within the scope of medical services already provided to cis military personnel, and the population's health care needs are not significantly different from those of cis people. For instance, without a ban in place, between 29 and 129 service members were expected to access transition-related health care each year by the military. Furthermore, the cost of trans inclusion to the DoD was estimated to be between $2.4 and $8.4 million per year, which is proportionally small, considering that the annual health care costs of cis military personnel is $6 billion.

Military unit cohesion and morale are not found to be negatively affected by the inclusion of trans service members. Instead, trans service members are adversely affected when the armed forces seek to exclude trans people because they are forced to hide their identity to maintain military eligibility, risk discharge if open about their gender identity, or voluntarily terminate military service, causing the military to miss out on trans service members who are otherwise eligible and who are perhaps highly trained and capable personnel.

Outside the United States, many developed countries prohibit gender identity discrimination in their armed forces and have implemented policies for the inclusion of trans personnel. As many as 19 countries permit trans people to serve openly in the armed forces through a variety of policies and procedures. Australia, Canada, Israel, and the United Kingdom have some of the most descriptive policies guiding the inclusion of trans service members. Other countries work with trans people on a case-by-case basis, similar to their recruitment and enlistment of cis service members.

Misgendering

Misgendering is the act of referring to someone as a gender different from how they identify themselves, through misusing gendered personal pronouns (such as "she," "he," or "they"), honorifics (such as "ma'am" or "sir"), and other terms of address. One example is when a cashier mistakenly addresses a trans woman customer as "sir." Other forms of misgendering include "deadnaming," or the use of a person's former name, and inappropriately attaching gendered meanings to specific bodily characteristics—for example, assuming that a person with facial hair, a low voice, or a penis is a man or that a person with breasts, short stature, or a high voice is a woman. While people sometimes maliciously misgender others, in many cases, they are unaware that they have misgendered someone. Thus, misgendering can be overtly aggressive or microaggressive.

Whether conscious or not, misgendering reflects taken-for-granted, dominant cultural ideas about gender, identities, language, and bodies—namely, that gender is biological, fixed, and binary and that gender identity can be attributed to a person based on how they look and sound. These cultural ideas also pathologize individuals who see their gendered selves differently from how others see them. As a result, misgendering invalidates and stigmatizes non-cis identities and reproduces anti-trans perspectives and sentiments.

Even if unintended, misgendering negates a person's sense of self and is typically experienced as an injury. Misgendering is thus a minority stressor—a repetitive experience of prejudice, discrimination, lack of social support, and stigma related to their minority status that causes chronic stress for members of minority groups. Many trans individuals encounter misgendering in their daily lives across various settings: at home, at work, at school, in public, and from friends, family, romantic partners, and health care providers. In addition to mainstream spaces, misgendering also occurs, albeit comparatively less frequently, in queer and trans communities. Generally, trans people feel stigmatized and psychologically distressed when misgendered, and continually experiencing this injury has a cumulative impact on their mental health. In particular, misgendering increases the incidence of depression, suicidal ideation, and suicide attempts.

Personal characteristics, such as race, outward bodily appearance, body shape, and aesthetic appearance, can contribute to misgendering in mainstream society, as well as in queer and trans community spaces. For example, some individuals

have noted that others have attended to their "curvy" shape or reportedly "nonqueer" style or "look" and have ignored their gender presentation when misperceiving their gender identities. Because of the idea that sex category is the same as gender identity, as well as related assumptions about people's voices, Black trans men are more likely than any other group to be misgendered over the phone.

Some trans people, particularly those who are agender and neutrois, do not identify as having a gender. They may not characterize others' misrepresenting their identities as misgendering because the idea of "mis"-gendering suggests that a person has a particular gender. However, they may still experience being placed into a gender category as stressful, since this negates their lack of a gender identity.

Gender affirmation, or the use of a trans person's chosen name and terms of address, is associated with lower rates of depression and suicidality. To ensure that cis people recognize and support their genders, trans people often share their pronouns and encourage others to do likewise, instead of assuming a person's gender based on their appearance. Asking pronouns prevents misgendering, and while doing so may feel uncomfortable at first, mistaking someone's gender can be even more awkward. To reduce the stress of misgendering when it happens, trans people advocate for the individual who has made the mistake to quickly correct themselves and then promptly move on, instead of making lengthy apologies.

Institutions and organizations, including health care facilities, schools, businesses, and social service agencies, can reduce misgendering-related stress by giving their employees basic information about trans populations and training them on ways to affirm and not assume gender. Workplaces are increasingly implementing these practices, and many are also developing and disseminating guides to help other institutions and organizations do so as well. To avoid misgendering, some individuals and groups are suggesting practices that avoid gendering completely. In place of "Ms." and "Mr.," some medical professionals have advocated for using gender-neutral titles for everyone, such as "Mx." or "RP," which stands for "Respected Person."

Institutions and organizations can also affirm trans people by having official records reflect an individual's gender identity and the pronouns and forms of address they use for themselves. The Human Rights Campaign (www.hrc.org) has developed LGBTQ-inclusive policy guidelines for municipal governments, health care facilities, and corporate workplaces. These benchmarks promote the adoption of trans-affirming policies, in addition to other measures that further LGBTQIA+ equity.

Mock, Janet

Janet Mock, a trans woman of color, is an author, trans rights activist, television producer, and director who has become one of the most influential trans voices and advocates in mass media. This entry discusses the details of Mock's journalism career, provides a summary of her memoirs, and describes the impact of her contributions to film and television.

Mock and the Media

Born in Honolulu, Hawai'i, on March 10, 1983, Mock relocated to New York City to pursue a graduate degree in journalism from New York University (2006) after completing her undergraduate education at the University of Hawai'i, Mānoa (2004). In New York City, Mock worked as a staff editor at *People* magazine for 5 years and lived as "stealth"—a term used within trans communities that refers to an individual's decision *not* to disclose their gender identity—until she began dating Aaron Tredwell, whom she ultimately wed. Mock rose to prominence following her decision to publicly come out as a trans woman in a 2011 article in *Marie Claire*. She subsequently became a contributing editor at the magazine, writing about race, gender, aesthetics, and the representations of minoritized people in the film, television, and global beauty industries. In 2015 and 2016, Mock hosted *So POPular!,* an online talk show on MSNBC's Shift network, where she discussed a range of cultural issues with special guests that included other trans women of color, such as Laverne Cox and Ts Madison.

Redefining Realness and *Surpassing Certainty*

Mock's groundbreaking 2014 memoir, *Redefining Realness: My Path to Womanhood, Identity, Love & So Much More,* discusses events and relationships during her childhood that significantly shaped who she became, including grappling with a fractured relationship between her mother (Hawai'ian and Portuguese) and father (African American), as well as early lessons about race/ethnicity, masculinity, body dysmorphia, and sexual abuse. Mock learned about femininity in her youth by carefully observing her grandmother and aunts while secretly maintaining an alter ego named Keisha, who enabled Mock to freely express her femininity without her family's knowledge or chastisements. At age 15, Mock came out to her family as transgender; her mother readily accepted her, but her father initially struggled with denial and failed to understand Mock's identity before asserting his unconditional love for his child.

While Mock's family accepted her identity, they continued to struggle with other issues, including addiction and homelessness, which prompted Mock's early pursuit of financial independence. Mock quickly realized that, as a trans woman, her ability to navigate the world while evading transphobic and racist violence depended heavily on her ability to embody "realness"—a concept that she describes as "the ability to be seen as heteronormative, to assimilate, to be not read as other or deviate from the norm" (Mock, 2014, pp. 115–116). Mock is not the first person to articulate a theory of "realness"; rather, the term and concept emanate from the underground ballroom scene. However, Mock's definition of "realness" is reflective of scholarship about the ballroom community, many of whose members are trans women of color.

Mock's second memoir, *Surpassing Certainty: What My Twenties Taught Me,* chronicles the numerous life lessons she learned during young adulthood. The book begins with Mock's trying to balance being a first-generation college student with working as a dancer at a strip club to support herself financially. Because of this experience, she refuses to pathologize sex work but, at the same time, recognizes how a lack of educational and employment opportunities for trans women of color often results in their using their bodies to acquire the material resources needed to survive. At the strip club, she meets a naval yeoman who becomes the first person with whom she falls in love, which forces her to grapple with the complexities around intimacy, dating, sex, and disclosure for a trans woman. Desiring to allow her true self to be visible, Mock spends her 20s navigating these issues, in addition to moving away from home to pursue a professional career in media in New York City. She quickly becomes a well-respected media voice, despite the institutional barriers that frequently impede trans people, women, and people of color—especially individuals who are all three.

Honors and Influence

Mock's presence and influence in popular culture in support of trans rights has been widely recognized. It was following her career as a journalist and the publication of *Redefining Realness* that she rose to prominence, but her advocacy work began long before then as a board member of the Arcus Foundation, an organization that provides

grants to further LGBTQ+ rights. She has been the recipient of numerous honors and awards, including the 2012 Sylvia Rivera Activist Award (from the Sylvia Rivera Law Project), the 2014 Inspiration Award (GLSEN), the 2014 Maggie Award for Media Excellence (Planned Parenthood), a 2015 Stonewall Book Award in Non-Fiction (American Library Association), the 2020 Stephen F. Kolzak Award (GLAAD), and the inaugural José Esteban Muñoz Award (CLAGS: The Center for LGBTQ Studies). Mock has also made lists of highly influential LGBTQ+ people. She was named one of *Out* magazine's "Out 100" in 2013 and one of *The Advocate* magazine's "40 Under 40" in 2014.

Mock's storytelling acumen is highly sought after, and in 2018, she was hired to serve as a writer, director, and producer for Ryan Murphy's hit FX Series *Pose,* a musical drama that chronicles the lives of Black and Latinx gay, bisexual, queer, and trans members of New York City's ballroom scene in the early 1990s. Mock became the first out trans woman of color to serve as a writer on a television series and to direct a television series episode. In 2019, she signed a 3-year deal with Netflix to produce a television series and possibly a feature film, making her the first trans woman of color to partner with a major television/streaming company.

Morris, Jan

Born on October 2, 1926, in Clevedon, England, Jan Morris was a historian, journalist, and writer. A trans woman, Morris published under her birth name, James Morris, until 1972, when she transitioned from male to female. After a lengthy career working as a journalist, Morris established a reputation as a travel writer with her vivid portraits of cities and achieved acclaim for writing extensive histories of the British Empire. In 1974, Morris published *Conundrum,* one of the first best-selling autobiographies by a trans person, in which she describes her journey from feeling that she was female from her earliest memories to having gender-affirming surgery in the 1970s. The powerful and beautifully written memoir inspired countless trans people and gave visibility to the trans community at a time when few trans people were out and anti-trans prejudice was widespread.

At the age of 17, Morris joined the British Army and served with the 9th Queen's Royal Lancers during the latter part of World War II. She served as an intelligence officer in Venice, Palestine, and Trieste, which led her to become fascinated with cities. After her time in the army, Morris returned home and, in 1949, attended Christ Church, Oxford, to study English. Upon graduating, she became a reporter for *The London Times* and later for the *Manchester Guardian*, beginning a distinguished career in writing. Extraordinarily, Morris was the reporter who covered the British Mount Everest expedition led by Tenzing Norgay and Edmund Hillary, the first known successful ascent of the world's highest mountain, which occurred on May 29, 1953. Morris, the only journalist on the expedition, sent word of their accomplishment to London for release, with its publication happening to coincide with Queen Elizabeth II's coronation on June 2, 1953. The day that welcomed the second Elizabethan era also saw the beginning of Morris's career as a travel writer.

Morris started writing travel books in the late 1950s, beginning with *Coast to Coast* (1956)—published in the United States as *As I Saw the U.S.A.*—which detailed her travels across the country in the 1950s. Her book *Venice* (1960), a sweeping cultural history of Venice, Italy, which recalled her time there while serving in the British Army, became a best-seller and built her literary reputation as a travel writer. She wrote additional books about Venetian society and works about her experiences in other places, including New York City, Spain, Sydney, and Hong Kong. Morris wrote more than 40 books and numerous articles and essays and received many awards for her

literary contributions, including the Heinemann Award, the Glyndŵr Award for Outstanding Contribution to the Arts in Wales, and the Golden PEN Award for a "Lifetime's Distinguished Service to Literature." In 1999, she was recognized with the Most Excellent Order of the British Empire.

Morris gained notability as a historian for *The Pax Britannica Trilogy,* an extensive history of the British Empire, whose volumes were published in 1968, 1973, and 1978. Instead of being based on concrete historical events, *Pax Britannica* focused on the effects of empire from different perspectives. Morris's last two books before her death in November 2020, *In My Mind's Eye* (2019) and *Thinking Again* (2020), consisted of daily diary entries in which she commented on contemporary events, such as the #MeToo movement and Brexit, and aspects of her life, including being old and her love for the natural world.

Morris married Elizabeth Tuckniss, with whom she raised four children (a fifth died in infancy), in 1949. The two remained together when Morris began to medically transition in 1964, but they were forced to divorce when Morris was legally recognized as a woman in 1972 because of Britain's then ban on same-sex marriage. The two continued to live together and reunited in a civil union in 2008, when they could legally do so. Morris discussed her relationship with Tuckniss in her memoir about being trans, *Conundrum* (1974). At the time, there were few narratives of married trans women who had been able to maintain their relationships after they had transitioned, so the work provided a tremendous boost to trans women and their partners.

Conundrum, her first book to be published under her new name, was also significant for offering an honest, heartfelt account of feeling that she was "born into the wrong body" and the struggles she faced to be true to herself. At the same time, she did not shy away from describing her anxieties and apprehensions about have gender-affirming surgery in Casablanca, Morocco, in 1972, or the adjustments she had to make in living as a woman. For cis readers, the book gave insights into the experiences of being trans that were not available in any other media at the time; for trans readers, it enabled them to better understand themselves, offered information on the nature of gender-affirming surgeries, and provided hope that they too could lead happy, healthy lives.

Morris was the first internationally known person to then come out as trans, as opposed to other trans individuals, like Christine Jorgensen and Renée Richards, who became famous after their transitioning became public. As such, she was a trailblazer and a role model for many other trans people, especially trans women (one of those who cites Morris's importance to them is writer Jennifer Finney Boylan). Morris's very public transition in the 1970s not only allowed her to live an authentic life but also gave a sense of discernibility to the trans community, especially during a time when trans people, and LGBTQIA+ people more generally, were subject to persecution and discrimination for embracing their identities. In *Conundrum,* Morris used her talents for imagery and description, as she had exhibited in her vivid travel writing, to shed a brighter light on trans experiences than previous trans autobiographers and to offer new perspectives on the relationship between gender and misogyny, which remains a critical topic of discussion in trans studies today.

Murray, Pauli

Pauli Murray (1910–1985) was an African American feminist, gender-nonconforming civil rights activist, lawyer, educator, author, and priest who was active for over 50 years in struggles for racial, gender, and economic justice. Although

she never openly identified as any nonnormative gender or sexuality, Murray expressed a masculine gender throughout her life. In her early 30s, she tried unsuccessfully to participate in experiments with the masculinizing hormone testosterone. Murray's legacy is defined by both her gender nonnormativity and also her activist leadership, such as confronting racial segregation on public transit and in education, challenging racism within the women's movement, crafting feminist-of-color analyses within American law, and pushing the Christian church to address its institutional sexism. Specifically, Murray helped pioneer tactics of nonviolent resistance that would later be widely adopted by the civil rights movement. She introduced "Jane Crow," the first legal formulation of the intersection of sexism and racism; later in life, she cofounded the National Organization for Women (NOW). She was also the first African American woman to be ordained as an Episcopalian priest.

Early Life

Murray was born in Baltimore, Maryland, the descendant of an enslaved woman and her owner, and a freeman and freewoman. When Murray was 4, her mother died. She was sent to live with maternal aunts in Durham, North Carolina, who supported Murray's free spirit and unconventional desires, including her wish to wear boys' clothing and use male nicknames like "Paul" and "Lenie." Murray excelled in high school but bristled at the constraints of racial segregation. Instead of continuing her studies within segregated institutions, Murray joined the tens of thousands of African Americans then migrating to northern cities, searching for the personal and political autonomy unavailable to them in the South.

Art, Activism, and Gender Expression

In 1928, Murray enrolled in Hunter College, a public women's college in Brooklyn, New York. There she encountered the Harlem Renaissance movement, part of a larger cultural shift that encouraged a more radical approach to confronting white supremacy, especially in terms of racial representation. Murray put her own twist on this "New Negro" trope, changing her name to the androgynous "Pauli" when she published her first short story, a largely autobiographical 1934 account of her train-hopping adventures. She included a picture of "Pete," the protagonist, with the submission—a smiling photograph of herself.

Living at the all-black YWCA in Harlem in the early 1930s, Murray became part of a new generation of activists promoting direct opposition to political oppression and racist violence. Murray supported striking autoworkers, recruited subscribers for the Urban League, and in 1938 attempted to singlehandedly desegregate the graduate school at the University of North Carolina. She also joined the Fellowship of Reconciliation (FOR) and began to formulate how the organization's pacifist ideas could be applied in the fight against racial segregation.

Search for Medical Treatment

Murray did not last long at any single organization or campaign, as she was repeatedly hospitalized for intolerable feelings of distress surrounding her masculinity and unsustainable romantic relationships with women. Murray felt pulled toward a male sense of self, and the tension she felt between her female sex, her masculine gender, and her attraction to feminine women was often too much to bear. Murray was hospitalized several times in the late 1930s, exhausted from work and the persistent feeling there was something in her physiology that was causing her to feel male. In 1939, New York's largest Black newspaper published information regarding medical experiments with testosterone, which was being tested as a masculinizing "cure" for feminine men. Suspecting that testosterone could ease her conflicted feelings by erasing her feminine attributes, Murray visited the New York clinic where such trials were carried out, but endocrinologists denied her repeated requests.

Challenging Segregation and "Jane Crow"

In the spring of 1940, Murray took her likely romantic partner Adelene McBean to visit her family in North Carolina. Although they had been discussing with others at FOR how to use Mohandas K. (Mahatma) Gandhi's nonviolent techniques in the fight against racial segregation,

they had no intention of applying them on the trip. But when the pair was ordered to the back of the bus, Murray challenged the driver's application of the segregation law. They were arrested, which was all the more dangerous since Murray was dressed as a man at the time. Although she was incarcerated alongside McBean in a women's jail, the initial newspaper report features a man and a woman, not two women.

Represented at trial by a team from the local NAACP office, Murray became inspired to study law and enrolled as one of only two female students in her class at Howard Law School. Her experiences growing up in the segregated South, coupled with the sexism she experienced from professors and colleagues at Howard, led her to develop "Jane Crow," an analysis that addressed the simultaneous effects of legal race-based *and* gender-based exclusion.

Through the 1950s, Murray struggled to find work as a lawyer; the climate of McCarthyism stifled progressive activism, especially for those suspected of being homosexual or gender nonconforming. In 1962, Murray was invited by Eleanor Roosevelt to sit on the President's Commission on the Status of Women. In 1966, she was a cofounding member of the National Organization for Women (NOW), which she hoped would become the legal arm of the women's liberation movement. Instead, Murray left soon after its inception, citing the members' refusal to fully address race and class issues within their advocacy. In 1968, Murray accepted a position teaching law at Brandeis University and worked with the American Civil Liberties Union (ACLU) on cases advancing women's rights.

Turn Toward the Ministry

In 1973, grieving the death of her life partner, she turned to her Episcopalian faith, leaving teaching and the law to enter a theological seminary. At the seminary, Murray extended her activism in a new direction. Fusing philosophies from Black liberation theology, largely written by men, and women's liberation theology, largely written by white women, she argued that those living squarely at the intersections of race and gender held special insights into the path for all human liberation. In 1977, Murray became the first African American woman ordained as an Episcopal priest. She died in 1985, in Pittsburgh, of pancreatic cancer.

Museums

The ways in which gender diversity is represented in museums can affect how gender-diverse people are perceived in the larger society. Thus, it is critical that museums not only include trans materials but also provide fair and accurate representations of these works. To appropriately engage in transology, or the study of trans people, museums must involve trans individuals and communities directly in interpreting the gender-diverse narratives in their historical collections. In the 21st century, trans people themselves have founded trans-focused archives and collections. Among the most noteworthy are the Digital Transgender Archive in the United States, the Museum of Transology at the Bishopsgate Institute in London, and the Transgender Archives at the University of Victoria in Victoria, British Columbia, Canada.

The Necessity of Trans Representation in Museums

The ways in which museums reference and interpret evidence of gender nonconformity within the lives

of the people included in their collections affect how visitors and the museums' local communities consider and understand the subjects on display, as well as trans people and their struggle for human rights more generally. On the positive side, museums can provide a space for accurate information about gender diversity to reach the public. The inclusion of trans people in museums can

- better inform cis visitors about trans lives and counterbalance media spectacularizing and the widespread dissemination of misinformation,
- disprove the myth that trans identities are detrimental to societies and a modern phenomenon by demonstrating that gender nonconformity has existed and been depicted throughout history, and
- increase the well-being of trans people and their allies, including family members, by acknowledging that they are worthy of visibility and respect and have contributed meaningfully to history.

On the negative side, museums become active agents of social exclusion when they marginalize or erase the history of gender diversity. Museological exclusion reinforces the "othering" of gender-diverse people in the broader society. In essence, the invisibility of trans lives in museums infers that they have no meaningful place in the historical development of ancient or modern societies, rendering them historically homeless.

Historical Mechanisms for Locating Gender-Diverse Lives in the Past

Historically, when trans people have appeared in museums and archives, there are typically three mechanisms by which their gender diversity has been disclosed. First, they appear in medical reports, where they are pathologized as extraordinary or unnatural. These can include postmortem medical records that feature illustrations of genitalia, as can be found in the archival records of the French diplomat and spy Chevalier d'Éon (1728–1810) in the British Museum. Second, trans people appear in titillating media coverage, which uses the tabloid journalistic mechanism of the "shock of the reveal." For example, an article about the late English stage actor Eliza Edwards published in the *Sussex Advertiser* on January 28, 1833, under the title "Extraordinary Investigation" reported that when her body was autopsied, it was discovered, to "the surprise of everyone, [the] deceased was a *perfect man*" (emphasis added). Finally, as is frequently the case with locating evidence of gay men in the past, trans people can appear as criminals in legal records. For example, "Colonel" Victor Barker, an activist in a British fascist organization in the 1920s, was revealed to have been assigned female at birth when he was arrested for failing to appear in court as part of bankruptcy proceedings.

The museological interpretation of art history has typically used a narrative of fascination and abhorrence in considering gender diversity. For example, in describing a 2nd-century B.C.E. Roman copy of the Greek marble statue *Sleeping Hermaphroditus,* the website of Paris's Musée de Louvre remarked on the "crudest realism" of the work and stated that it remains "a source of fascination today" that thrills with its "surprise effects." This emotive account can be juxtaposed with the description of a small, inexpensive pin badge belonging to the Museum of Transology's collection, which has the simple message "LGBTI intersex inclusive" printed on it. In a tag tied to the pin, the person who donated it proclaims, "Sex and gender are very binary. It should not be acceptable! It ruins lives!" As is evident from these two contrasting examples, mainstream cultural institutions have traditionally produced knowledge about trans lives without the input of their subjects, and this has inevitably led to analyses that rely on speculation and spectacularization.

Transology

The practice of displaying trans lives in museums today needs to be distanced from what trans historian Susan Stryker terms the study of trans people as a phenomenon and instead situated within the field of trans studies. In the context of museum work, transology involves a collaborative and participatory process of exhibition making in which the lived experiences of trans and intersex people serve as a form of curatorial expertise that informs the representation of gender-diverse lives, practices, and cultures in the past and present. Engaging with marginalized communities in the (re)interpretation of their histories is central to larger efforts

to decolonize the museum. Along with being methodologically embedded in the processes of decolonizing gender from oppressive binary colonial traditions, transology contributes to decolonizing the museum by broadening the inclusion of trans and intersex people beyond Western society. As a curatorial practice, transology supersedes the examination of trans lives through the lens of unnatural abhorrence or fictitious parable, displacing it with trans people's actual voices, perspectives, and lived experience. By de-spectacularizing the interpretation of trans lives, transology can help develop a more sensitive and nuanced understanding of what it means to be a trans or intersex person today and counter the misunderstanding of trans people's lives in the broader society.

Trans-Founded Museums and Archival Collections

Perhaps the greatest progress that has been achieved to date in addressing the absence or misinterpretation of trans lives within museums and archives has been achieved by trans people themselves. The following three examples demonstrate different ways of accessing trans collections: via digital connectivity, material culture, and archival documentation.

Digital Transgender Archive

The Digital Transgender Archive (DTA) is an online hub that draws together content relating to trans history and culture from over a thousand locations internationally, with a focus on materials created prior to the 21st century. It was founded by K. J. Rawson and Nick Matte, who were motivated by the recognition that they shared experiences of finding systemic challenges pertaining to researching trans history, including widely varied terminology and grassroots collections that were inaccessible owing to the absence of a standardized cataloguing system. The DTA provides centralized digital search access to archives with historical trans materials, including primary sources that have been digitized by universities, public libraries, nonprofit organizations, and some private collections. The DTA also digitizes materials itself, which has been a tremendous help to many community organizations and publications, which otherwise would not have the ability to make their records available online. Furthermore, the DTA enables researchers to search using general, modern terms such as *transgender* to find records more easily, with more specific searches using historical or localized terms then feasible to narrow down the number of items. Ultimately, by having the collections of more than 60 archives in one place, the DTA allows global users to search a wide range of primary source material that would otherwise be less accessible and require a tremendous amount of time.

The Museum of Transology

The Museum of Transology (MoT) was founded in 2014 by E-J Scott and is a growing physical collection of more than 280 everyday objects, 155 brown cardboard swing tags, and 213 digital files (including film, photography, and music) donated by trans and intersex people. The collection has been displayed as an exhibition at multiple museums and galleries in the United Kingdom, including the Brighton Museum and Art Gallery (2017–2019) and the Fashion Space Gallery at the London College of Fashion (2017). The collection is as materially diverse as the trans experiences it reflects, ranging from objects used for gender confirmation (such as medical hormones and other artifacts used to reshape the body), items of dress (including fashions, uniforms, underwear, and accessories), makeup, and other beauty ephemera to children's toys, objects for self-harm and self-protection, religious headgear, and human remains. The MoT remains open to donations and continues to expand. The rapid growth of the collection demonstrates that, despite not seeing themselves represented in permanent museum displays, many trans and intersex people have been preserving their own "transcestry" (historical evidence of their personal gender-nonconforming trajectory), as they recognize the importance of saving material that documents trans lives. Many objects mark gender milestones, such as a first lipstick, first vial of testosterone, and a first schoolboy necktie.

The majority of the artifacts have a handwritten message affixed to them that explains the significance of the object to the donor's gender identity (the object is labeled Part A and the tag labeled Part B, implying that each is incomplete without the other). By attaching the donor's handwritten note to the object itself, emotional

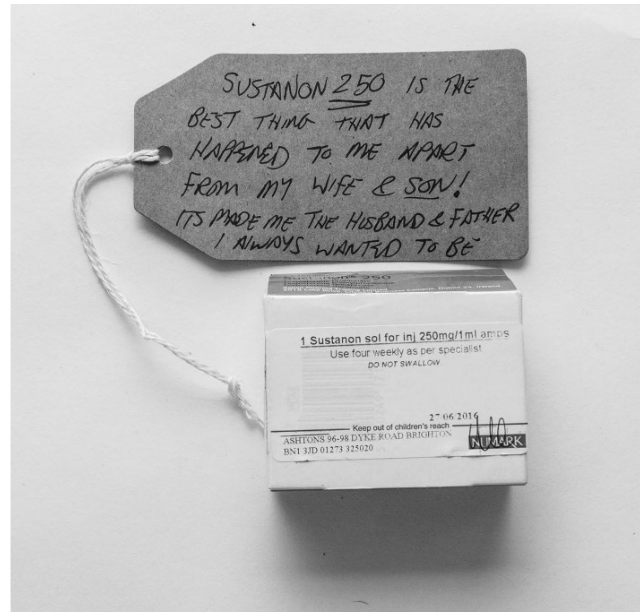
Source: Photography by Katy Davies, Fashion Space Gallery, London College of Fashion.

Figure 2 "Sustanon 250," Museum of Transology, Fashion Space Gallery, London College of Fashion, 2017.



Source: Photography by Katy Davies, Fashion Space Gallery, London College of Fashion.

resonance is also attached to the artifact. As such, the objects give voice to trans people. Several artifacts speak of the process of becoming true to one's gendered self. For example, a box of testosterone declares, "SUSTANON 250 IS THE BEST THING THAT HAS HAPPENED TO ME APART FROM MY WIFE & SON! ITS MADE ME THE HUSBAND AND FATHER I ALWAYS WANTED TO BE." These powerful and positive personal accounts displace the traditional narrative of trans tragedy that is typically perpetuated by museums, when they have included trans and intersex lives at all.

The Transgender Archives

Founded by Aaron Devor in 2007, the Transgender Archives at the University of Victoria in Victoria, British Columbia, is the world's largest trans archives, with material spanning 120 years. Recognizing that trans history should be accessible to all, the archives are open to everyone, free of charge. The focus of the archives also reflects its commitment to community, as it centers on preserving the history of trans community leaders and members and the work of allies, thereby documenting historical accounts of trans agency and resilience. This emphasis on chronicling the achievements rather than the oppression of trans people reflects the approach of Devor, who is both an archivist and an activist.

The Importance of Archives by and About Trans People

Trans people are typically examined as sites of fascination in museums and archives, frequently through a lens of incredulity and/or abhorrence. This bias is directly linked to the types of records that museums have traditionally drawn upon to explore gender diversity: nonconsensual medical documents, sensational media accounts, and criminal reports. This interpretation resonates beyond the museum, misinforming the broader society's understanding of trans people's lives today. In contrast, collections founded by trans historians that feature accounts of gender diversity through lived experience disrupt the sensationalist narratives surrounding trans lives that are typically made visible in museum exhibitions. These collections ensure that, in the future, trans lives will be discoverable in history using sources generated by the people they represent. By using the social agency of museums to affect positive social change, trans archives like the Digital Transgender Archive, the Museum of Transology, and the Transgender

Archives help to foster a better understanding of the experiences of gender-nonconforming people, both past and present.

Musicians

Throughout history, people of all cultures and all genders have created music. Whether by singing, playing instruments, or writing music, trans musical artists have affected the world. Although it can be difficult to label musicians from the distant past, the early and mid-20th century has many examples of influential musicians who are known to have been trans. The discussion of musicians included in this entry is not meant to be exhaustive, but it represents some notable 20th- and 21st-century trans musicians who have made or are making a difference in many genres of music. In addition to highlighting influential musical artists, it is important to recognize the significance of voice and singing to musicians. Although every person has a unique path as a singer, some broad aspects of the vocal transition process, including the effects of hormones on the voice, will be discussed in the second part of this entry.

Information about historical trans musicians can be difficult or impossible to find because many of these musicians, such as Billy Tipton and Wilmer Broadnax, were not out during their lifetimes. Billy Tipton (1914–1989) was a renowned American jazz pianist and bandmaster who recorded several influential jazz albums in the 1950s and 1960s. He began playing jazz in high school, and throughout his career, he performed widely in the Southwest and the Pacific Northwest of the United States. The fact that he was a trans man was unknown even to Tipton's closest friends and family, including his sons, until after his death. Wilmer Broadnax (1916–1992) was a notable American gospel quartet singer who toured and recorded many albums from the 1940s through the 1980s. He was a member of several high-profile gospel groups throughout his career, including the Spirit of Memphis Quartet. Only his closest family members knew that he was a trans man until after his death.

Other historical trans musicians, such as Christine Jorgensen, Coccinelle, Romy Haag, and Sylvester, were influential artists whose transness added to their fame and sensation. Jorgensen (1926–1989) was an American actor and cabaret singer. The fact that she was the first person from the United States to become widely known for having medically transitioned greatly contributed to her celebrity, and she appeared on television and radio programs and recorded several songs. In addition to her success as an artist and entertainer, Jorgensen was an activist and received several posthumous awards, which included being named to the National LGBTQ Wall of Honor at the Stonewall National Monument. Coccinelle (1931–2006) was a French cabaret singer, actor, and entertainer. She was open about having had gender-affirming surgery in 1958 and became an international media sensation. In 1960, after she legally changed her name and was rebaptized, she was married in the Roman Catholic Church, setting a

precedent for trans marriage rights in France. She recorded many songs in her lifetime, and her 2004 album is widely available online. In addition to her success as a singer, she was an influential trans activist. Romy Haag (b. 1948) is a Dutch singer, dancer, and actor who has performed internationally and who owned the famous Berlin nightclub Chez Romy Haag. In the 1970s and 1980s, the club was a hotspot for famous artists as well as for the Berlin LGBTQIA+ community. In addition to recording many albums and starring in several films, she was the recipient of the Teddy Award, an international award for LGBT films, in 1997. Sylvester (1947–1988) was a gender-nonconforming American singer-songwriter, composer, and record producer who was active in the disco, R&B, and soul genres. Sylvester was immensely successful as a musical artist and Black queer icon, and he was awarded San Francisco's Key to the City.

Several other musical artists have been remarkably successful in their respective genres, despite facing anti-trans prejudice. Wendy Carlos (b. 1939) is an American composer and instrumentalist, primarily active in the classical/avant-garde and film music genres. She composed the film scores for *A Clockwork Orange, The Shining,* and the original, 1982 version of *Tron.* She has won three Grammy awards for her compositions. Jayne County (b. 1947) is an actor, singer, composer, and multi-instrumentalist primarily active in the punk and punk-rock genres. She collaborated with influential artists and musicians such as Andy Warhol, David Bowie, and the Police and was the first openly trans singer in the rock music genre. Jayne County is also an activist and took part in the historic Stonewall Riots. Dana International (b. 1969) is an Israeli singer-songwriter who is active in the dance and pop genres. She has had several gold albums in Israel, as well as multiple successful Eurovision records. She performs regularly at Pride events and continues to produce new music.

Some trans artists have been the central figures in their genres. Katey Red (b. 1983) and Big Freedia (b. 1978) have both been instrumental in the New Orleans bounce music style of hip hop. Red was one of the first trans bounce music rappers and is credited with developing the sissy bounce genre. Big Freedia, who began her career as a backup singer and dancer in Red's shows, has popularized bounce music outside of New Orleans, such as by performing at the South by Southwest (SXSW) music, film, and tech festival and on several national television shows. Her voice was sampled in a Beyoncé single, and Big Freedia performed with Beyoncé during her Formation Tour.

Singing Voice

A musician's voice is integral to their identity. Even idiomatically, the expression "finding one's voice" is powerful and related to inner strength and personal identity. Studies have shown that even when a person's physical appearance is aligned with their gender identity, if their voice does not align with their gender identity, other people may not perceive them accurately. Many factors are involved in voice aligning with gender, including pitch, breathiness, resonance, and vocal variability regarding pitch, loudness, duration, and intonation contours. The following is a brief description of the mechanics of aligning singing voice and gender identity.

Transmasculine Voice

To induce vocal masculinization, AFAB (assigned female at birth) men undergo androgen therapy. Androgens are "male" sex hormones, most important testosterone, and these hormones effectively reduce estrogen levels as well as increase masculinization. Testosterone therapy in AFAB individuals often results in many physical changes, including the deepening of vocal pitch.

During cis male puberty, testosterone initially creates edema (swelling) of the vocal folds. Then, because of the accumulated collagen, the vocal folds begin to thicken and elongate, and the new structure of the folds becomes permanent. This new structure is what gives the voice its masculine quality and lower fundamental frequency. The primary difference between the vocal evolution in cis men and trans men is that the cartilage in the larynx grows significantly only during puberty. In a transitioning male individual, the vocal folds can thicken, but they cannot become longer, because the cartilage cannot grow to accommodate extra length.

The lowering of vocal pitch typically occurs in the first 6 to 12 months after beginning testosterone therapy; however, it may take up to 2 years to have its full effect. Some individuals begin to notice changes around 3 months after beginning testosterone

therapy, while a small percentage of trans men never experience a lowering of fundamental pitch. The first 3 to 12 months usually involve a considerable amount of vocal instability and unpredictability. Trans men singers often retain some of their high vocal range, although there is typically some reduction in the upper range. Because every voice is different, there is no precise amount that every person will lose from the top of their range, in the same way that there is no exact amount that each person will gain at the bottom of their range.

Hormone replacement therapy generally affects softer tissues such as muscle, fat, and skin. This can be seen in individuals whose body mass changes dramatically but whose height remains the same. Because of this principle, the vocal folds will increase in mass, but the neck, throat, trachea, and larynx will remain the same size in AFAB individuals, even after hormone replacement therapy. This creates a unique vocal timbre because, although the vocal folds have increased in mass, the vocal tract has remained the same size as it was before transitioning.

Transfeminine Voice

For the many AMAB (assigned male at birth) women who experienced puberty (including laryngeal growth) before transitioning, hormones cannot raise the fundamental vocal pitch. The most common option for raising vocal pitch in trans women is through speech therapy and in singing with vocal exercises. Although the physical composition of the vocal folds and vocal tract will not change, individuals can train the vocal mechanism in order to align their vocal quality and pitch level with their chosen presentation.

A characteristic that is generally associated with a feminine speech quality is increased fundamental pitch, which should be at least 180 Hertz (Hz). Some studies have indicated that pitch can be perceived as feminine with frequencies as low as 155 to 165 Hz, and other studies have suggested the frequency needs to be around 238 Hz to be unanimously perceived as female. The consensus among studies, however, is that 180 Hz is an appropriate goal for a fundamental frequency that will be perceived as feminine. Other vocal characteristics that are significant to a voice being perceived as feminine are increased breathiness; increased vocal variability in regard to pitch, volume, duration, and intonation contours; and an increase of the second formant. This formant increase is typically achieved by using a more forward tongue position and a more horizontal mouth shape.

The increase of vocal pitch through speech therapy can be incredibly effective, but because this is achieved through conscious manipulation of the vocal mechanism, singers should be aware that substantial treatment of pitch might lead to hyperfunctional laryngeal use and voice fatigue. An alternative approach that some laryngologists prefer is to administer laryngeal surgery to permanently raise the fundamental pitch. However, the consensus among researchers is that vocal quality tends to diminish with pitch-raising surgery.

Nonbinary Voice

Genderqueer, gender-fluid, agender, and other nonbinary singers do not fit into a single category or mold. Many of these singers have not medically transitioned, but some pursue physical changes through hormone therapy and other medical treatments. If the singer is taking testosterone in order to experience a lower voice, the vocal progression may be similar to someone with a transmasculine voice. If the singer is using estrogen and speech therapy/vocal exercises to achieve femininity, the process may be similar to that of someone with a transfeminine voice.

Muslim People

Through most of Islamic history, Muslims have faced familial, social, and sometimes legal pressure to adhere to the norms of the sexes they were assigned at birth. Deviating from these norms could mean conflict, ostracism, and other penalties—often in the name of religion. Although it is problematic to apply contemporary Western labels and ideas of gender to those who lived in the past or in non-Western cultures, the challenges gender-nonconforming Muslims have faced relate to compliance with gendered expectations, regardless of the labels they claimed. Precolonial Islamic cultures sometimes fostered greater freedom of sexual behavior and gender expression, but repression and erasure of gender variance have been common in postcolonial times in Muslim-majority nations, just as it has in the West. In the late 20th and early 21st centuries, however, trans Muslims experienced unprecedented visibility and opportunities to live authentically.

Diversity of Muslim Identity

Soon after the first Muslim community was established in the Arabian Peninsula in the 7th century C.E., Islam spread to Africa, central and east Asia, the Balkans, and the Iberian Peninsula. Subsequent trade and migration brought Muslims to virtually every corner of the globe, including North America. Colonialism also brought European—and, later, American—ideas to Muslim-majority territories, affecting their laws and cultures.

In 2017, 3.45 million U.S. residents identified as Muslim. Some U.S. Muslims are immigrants or the children of immigrants. Nearly a quarter are converts (often called "reverts"). Some descend from enslaved Africans, 30% of whom were Muslim, and have reclaimed their ancestors' faith.

This ethnic and racial range results in a richly varied trans Muslim population. For those who are devout or converts, Muslim identity may be primarily rooted in religion. For those who are not religious, the relationship to Islam may be primarily cultural—and may even coexist with rejection of Islam as a religion.

These differences lead trans individuals to place varying importance on Muslim doctrine. However, even those who are not religious are affected by the beliefs and practices of observant Muslims, including family members, peers, community religious leaders, and, in Muslim-majority nations, legal authorities.

Gender in Muslim Culture

Pervasive gender segregation is common in many Muslim communities and complicates trans Muslim lives. In the majority of Sunni and Shia mosques, as well as minority sects like Mahdavis, there are designated men's and women's prayer spaces, entrances, and social areas. This strict gender separation may be relaxed in some communities in the United States and among some minority sects, such as Ismailis, but it continues to be a common feature of Muslim life.

When gender determines one's literal place in society, defying gendered expectations is especially risky. Trans Muslims who identify as nonbinary—or look gender ambiguous—are repeatedly faced with social and religious situations that mirror the public bathroom dilemma faced by so many trans people. The limited mainstream theological support for trans Muslims has only reinforced this strict binary.

Through the Religious Lens

Although religious doctrine and congregational life are not the only—or even the primary—influences in the lives of all trans Muslims, religion provides a common backdrop.

Historical Sources

The Qur'an and *ahadith* (singular: *hadith*), which report the Prophet Muhammad's words and actions, do not explicitly address gender identity. However, the ahadith provide insight into Muhammad's views on gender diversity. Muhammad knew and accepted people known as

mukhannathun (singular: *mukhannath*), including one who was a frequent visitor to his household. *Mukhannathun* is sometimes translated as "eunuchs," but ahadith indicate Muhammad knew both mukhannathun and eunuchs and recognized them as distinct categories. The term *mukhannath* itself is believed to be a reference to feminine traits exhibited by people assigned male at birth, not anatomical characteristics like having been castrated.

In Surah 24, Verse 31, the Qur'an is believed to refer to mukhannathun in a list of males before whom women may be less modest. The implication is that mukhannathun were not like other males and were not attracted to women.

Recent Rulings on Gender Transition

The first known ruling by an established Muslim authority in support of trans Muslims came in 1987 from a surprising source: the Ayatollah Ruhollah Khomeini, the Supreme Leader of Iran and the religious leader (*marja'*) of the largest branch of Shia Islam. When Maryam Khatoon Molkara, a trans woman, presented her case, Khomeini issued a *fatwa* (religious ruling) supporting her physical and legal transition.

A year later, the transition of Sally Mursi, a trans woman in Cairo, resulted in a fatwa issued by the Grand Mufti of Egypt, Muhammad Sayyid Tantawy, a Sunni Muslim cleric. Tantawy's fatwa stated that gender change surgery was not only permissible but also obligatory.

A number of independent contemporary Muslim scholars, such as Scott Siraj Al-Haqq Kugle, who authored *Homosexuality in Islam,* have affirmed that trans Muslims have the right to transition and live full lives in the gender with which they identify.

Problems With the Rulings

The impact of Tantawy's ruling is limited by the nonhierarchical and sometimes informal nature of Sunni religious leadership. As Grand Mufti of Egypt, Tantawy's position carried a great deal of authority, but it did not extend beyond Egypt, and his fatwa was not viewed as a precedent that others must follow.

For Shi'ite Muslims, Khomeini's 1987 fatwa led to policies supporting medical and legal transition in Iran. Those policies, however, also introduced new means of erasure of lesbians and gay men, whose sexual orientations are seen as "curable" by means of gender change surgery.

Both rulings had implicit problems. They do not address the structural obstacles of sexism that prevent those assigned female from accessing legal and medical transition. The rulings also assume trans identity always leads directly to swift and successful medical transition.

Nonbinary Muslims

Notably, rulings in favor of transition omit mention of nonbinary individuals and others who may not want or be able to medically transition. Coupled with stigma associated with crossdressing, this forces a devastating choice: comply with accepted norms for one's sex assigned at birth, transition and comply with the "opposite" gender's norms, or live in constant conflict with society, excluded from community with no door through which to enter—often literally.

Exceptions do exist, however. In some Muslim cultures, gender-nonconforming individuals assigned male at birth have been recognized as an alternative gender. The *khwaja sara* (often called *hijra*) communities of Pakistan and India are perhaps the best-known example—especially since their legal recognition as a third gender in Pakistan in 2009 and in India in 2014. Other examples include Oman's *khanith,* Nigeria's *'yan daudu,* and Indonesia's *waria*. In recent years, holders of these traditional identities have faced dual challenges: from those who would have them conform to traditional binary gender norms and those who would have them adopt Western ideas of trans identity.

Ignorance and Prejudice Remain

Frequently, knowledge of trans-affirming rulings does not reach the average Muslim or ease prejudice. Trans Muslims continue to face discrimination, ostracism, or even violence. Some find acceptance in their religious communities, but many do not. Some do not take the risk of finding out, choosing to remain connected to their communities while concealing their true gender, if they have not transitioned, or choosing not to reveal their history, if they have transitioned. Many, though, join the two thirds of American Muslims who are "unmosqued," or not affiliated with any mosque.

Beyond the Religious Sphere

The 20th and early 21st centuries saw waves of feminism and movements for gay, lesbian, bisexual, and, later, trans rights, which pushed issues of gender equality, sexual orientation, and gender identity into the public eye around the world. At the same time, the Internet allowed trans Muslims to access information and connect with others.

Building Community

Initially, contemporary trans Muslims in the West found opportunities to come together in settings with other LGBTQIA+ Muslims. The first organized gathering of trans Muslims in the United States took place at a 1999 conference of Al Fatiha, an organization for LGBTQIA+ Muslims that was founded in 1998 by Faisal Alam, a cis queer man, and included three trans people on its *shura* (advisory council). In 1999, Faizan Imaan and other British LGBTQIA+ Muslims came together and soon formed Imaan in the United Kingdom. In 1991, Salaam Canada was founded by El-Farouk Khaki, a cis gay lawyer and activist, and then closed due to threats of violence in 1993; in 2000, it relaunched as the Salaam Queer Muslim Community. In 2011, LGBTQIA+ Muslim leaders in the United States formed a new organization, the Muslim Alliance for Sexual and Gender Diversity, which hosts retreats and advocates for LGBTQIA+ Muslims.

Virtual Communities

While a limited number of trans Muslims met in person, many more gathered in virtual spaces such as chat rooms, listservs, and email groups. In 1999, the email group Iman served feminist Muslims who identified as lesbian, bisexual women, or trans. The TransMuslims email group, started in 2001 by Al Fatiha, grew to over 500 members and existed until Yahoo terminated its group platform in 2019. With the advent of social media, new opportunities to connect included the Trans Muslim Support Network on Facebook and Tumblr.

Trans Muslims in the Wider Community

Trans Muslims sometimes find support outside the Muslim community, among those with whom they share other identities, such as disability or South Asian ethnicity. Anti-Black racism in the dominant U.S. society and within Muslim communities has contributed to some Black trans Muslims seeking support in Black-specific community and creating Black queer and trans Muslim spaces.

Trans Muslims have a role in the larger trans movement as well. Since 2011, the Philadelphia Trans Wellness Conference has included Muslim prayers and workshops led by trans Muslims who formed the Trans and Muslim Project, backed by Transfaith, a multifaith organization that supports trans religious and spiritual leadership. On the legal front, Gabriel Arkles, a trans Muslim attorney, served on the team that brought a trans woman's wrongful termination case to the Supreme Court, which ruled in 2020 that LGBTQ+ individuals are protected by the 1964 Civil Rights Act that bars sex discrimination.

Trans people of Muslim faith or background also have brought their experiences into the public eye. In 2015, British filmmaker Faizan Fiaz used their expertise as a video journalist and their personal experience as a nonbinary Muslim of Pakistani ancestry to create the award-winning film *Poshida: Hidden LGBT Pakistan.* In 2018, genderqueer writer Yas Ahmed and artist Zulfikar Ali Bhutto co-curated "The Third Muslim: Queer and Trans* Muslim Narratives of Resistance and Resilience," an exhibit of work by over a dozen Muslim artists. Trans playwright Mashuq Mushtaq Deen won a 2019 Lambda Literary Award for his play *Draw the Circle,* a queer tale of love and Muslim family. In 2020, J Mase III, a Black trans queer poet and educator with roots in Christianity and Islam, and Lady Dane Figueroa Edidi, who also has Muslim ancestry, coedited *The Black Trans Prayer Book,* an interfaith volume featuring the work of Black trans people. That same year, Zeyn Joukhadar, an award-winning Syrian American nonbinary writer, released *The Thirty Names of Night,* a novel about an Arab American trans boy. Along with lesser known creations, these works offer glimpses into the variety of trans Muslim experiences.

Hope for the Future

Creating Space for Religious Inclusion

Slowly, the doors of religious communities have begun to open to trans Muslims. In South Africa, the Al-Fitra Foundation mosque was founded by

gay Imam Muhsin Hendricks in the early 1990s to offer acceptance and healing to queer Muslims. In 2007, Ani Zonneveld and Pamela K. Taylor—both straight cis women—founded Muslims for Progressive Values, which advocates for LGBTQIA+ Muslims and has an inclusive congregations network. In 2009, El-Farouk Khaki, Troy Jackson, and Laury Silvers cofounded the El-Tawhid Juma Circle (ETJC) in Toronto. ETJC serves an international community with live-streamed services and a network of affiliated congregations that welcome LGBTQIA+ Muslims.

Moving Beyond Welcome

In the early 21st century, trans Muslims began taking religious leadership roles and creating new, affirming religious communities. In 2008, Shinta Ratri opened the first Islamic school for Indonesia's *waria* community. In 2010, Tynan Power launched the Pioneer Valley Progressive Muslims/Masjid Al-Inshirah in Northampton, Massachusetts, establishing the first known congregation founded by a trans Muslim man. In December 2016, Mahdia Lynn, a trans woman, cofounded Masjid Al-Rabia in Chicago as a pluralist congregation centering inclusivity and accessibility. Masjid Al-Rabia's community reaches Muslims around the world and is active in prison ministry.

Muxes

In the Istmo region of Oaxaca, Mexico, there exists a culture of indigenous origins known as the Istmo Zapotec. The Zapotec civilization has been present in this region since at least the 14th century, thus predating the arrival of Spanish conquistadors in the 16th century. Historical records demonstrate that conquistadors witnessed indigenous males who dressed in female-typical attire and had sexual relations with other males. Although such behavior was condemned by the Spanish and repressed throughout the following centuries, more recently, there has been a renaissance in diverse gender expression in this region. In the 21st century, the Istmo Zapotec have become known for their unique and accommodating approaches to gender diversity because of their recognition of a "third" gender category for males who are sexually attracted to cisgender men (i.e., androphilic). These third gender androphilic males, known as *muxes,* are recognized by the Istmo Zapotec as distinct from cis men and women while possessing characteristics of both. This entry will provide a brief overview of different aspect of muxes' lives, including their gender presentation, sexuality, and their acceptance and discrimination by their families and the Istmo Zapotec in general.

The term *muxe* likely originates from a Zapotec adaptation of the Spanish word *mujer,* which means "woman." However, it has also been suggested that the word *muxe* derives from the word *namuxe,* which is Zapotec for "shy," "timid," or "cowardly." At the time of writing, the Istmo Zapotec use the term *muxe* to describe a male who is sexually attracted to cis men and enacts both male-typical and female-typical gender roles. It is widely believed that when there is one muxe in the immediate family, there is likely to be at least one other among one's extended relatives. Research

provides support for this belief and indicates that muxes have a greater number of *muxe* relatives than do heterosexual men. This same research indicates that approximately 3% to 6% of males among the Istmo Zapotec population are muxes. Although this prevalence rate is not high, the muxes are nonetheless very prominent members of Istmo Zapotec culture, in part because they enjoy a high level of public acceptance.

Muxes' Gender Role Enactment

The Istmo Zapotec recognize two types of muxes: *muxe gunaa* and *muxe nguiiu* (Zapotec for muxe "woman" and muxe "man," respectively). Muxe gunaa routinely dress in women's clothing and present publicly in a relatively feminine manner, whereas muxe nguiiu routinely dress in men's clothes and present publicly in a relatively masculine manner. According to some definitions, both types of muxes would be considered transgender given that their gender identity differs from the gender assigned to them at birth (i.e., male). However, muxe nguiiu generally enact male-typical gender roles and are more accurately described as cis. In contrast, muxe gunaa enact generally female-typical gender roles and are thus accurately described as transgender. Despite these differences, both types of muxes are relatively feminine when compared with cis heterosexual males, albeit to differing degrees.

As early as age 3, feminine boys can be identified as muxes by family and community members. Common displays of childhood femininity in muxes include preferences for playing with dolls and other "girl" toys, having girls as playmates, imitating mothers more than fathers, preferences for dressing up in girls' clothing, and doing house chores that are usually given to girls more often than boys. Additionally, Istmo Zapotec mothers sometimes take their muxe children out into the market and the streets in order to teach them business trade, as they normally would with their daughters. These female-typical displays during childhood usually occur alongside an aversion toward male-typical activities such as rough-and-tumble play, playing with "boy" toys, and having boys as playmates. Although quantitative research has found that both types of muxes recall more sex-atypical behaviors during childhood than heterosexual men, transgender muxe gunaa recall significantly more than cis muxe nguiiu.

Muxes are known for embracing a variety of occupations within Istmo Zapotec culture. While many are considered feminine (e.g., clothing designer, embroidery, sewing, cooking, and event decorators), their occupations also include ones traditionally held by men (e.g., cab drivers, public officials, and politicians). Previous qualitative studies of muxes in the workplace have found that wage labor jobs (e.g., structured labor under a contract of employment) are mostly occupied by muxes who have a masculine gender expression (i.e., muxe nguiiu), while self-employment is more common among muxes who have a feminine gender expression (i.e., muxe gunaa). Other studies have found similar associations between social class and muxes' gender role enactment. Cis muxe nguiiu tend to come from higher social classes and work in structuralized occupations, whereas transgender muxe gunaa typically come from lower social classes and are routinely self-employed. Despite these differences, both types of muxes socialize together and, for the most part, consider each other to be members of the same community.

Male Same-Sex Sexuality Among the Istmo Zapotec

Both types of muxes are primarily attracted to masculine male sexual partners, but there are salient differences in their sexual preferences. Muxe nguiiu often engage in sexual interaction with members of their own group (e.g., cis muxes), but they typically prefer cis masculine men who self-identify as "straight." In contrast, muxe gunaa almost never engage in sexual interaction with other muxes. Instead, they seek out cis masculine "straight" men known as *mayates* (e.g., Spanish for "dung beetle") for romantic and sexual activity. Mayates engage in sexual activity with muxes by performing the insertive role during anal intercourse. They frequently do so because muxes offer them economic incentives such as money, food, alcohol, or clothes, but the desire for sexual pleasure is also a motivating factor. Despite engaging in sexual behavior with muxes, mayates mostly consider themselves "heterosexual" and routinely have sex with, and marry, women.

Mayate self-identification as "heterosexual" men is rooted in how male sexuality is conceptualized in many parts of Mexico. Labeling of an individual as "heterosexual" or "homosexual" is not contingent on the sex of the partner but is predicated instead on the roles performed during anal intercourse. While males who take the receptive role are labeled "homosexual," those who take the insertive role are labeled "heterosexual." As such, engaging in sexual intercourse with muxes, whether cis or transgender, does not make the mayates "homosexual" in the eyes of the Istmo Zapotec community as long as they take the insertive role. Nonetheless, mayates usually speak about their sexual encounters with muxes only to select confidants, choosing instead to hide or even deny such activity when questioned by others. This suggests that mayates are not nearly as well accepted as muxes.

Muxe Acceptance

Muxes typically enjoy a high degree of acceptance in the Istmo region. Perhaps the largest display of community of acceptance is La Vela de las Auténticas Intrépidas Buscadoras del Peligro (The Festival of the Authentic Intrepid Seekers of Dangers). This 4-day festival is celebrated in honor of the muxes each November in Juchitán de Zaragoza—the largest city in the Istmo region of Oaxaca. More than 10,000 locals and foreign visitors attend this festival. During the morning on the second day of the festival, a mass is held at a local Catholic Church in honor of Saint Vincent so that he can bless the muxes and the festivities. This religious display demonstrates how the local church not only accepts the muxes but also integrates them in their activities. Muxes contribute to the city of Juchitán de Zaragoza and the Istmo region in general by teaching locals about domestic violence, sex education, and AIDS awareness, thus facilitating further community integration. For these reasons, many foreigners and locals have deemed Juchitán de Zaragoza a "Queer Paradise."

There are several "folk" explanations as to why muxes are so accepted and integrated into Istmo Zapotec culture. For example, a local myth states that families turn their last-born sons into a muxe, so that they can help with household chores and assist their mothers in the local markets. Another explanation for muxes' widespread acceptance is based on the belief that muxes are hard workers and that they invest their earnings in their families. This is further highlighted by the belief that while sons and daughters will eventually get married and move out, muxes will stay with and take care of their parents during old age. Because of this, some families say that having a muxe offspring is a blessing from God. Finally, others suggest that muxes are highly accepted because they enable the local festival system through their work as embroiderers, designers, decorators, and artisans. It has been suggested that the series of traditional parties and festivals carried out yearly in Juchitán de Zaragoza represent one of the core components of the local economy. By facilitating the local festival system through their occupations, muxes also make important contributions to the economy of the region. Whatever the reasons may be for their widespread acceptance, the consensus is that muxes display numerous altruistic behaviors toward their families and make many positive contributions to the city of Juchitán de Zaragoza and the Istmo region at large.

Muxe Discrimination

Despite enjoying a high degree of acceptance, muxes often experience varying levels of discrimination throughout their lives. During childhood, some muxes deal with parents who are not accepting of their feminine behaviors and sometimes employ physical punishment to deter such tendencies. In school, muxes are often teased and bullied by boys when they refrain from playing "boy" games and socialize with girls instead. Some parents demand that muxes marry women and have children, and in some instances, muxes comply with these demands despite being exclusively attracted to cis men. Muxes, who manage to obtain wage labor jobs, typically do not wear female-typical attire because they fear that doing so would put their employment at risk. While the citizens of the Istmo region embrace gender diversity, the formal workplace still enforces national Mexican gender roles by implementing dress codes, which constrain muxes to a cis presentation. Thus, wage labor occupations are usually out of reach for muxe gunaa who dress in a female-typical manner on a daily basis. Similarly, there are some festivals and parties with strict dress codes

that deny access to muxes if they wear female attire. Altogether, the various struggles faced by muxes suggest that the reputation of Juchitán de Zaragoza, and the Istmo region of Oaxaca, as a "Queer Paradise" is an overstatement that masks the more nuanced realities of muxes' daily lives.

N

Naming Practices

Naming practices typically describe a multitude of cultural customs in which expecting parents, or a group of familial members, choose the fore- and middle name(s) for their newest family member. The reasons for which names are selected vary across time, place, and culture, yet gender is the most common influence regardless of nationality, race, and class. Accordingly, naming practices are inspired by cultural notions of gender—even those names chosen because of their androgynous character. Given forenames, just like gender, are presumed to be stable and therefore unchanged throughout a person's lifetime. The predicament, then, is when one's gender identity does not match the name given at birth. This entry considers naming practices, the role of names as related to gender identity, and name change processes within a U.S. context.

Names rely on linguistic systems and cultural patterns that themselves are gendered. Factors like name length, number of syllables, spellings, and phonetic pronunciation create patterned gender associations. Name recognition commences because of these cultural cues that facilitate feminine, androgynous, and masculine distinctions and associations. Hence, the unfamiliarity of names is an effect of gendered patterns, which are shaped by race, ethnicity, and nationality.

Forenames and surnames invite a person into personhood, belonging, and recognition. Forenames establish unique notions of an individual, and they also rely on taken-for-granted notions of gender, race, ethnicity, class, religion, and national origin. Such assumptions are problematic when given forenames do not match gender identity. Because forenames are based on the gender binary, being called a name that is gendered female or gendered male can cause discomfort and distress for persons who do not identify with assigned birth sex. Androgynous forenames, however, may not cause discomfort and distress for the same reasons as the names that are based on the gender binary. It depends on whether a person's gender identity aligns with the name or not and if they experience misgendering because of their given name. Indeed, androgynous names are most often given to people assigned female at birth more than people assigned male. In turn, over time, androgynous names become associated with female people. Thus, names and naming practices among trans people are an important element of social and legal gender transition.

The majority of trans persons want to change their given forename so it better aligns with their gendered sense of self. Nicknames often emerge first as individuals try them on, and over time, these transform into new names based on sense of fit. For more permanent name changes, trans people take multiple approaches. For some, renaming practices expand across significant time periods, whereas for others, name selection happens more quickly. Some trans people include intimate partners, parents, and significant family members in their renaming practices. Such inclusion both honors parents' initial authority in naming decisions but also facilitates relationship maintenance between parent(s) and (adult) child. Also true,

however, is that parents can be resistant to name changes, since they are the originators of a person's initial name(s). Ultimately, family naming traditions, trends, aesthetics, cultural tradition, and religious belief systems are part and parcel of renaming choices among trans people.

It is commonplace for binary trans-identified people to choose names within the gender binary. Conversely, nonbinary trans people frequently and deliberately choose androgynous names so that their gender is not easily recognized as in alignment with their gender embodiment. However, this is not to say that androgynous names are only chosen by nonbinary trans people or that binary trans people do not choose androgynous names. Androgynous names are intentionally chosen as a technique to resist gender normativity.

Naming is also a disciplinary tool of possession, which simultaneously upholds systems of the nation-state, white supremacy, patriarchy, and transnormativity. For example, during U.S. chattel slavery, enslaved African persons were renamed according to their white slave masters. The colonial system of marriage renamed women such that their surname became the same as their husband's, legally collapsing them into their husband's possession and establishing maiden names as an effect of patriarchy. The medicalization of gender transition created gatekeeping mechanisms as detailed in the World Professional Association for Transgender Health (WPATH) Standards of Care (SOC) guidelines. Versions 5 through 6 (1998–2011) of the SOC required trans people to legally obtain new names, stating that forenames needed to be gender appropriate, which effectively upheld white, middle-class transnormativity.

In the United States, name changes are accomplished via common-law processes and civil law procedures. Civil law procedures are costly, and they rely on juridical oversight and the requirement to publish all previous and new names in newspapers of general circulation. Name changes among trans people have been based on assumptions of deception and criminality. Post-9/11 surveillance systems that rely on data-matching processes have extended these assumptions. Identity credentials, like names and gender, that do not match across identification documents (e.g., driver's license, social security records, passports), get flagged as suspect. Data-matching security techniques bleed into institutional structures that shape access to life opportunities. For example, identity credential matching is customary within educational (e.g., federal student aid forms, diplomas) and employment (e.g., Social Security Administration, previous employment referrals) processes; such verification practices produce eligibility and legitimacy. In this way, as numerous critics have observed, both trans people and immigrant peoples navigate systems designed to monitor, discipline, and exclude them based on white supremacy, patriarchy, and transnormativity.

Renaming practices among trans people can be important expressions of the self, and in turn, choosing a new name can be seen as a transformative act of resistance.

National Center for Lesbian Rights

The National Center for Lesbian Rights (NCLR) is a nonprofit legal organization based in San Francisco, California, that seeks to achieve civil and human rights for LGBTQ+ people through

litigation, legislation, and public education. NCLR has litigated many cases involving trans plaintiffs and helped to pass laws and policies protecting trans and LGBTQ+ people in employment, housing, sports, public accommodations, health care, prisons, and schools.

History and Staffing

NCLR was founded in 1977 by Donna Hitchens, then a recent law school graduate, as the Lesbian Rights Project of Equal Rights Advocates, a national legal organization for women. Hitchens initially envisioned NCLR as an advocacy organization for lesbians, particularly for those losing custody of their children. Almost immediately, however, NCLR began to represent gay, trans, and HIV+ people, as well as lesbian parents, and to advocate on a wide range of legal issues facing the entire LGBTQ+ community. NCLR incorporated as an independent not-for-profit in 1988, and despite the continued use of "lesbian rights" in its name, it has become an inclusive LGBTQ+ organization whose staff and advocacy reflect the full spectrum of LGBTQ+ people and issues.

Throughout its history, NCLR has been led by strong, influential national leaders. In 1990, Donna Hitchens, its founding executive director, become the first openly lesbian candidate elected to the California bench. Roberta Achtenberg succeeded Hitchens as NCLR's executive director in 1983. Achtenberg later served as the assistant secretary of the U.S. Department of Housing and Urban Development, becoming the first openly lesbian or gay public official whose appointment to a federal position was confirmed by the U.S. Senate. Achtenberg was succeeded by Elizabeth Hendrickson, who was appointed to California's Alameda Superior Court in 2003.

NCLR's longest-serving executive director, Kate Kendell, led the organization from 1996 to 2018. Under her leadership, NCLR gained national visibility in the legal campaign for marriage equality and expanded its reach by creating a Washington, D.C. office led by Maya Rupert. Rupert worked with numerous federal agencies to adopt internal policies prohibiting anti-LGBTQ+ discrimination and was instrumental in securing protections for LGBTQ+ people in the regulations implementing the Affordable Care Act.

Since 2020, NCLR's executive director has been Imani Rupert-Gordon, who joined the organization after leading Affinity Community Services, the nation's oldest Black LGBTQ+ social justice organization. Under Rupert-Gordon, NCLR has expanded its commitment to working in coalition with other civil rights movements and to ensuring that the legal gains made by the LGBTQ+ movement are accessible to all LGBTQ+ people.

NCLR's legal director, Shannon Minter, is a trans man. When Minter came out as trans in 1996, he was the first openly trans person to undergo a gender transition while working for a national LGBTQ+ legal organization. Along with Phyllis Frye and other trans leaders, Minter played a key role in urging other national LGBTQ+ organizations to embrace trans issues and include trans people as part of their missions.

In 2000, NCLR sponsored Christopher Daley to start the Transgender Rights Project, with the goal of incubating an independent legal organization for trans people in California. Two years later, Daley and Dylan Vade launched the Transgender Law Center, which has become the largest legal advocacy group for trans people in the United States.

Legal Work

NCLR has won precedent-setting legal victories for trans people in all stages and aspects of their lives. For example, it has represented trans youth in discrimination cases, resulting in trans students being able to use school bathrooms and locker rooms in keeping with their gender identities and requiring school administrators to address anti-trans bullying. In 2014, NCLR helped abolish Medicare's decades-long ban on transition-related surgeries, and in 2018, the group obtained one of the first rulings in the country that said that discrimination on the basis of trans identity is sex discrimination under the Affordable Care Act. NCLR has also succeeded in cases where trans people were being discriminated against in the workplace, such as being fired when outed by identity documents or denied transition-related care under their employers' health insurance policies. Some of the group's litigation in support of trans people's right to access transition-related care has involved prisoners. An NCLR case resulted in

the federal Bureau of Prisons, the largest prison system in the world, ending its discriminatory policy of banning the initiation of hormone medication for trans prisoners. In 2019, NCLR won a landmark victory in *Edmo v. Corizon, Inc.,* in which a federal court ruled that an incarcerated trans woman must be given medically necessary gender-affirming surgery. In another recent case, NCLR partnered with GLBTQ Advocates and Defenders to challenge President Trump's ban on military service by trans people.

Programs and Campaigns

Since its founding, NCLR has launched innovative programs and campaigns to address emerging issues. In 1993, NCLR became the first national legal organization to create a project for LGBTQ+ youth. NCLR's Youth Project focuses on keeping LGBTQ+ youth out of the foster care and juvenile justice systems by promoting policies that support them and their families and encourage family acceptance. It also created a specific Transgender Youth Project to provide legal information and support to trans youth and, in 2014, launched Born Perfect: The Campaign to End Conversion Therapy to prevent LGBTQ+ children and youth from being harmed by this dangerous practice. As of 2020, the campaign has helped pass laws banning conversion therapy in 20 states and more than 70 localities.

In 2001, NCLR began a Sports Project, which has represented LGBTQ+ athletes and coaches in discrimination cases and advocated for trans-inclusive policies in K–12, collegiate recreational, and professional sports. One of NCLR's first trans youth clients was Jazz Jennings, who had to fight for her right to play on a girls' recreational soccer team. On the K–12 level, NCLR has worked with 18 state athletic associations to develop policies that permit trans athletes to play school sports.

Other NCLR programs include its Family Protection Project, which provides resources and assistance to poor and low-income LGBTQ+ parents and couples, and its Immigration and Asylum Project, which gives direct legal services to LGBTQ+ immigrants, detainees, and asylum seekers. Since 1994, the project has represented nearly 500 LGBTQ+ asylum applicants.

National Center for Transgender Equality

The National Center for Transgender Equality (NCTE) was founded in 2003 to be a voice for trans people in Washington, D.C. and around the country. NCTE has been the leading advocate for trans-inclusive federal policies and one of the main organizations working for trans rights on the state level. The group conducted the two largest studies of trans people in the United States and, in 2017, created a political affiliate to increase the importance of trans issues in electoral politics.

NCTE was founded by Mara Keisling and a diverse board of directors after years of activists being concerned about the dearth of trans voices in federal policymaking. The federal government often ignored and was sometimes hostile to trans people in developing policies. Deep frustrations also existed regarding what had been the "gay rights movement," which was thought to be too slowly evolving into an LGBTQ movement. Lesbian and gay rights organizations, most of which had no trans staff members and did not include trans people as part of their mission statements, were viewed by policymakers and the public as speaking for trans people. The lack of a strong, professional trans voice in D.C. was viewed

by many trans people as inappropriate and insufficient, even though NCTE was preceded by organizations such as the National Transgender Advocacy Coalition (all-volunteer), GenderPAC (which focused on gender), and the Transgender Civil Rights Project of the National Gay and Lesbian Task Force (now the National LGBTQ Task Force).

NCTE's theory of change has been that public policy can improve or harm trans people, and therefore trans people must have an assertive, knowledgeable voice at every policymaking table. This is especially true at the federal level, where decisions are made through specific and established institutions and relationships. Early on, NCTE undertook successful work on state and local policies and in getting "gender identity" added to federal hate crimes legislation (which passed in 2009 as the Matthew Shepard and James Byrd Hate Crimes Prevention Act). But its primary initial policy goals were transforming the gay rights movement into the LGBTQ rights movement and adding gender identity and expression language to the Employment Non-Discrimination Act (ENDA), which was then pending before Congress and covered only "sexual orientation."

A significant step toward making the gay rights movement more inclusive occurred in 2007, when NCTE and the National Gay and Lesbian Task Force led a coalition of more than 425 trans and LGBT groups known as United ENDA, which demanded that Congress not pass ENDA without gender identity protections. Although no version of ENDA was enacted, the United ENDA campaign was a turning point in LGBTQ activism, leading to the solidification of an LGBTQ movement fully committed to trans rights.

ENDA had been the legislative priority for lesbian and gay rights organizations since it was first introduced in 1993, but gender identity protections were not included until 2007. ENDA was replaced in 2015 with the Equality Act, which would ban discrimination based on sex, sexual orientation, and gender identity not just in employment but also in public accommodations, education, housing, and credit. The Equality Act has yet to become law as of 2020.

NCTE has grown increasingly involved in state advocacy, which has included pushing states to make it easier for trans people to change names and gender markers on identification documents (e.g., driver's licenses and birth certificates) and to enact policies requiring health insurance companies and systems (such as Medicaid) to cover transition-related health care. NCTE maintains comprehensive resources on its website to assist people with navigating the complex state and local policies on ID documents, as well as navigating health care systems. NCTE has also supported efforts to pass state antidiscrimination laws and fought against state legislation that would allow discrimination against trans people. In 2016, NCTE played an instrumental role in condemning North Carolina's law that required people to use public restrooms that matched the gender marker on their birth certificates. As a result of coalition work against it, the law was never fully implemented and the governor who championed it was not reelected.

During the Obama administration, NCTE focused on changing federal administrative policies, which led to more than 100 policy advancements for trans and LGBTQ people. Victories were achieved throughout the federal government, including on ID documents, housing (shelters), immigration, federal prisons, employment, education, health care, and military service. Another successful approach during the Obama administration was advocating for federal sex discrimination laws to be interpreted to include protections based on gender identity, while also pushing for explicit legal protections based on gender identity/expression.

During the Trump administration, NCTE was a leader in resisting federal policy rollbacks. In 2018, NCTE launched the "Won't Be Erased" campaign in response to a leaked White House memo that outlined a strategy to overturn protections for trans people. To document and raise awareness of the anti-trans actions of the Trump administration, NCTE also catalogued each loss on its website in a project called "The Discrimination Administration" (https://transequality.org/the-discrimination-administration).

In 2008, NCTE worked with the National Gay and Lesbian Task Force to establish and conduct the National Transgender Discrimination Survey, which, with over 6,700 participants, was the largest study of the trans population at the time. Previously, advocates had to rely almost entirely on telling individuals' stories of discrimination to try to persuade policymakers. In 2015, NCTE conducted a larger study, the United States Transgender Survey, which had nearly 28,000 participants. It is now the go-to source for data about trans people.

In 2017, in response to Trump's election, NCTE created the National Center for Transgender Equality Action Fund (NCTEAF), an affiliated 501(c)(4) political organization, in order to expand governmental lobbying and participate in electoral politics more fully. In 2019, NCTEAF launched a project called "TransForm the White House," in which Democratic presidential candidates gave video interviews about how they would support the trans community. In 2020, NCTEAF became the first national LGBTQ rights organization to endorse Joe Biden's candidacy for president.

Neurodiversity

Multiple studies have found that the trans population contains greater neurodiversity than the cisgender (cis) population, with estimates of 5% to 15% of trans people also being autistic. These studies have focused primarily on the higher prevalence of one type of neurodivergence—autism. This higher prevalence indicates that autistic experience contributes to greater gender diversity or, alternately stated, that allistic (nonautistic) experience contributes to reduced gender diversity in the population. Neurodivergent trans people experience barriers to care among autism service and gender care providers, owing to lack of understanding regarding this intersectional experience. These barriers may be lowered through increased education about the trans autistic experience and by including trans autistic people in the development of research, training, and clinical practice guidelines. This entry describes the nature of neurodiversity and the spectrum of autism, differences in how people with autism and other forms of neurodiversity process information and how this shapes their experiences, the effects of societal responses to individuals who manifest neurodiversity, the intersection of autism and trans identities, and suggestions for how care providers, educators, and families can contribute to the care and support of trans autistic people.

Language and Definitions

A neurodiverse population includes people with a range of neurological experiences, just as a gender-diverse population includes a range of gender identities, such as agender, cisgender, binary trans, and nonbinary trans people. A neurodiverse population may include people whose cognitive and sensory experiences fall within a societally accepted norm (neurotypical) and those whose sensory and cognitive experiences fall outside the norm (neurodivergent). Examples of neurodivergence include Tourette's syndrome, attention-deficit/hyperactivity disorder (ADHD), autism, traumatic brain injuries, dementia, and synesthesia. Autistic people have been leaders in the neurodiversity rights movement, which recognizes neurodivergence as a diversity issue among minds, rather than as pathology. Many of the principles for supporting trans autistic people will also be applicable for supporting other forms of neurodivergence among trans people, including ADHD, Tourette's syndrome, and intellectual disabilities.

Autistic Experience

Autism is a heterogeneous experience, consisting of a number of differences in sensory and executive functioning, each of which may be experienced to

different degrees. In addition, the intensity of these sensory and processing experiences fluctuates depending on internal changes, such as fatigue or discomfort and external context, such as weather and social welcome. For example, when an individual is experiencing fatigue or social rejection, they may have a harder time with auditory filtering or cognitive processing, as they have less energy available and are under greater stress. This is true for everyone; autistic people experience greater stress due to sensory processing issues and social discrimination and rejection and, hence, are more affected by their physical and social environment.

Commonly, the autism spectrum has been envisioned as a line, moving from least to most neurotypically functioning. Problems with this linear perspective include the positing of neurotypical ability as the baseline for measurement, a bias toward neurotypical observers' interpretations and perceptions of behavior, and failure to represent the variance in degrees of autistic traits within an individual. For example, a nonspeaking person may have high sensitivity, mixed memory abilities, very high language comprehension, and low oral communication abilities. Autistic heterogeneity is better represented with a spiderweb chart, with different rays from the center representing the extent of each characteristic.

Autism has been medically described by deviance from neurotypical presentations with regard to social communication, interactions, behaviors, and activities. The autistic person's experience differs from the observer's experience and is fundamentally one of sensory and cognitive processing differences. Failure to be met, or to fit, in a neurotypically centered world, along with chronic oppression, stigmatization, and abuse, causes distress from an early age. This distress, when filtered through autistic neurology, results in the communication differences and behaviors that people associate with autism and with significant levels of anxiety, depression, and health consequences.

Neurological Differences Among Autistic People

Autistic people have a saying: "If you've met one autistic person, you've met one autistic person." This saying reflects their understanding of the wide diversity in the mix and the degree of neurological traits. Nevertheless, there are enough similarities to create a general understanding of perceptual and cognitive characteristics. Sensory experiences tend to be heightened, while some report hyposensitivity. It is not yet clear whether this hyposensitivity begins as hyposensitivity or is a numbing of preexisting hypersensitivity. Sensitivity differences between autistic and allistic people are not confined to externally generated phenomena such as texture, sound, light, smell, and taste but also involve internal sensory experiences. The internal felt senses of interoception, proprioception, and vestibular sensation can also be hyper- or hyposensitive or a combination of the two. Interoception is the experience of the internal processes in the body and how we feel, and it includes sensations such as digestion, hunger, fatigue, and the composite body states associated with emotions. Proprioception relates to the sense of body in motion and involves how we perceive movements and, relatedly, how we enact movements. Vestibular sensation is generated in the inner ear and gives us our sense of balance and rotational movement. Autistic people are often assumed to be overreacting or underreacting to outer and inner sensations when they are truly overwhelmed in a world that is shaped by allistic sensitivity levels. Their response, whether it is direct expression of this hypersensitivity, dissociation, or masking of reactions, is one of the strongest indicators of perceptual and neurological traits of autism.

Cognitive processing differences are present in autism as well as other forms of neurodivergence, such as ADHD. For autistic people, these differences may be experienced as disabilities that require accommodation or compensatory actions in school, work, and other settings. They also may be experienced as strengths in contexts in which different neurological processing is beneficial to the self or others. Frequently experienced cognitive processing traits include differences in various forms of memory, processing speed, problem solving, and verbal fluency. These differences are often connected to feelings of shame, frustration, and anxiety. Deficits in the social cognitive skills of being able to predict another's experience (theory of mind) and being able to modulate behavior (executive functioning) are part of the medical profile of autism. However, allistic people tend to have poor theory of mind with respect to understanding autistic people's experience. In addition, insufficient attention is given to the cognitive and social

strengths of autistic people. Cognitive strengths include originality, strong long-term memory, visual thinking, hyperlexia, intensive focus, and specific skills in arts, mathematics, and logical thinking. Social cognitive strengths include non-judgmental listening, direct and honest communication, and loyalty.

Neurodivergent Experiences of Oppression and Community

Autistic and other neurodivergent individuals do not know they are different until this experience is made evident to them through ongoing correction, rejection, frustration, discrimination, and abuse. There is a growing recognition that others are doing something that they are not doing—something nuanced or complex that is sometimes difficult to perceive or, if perceptible, is difficult to enact, such as being dishonest. Efforts by caregivers, schools, and other providers to affect changes in their behavior often result in feelings of unworthiness and disempowerment.

These experiences of rejection and "wrongness," along with chronic sensory overload, lead to common co-occurring depression and anxiety, including social anxiety and obsessive–compulsive disorder. Co-occurring mental health issues may be diagnosed before autism is perceived, particularly if the individual is able to mask or compensate for their cognitive differences and their hypersensitivity.

Autistic people often form community online, where many of their sensory and social issues are greatly reduced. They may also find companionship with others who share their interests, such as theater, animal care, writing, or gaming. It is through reading online autistic and trans autistic accounts that many undiagnosed or misdiagnosed people recognize that they are autistic and trans autistic. This recognition is often, but not always, a relief, depending on the levels of internalized stigma and of family and community support.

Trans Autistic Experience

Like autistic people, trans people have a stigmatized invisible difference, which is not apparent at birth. At birth, individuals are assumed to be cisgender and neurotypical. As an individual behaves differently from what is expected, they experience correction or rejection. When an individual has both trans and neurodivergent experiences, they have an intersectional experience of oppression generated by both their neurodivergence and their gender divergence. Until fairly recently, and still in many places, efforts have been made to coerce gender-nonconforming youth to conform to behaviors expected of the gender they were assigned at birth. Similarly, the leading approach for working with autistic youth, Applied Behavioral Analysis (ABA), uses intensive behavioral strategies to condition a child to behave more neurotypically. In both cases, authentic experience and expression are rejected or suppressed, to be replaced with inauthentic behavior that conforms to societal expectation and the comfort of neurotypical cisgender people. The gender-affirming model, in which clinicians and families honor an individual's personal experience of gender, supports individuals in finding and living in their authentic selves. A neurotype-affirmative model of care would be predicated upon the same goal of honoring personal authentic experience, even if that experience is outside of the observer's own experience or understanding.

Intersectional Experiences: Gender, Age, Race, and Class

Intersectional experiences are felt within each identity group and in society as a whole. Trans autistic people may encounter accessibility issues, misunderstanding, and marginalization in both the transgender community and the autistic community. External to these identity groups, they experience extra challenges in the cisgender neurotypical centric world, including from many providers. Within identity communities, trans autistic people in autistic-led communities are gaining support, as evidenced by the renaming of the Autistic Women's Network to the Autistic Women's and Nonbinary Network. Within the transgender community, there is also more acceptance than in the cisgender neurotypical community, yet autistic needs are often not accommodated for, making these spaces less accessible or welcoming.

Trans autistic people experience more difficulty with cisgender neurotypical providers who have an implicit bias toward neurotypical and binary performance of trans identity and expression. This bias can be seen when some researchers and clinical

providers ascribe trans and gender-nonconforming behavior of autistic people as not "true trans" expression but an artifact of autistic characteristics, such as special interests or sensory preferences. Providers may fail to recognize how autistic experience can affect trans expression, and so they discount trans identity. For example, a trans autistic person may choose not to change their clothing or way of speaking while still asserting their trans identity. They may feel that it is most important that they are comfortable in their clothing and do not see the need to behave differently to be who they already are. Autistic care providers may misapprehend or misattribute gender-nonconforming expressions or gender dysphoria–related behaviors to autistic quirkiness or distress rather than considering the possibility of a trans identity.

Trans autistic people also experience other intersectional identities, including gender, race, social class, sexual orientation, immigration status, faith, and ability. Race and class have a significant impact on the identification and support of autistic people, with autistic people of color frequently being diagnosed later, not diagnosed, and misdiagnosed with conduct disorders. Trans women and transfeminine nonbinary people experience additional oppression due to transmisogyny. Immigrants may have additional fears related to disclosing either identity for fear of impact on the immigration process. People with physical and mental disabilities have to work even harder to access support for both trans and autistic care and community needs.

Supporting Neurodivergent Trans People

The combined experiences of intersecting oppressed identities, along with the internal stress of very sensitive systems and gender dysphoria, contribute to significantly higher morbidity and mortality for trans autistic people. These physical and mental health issues result from stress-related illnesses and from greater difficulty accessing responsive health care. By ameliorating these stresses, supporting effective advocacy, and rethinking care for trans autistic people, providers and caregivers can help reduce these health impacts.

The most important work for improving care and support is for providers, educators, and families to unlearn cisgender and neurotypical perceptions and expectations of communication and behavior. This is best done by reading and listening to trans autistic accounts. By creating trans- and neurodiversity-informed instructional materials, processes for access to services, sensory-friendly environments, and alternative communication modalities, trans autistic people will be better supported at home, in clinical settings and schools, and in the community.

News Media Representations

News media serve as key sources of political information for the public. Historically, they have served as the predominant source of political information, although in the digital age, alternative sources, such as blogs and social media, have emerged to rival news media's monopoly. Nonetheless, news media remain significant sources of political information and serve as central players within the networked flow of facts, opinions, and perspectives that shape the contours of public debate on social and political issues. Importantly, news media have served, alongside entertainment media, as a primary means through which the cisgender public has received information about trans issues and identities. As such, they have been key determinants of the cis public's understanding of trans identity, as well as of their attitudes and opinions toward trans people and their civil rights.

This entry summarizes the historical development and current state of trans people's representations in news media. First, it addresses early news media representations of trans people in the United States and Europe, beginning in the first half of the 20th century and continuing through the midcentury period. Next, the entry characterizes the state of trans representation in the traditional news media of newspapers and broadcast television from the 1990s through the mid-2010s, discussing the role of these representations in the (de)legitimation of trans issues and identities. Third, it describes representations of trans people in digital news media since the mid-2010s, attending to the ways digital news representations compare and contrast with the representations of the legacy press as both the driving technologies of news media *and* social norms and values have evolved. Finally, this entry addresses the global press, describing news media's contentious role in the exportation of "trans" as an identity category central to modern society into countries across the world.

Early News Media Representations of Trans People

The earliest deliberate representations of individuals we would today classify as "trans" in news media emerged in the early 1900s, albeit without the terminology of "trans" identity. (Although news media had previously reported on instances of crossdressing and cross-gender behavior, these instances were rarely presented as indicative of an internal sense of gender identity.) By the 1930s, popular press outlets in the United States and Europe were publishing occasional accounts of medical innovations in sexual transformation, largely pioneered by German physician Magnus Hirschfeld and his associates at the Institut für Sexualwissenschaft in Berlin. In Europe, the most notable of these stories were published in Germany and Denmark, and they reported on the series of surgeries performed under Hirschfeld's supervision on Danish painter Lili Elbe. In the United States, these medical marvels were reported and debated in popular magazines and sexological journals, where they gave exemplars of possibility to other would-be transsexual women and men. Importantly, because of the medicalized nature of their coverage, these news reports provided *only* the exemplar of transsexuality—that is, of the transformation of one's anatomy via endocrinological and surgical intervention to match that of the gender "opposite" to that which one was assigned at birth. The notion of a trans identity that was not transsexual would not emerge in news media until much later.

One such individual who saw models of possibility in the news reports of the popular press was Christine Jorgensen. Jorgensen, who had been born and raised in New York City, traveled to Denmark, where she received hormone replacement therapy until she was eventually granted governmental permission to undergo genital reconstruction surgery in the fall of 1951. By that time, the term *transsexual* had been popularized as a category of self-identification by German American endocrinologist Harry Benjamin, and it ultimately became a household term following the media circus surrounding Jorgensen's operations in 1952. For most people in the United States, the unprecedented media coverage made them aware of transsexuality as a phenomenon for the first time and informed their first impressions of who trans people were.

Importantly, the news coverage that brought trans identity into public consciousness presented a very particular *form* of trans identity. Transness was, per the news media of the era, the desire to be a "normal" person of the "opposite" gender, driven

by an innate sense of the "wrongness" of one's body (i.e., the sex one was assigned at birth), which could only be overcome via the wonders of modern medicine. For trans women, who were largely the only trans people represented in news media, part of this desire was the dream of fulfilling the normative role of the middle-class, heterosexual housewife—a dream that was both explicitly and implicitly racialized as white. That is, to be trans meant to be respectable in the eyes of the mainstream U.S. society of the era. The focus on Jorgensen (and other trans people like her) was a deliberate one. Other trans people existed, including trans women of color and working-class trans people, but they did not fit within this vision of respectability, and so they received little attention from the mass news media.

Following the midcentury period and up until the 1990s, this vision of trans identity predominated. When trans people were represented in news media, they were usually trans women, they never identified outside or across the binary of "male" and "female," they were usually straight, and they were usually white. When trans people diverged from these expectations, they were depicted as aberrations and as degenerates. For example, trans people who did not pursue genital reconstruction surgery were frequently represented as "hermaphrodite" freaks who defied the very laws of nature and were, accordingly, portrayed as dangerous to society. Yet even when trans people met these rigid ideas of respectability, they were rarely afforded respect within news media. They were, rather, often portrayed as mentally ill, as unnatural deceivers, or as sexual predators. For example, trans women were often portrayed as gay men who underwent surgical transformation for the primary purpose of seducing heterosexual men. And these prejudicial constructions of trans identity reverberated in news media representations for a half century and only fell out of favor (but still did not disappear) in the late 2010s.

Trans People in Traditional News Media

The traditional mainstream news media of newspapers and broadcast television—what is often referred to as the "legacy press"—serve a key legitimating role in U.S. politics and society. It is through news media asserting the legitimacy of any given group's social and political claims that the public come to view their issues (and, for minority groups, often their very identities) as worthy of dignified attention. For trans people, representations in traditional news media were, for decades, mostly delegitimating.

By the mid-1990s, thanks both to activist Holly Boswell's 1991 article "The Transgender Alternative," published in the transgender community journal *Chrysalis Quarterly,* and to author Leslie Feinberg, who published the pivotal 1992 pamphlet *Transgender Liberation: A Movement Whose Time Has Come*, *transgender* had emerged as the term of choice for people whose gender identities differed from the sex they were assigned at birth. Transgender terminology largely came to supplant the term *transsexual,* as *transgender* afforded a broader conception of trans identity than *transsexual,* which carried with it associations of rigid binarity and normativity. Changes in the terminology used by news media, however, lagged significantly, with *transgender* becoming the dominant term only in the 2010s.

Indeed, the language and discourses used to discuss trans issues and individuals in the legacy press remained regressive throughout the 1990s and into the mid-2000s. Alongside the more obvious means of delegitimation, such as the use of slurs and name-calling and the defamation of trans persons' characters, the legacy press enacted four main categories of delegitimation of trans people. First, traditional news media outlets frequently misnamed and misgendered trans people. Often this could take the form of presenting someone's birth name in lieu of their chosen name or else placing their chosen name in quotation marks, as though it were a nickname. Additionally, trans people would be misgendered through the use of pronouns, with news outlets using the pronouns of the gender a trans person was assigned at birth, rather than those of their current gender identity. Even when trans people were not misnamed, they were often still misgendered via pronouns.

Second, legacy press outlets often misrepresented or mischaracterized trans identity, conflating trans identity with other identities, referring to trans identity as a mental illness or the result of trauma, and describing trans women as "men in dresses." Additionally, these outlets would often deploy what is referred to as "wrong-body discourse,"

or the definition of trans identity as having been "born in the wrong body." While this discourse accurately describes some trans people's experience of gender, it restricts the various identities that fall under the term *transgender* to a singular conception of (postoperative) transsexuality.

Third, traditional news media often characterized trans people as "tricksters" who live out their gender identities for the primary purpose of seducing cisgender heterosexuals. While this narrative was most often applied to trans women, usually as justification for violence against them, it was also applied to trans men. Most notably, this narrative was widely used by news outlets reporting on the death of Brandon Teena, a trans man murdered in Humboldt, Nebraska, in 1993.

Finally, the legacy press often sexualized the trans body. Most often this was done through a focus on trans people's sexual organs as the source of gender identity such that trans women were only considered women if they had undergone vaginoplasty and trans men were only considered men if they had undergone phalloplasty. To the extent that nonbinary people were reported on—which they very rarely were—their sexual organs were presumed to hold the "truth" of their "real" gender. Yet even beyond a focus on sexual organs, traditional news media outlets maintained a prejudicial focus on the normativity of trans people's gender presentations, measuring the authenticity of trans people's gender identities against their attainment of a normative cisgender appearance.

Over the course of the 2000s and 2010s, these forms of delegitimation decreased significantly, such that by the mid-2010s, the presence of delegitimating coverage in a news outlet was typically evidence of its overt conservative bias. Of course, this is not to say that coverage was not still limited in several important ways. In fact, many of these delegitimating discourses remained but in more subtle ways. For instance, trans people are frequently discussed in aesthetic terms, with an undue focus on their appearance (even when described complimentarily) as justification for their gender identity. Nonetheless, by the mid-2010s, trans issues and identities were widely held as legitimate within mainstream news media and, consequently, became subjects of legitimate political discussion for the general public.

Trans People in the Digital News Environment

The introduction and proliferation of digital technologies radically transformed the news media environment. The institutions of the legacy press moved online, and new, digital-native news outlets emerged—many of which rivaled, if not surpassed, the audience sizes of their competitor legacy press outlets. Beyond distributing exclusively online, digital-native outlets differ from legacy press outlets in a number of key ways. Perhaps the most important difference is that their issue agendas are more closely linked to those of social media, and they tend to be more transparently attentive to progressive social issues. Considering both the rapid growth of the modern trans rights movement in the 2000s and 2010s and the way social media have afforded trans people platforms for mass self-communication, the rise of digital-native news outlets has considerably affected trans people's representation in news media.

Most notably, trans representations are more frequent in digital-native news outlets than in legacy press outlets, and these representations also tend to be more explicitly sympathetic in their perspective. Digital-native news outlets also present more frequent representations of trans people of color, trans children and teenagers, and trans men than legacy press outlets. Although neither digital-native nor legacy press outlets offer representations proportional in their frequency to the size of the trans population, they have offered a significantly improved vision of trans people's diversity since the early 2000s.

That said, compared to the predigital era, the representations in legacy press outlets, in their own right, have become far more frequent and more explicitly pro-trans. Both legacy press and digital-native outlets offer increased (albeit still infrequent) representations of nonbinary people. And both types of news outlets offer a more robust set of topics that they cover, as trans issues and identities are regarded as legitimate subjects of social and political discussion. For instance, issues of discrimination, anti-trans violence, health care access, military service, and access to public accommodations form a large plurality of the news coverage of trans topics, and each is represented as an important concern for social equality. Moreover,

digital-native and legacy press attention to these issues does not, in the aggregate, differ. That is, the proportion of coverage that digital-native outlets dedicate to any given issue is approximately equal to the proportion of coverage legacy press outlets dedicate to that same issue.

In significant part, improvements in legacy press coverage since the early 2000s can be traced to the influence of digital-native outlets (as well as to the tireless work of trans activists and social movement organizations). Because legacy press outlets must now compete with digital-native outlets for a share of the information market, they must ensure that they are not missing coverage of topics or events being offered by their economic competitors, which would result in a loss of audience. Legacy press outlets, therefore, monitor the content of digital-native outlets and adjust their own coverage accordingly. Moreover, in seeing coverage of a topic or event by their competitors, legacy press outlets come to see that topic or event as legitimate news. Since digital-native outlets began dedicating significant attention to trans issues and identities in their reporting, so too did legacy press outlets. And since digital-native outlets regarded trans issues and identities as legitimate, so too did legacy press outlets. This kind of intermedia agenda-setting effect afforded trans issues and identities a pathway to representation in the wider news environment and to more legitimating representations.

Trans People in the Global Press

Nonnormative gender identities exist and have existed across cultures but often in terms that European and U.S. society do not recognize. In these cultures, understandings of gender variance have produced native identity categories, such as *hijra* in the Indian subcontinent; *muxe* in Oaxaca, Mexico; and *waria* in Indonesia. Within news media, however, these identities are often recast as "trans" identities, collapsing cultural differences into one universalized identity category of Euro-American origin. The source of this recasting is, most often, transnational media companies usually based in Europe or North America, which report on the gender-variant people of these societies as members of a global trans community. However, transnational media companies alone are not to blame. National media in these societies also participate in this conflation of "trans" identities, making the recasting of native gender categories a collaborative project. For example, the *hijra* of India are described in both international and Indian news media as being locked in battles for "trans rights." And similar dynamics are apparent elsewhere.

In other cultures, no native identity categories cover gender variance, and so "trans" is a useful cultural import. In Namibia, for example, the label of "trans" has given gender-variant people both an organizing category of identity and a collective global identity through which to build cross-national solidarity and, in doing so, leverage international news media attention as a means of effecting local change. In still other cultures, news media present simultaneous representations of "trans" identity and other gender-variant identity categories, and these representations often find themselves in tension with one another. For example, in Brazil, both trans and *travesti* are represented in news media, with trans identity being presented as the more "respectable" identity to hold.

Importantly, the label of "trans" is regarded as a superior mode of identification by global news media precisely *because* of its Euro-American origins. For example, in Taiwan in the 1950s, intersex soldier Xie Jianshun was styled the "Chinese Christine" by news media and held up as a symbol of Taiwan's technological and cultural sophistication, which they presented as rivaling the United States. In these contexts, as in others, European and North American culture are presumed to represent a universal default. That is, "trans," as a European and North American concept, is held up as a self-evident category that we should expect to find universally in modern society, and in advancing this idea, global news media essentialize European social categories as the natural state of social existence. However, while the remaking of native gender identities across the globe in a Euro-American model involves familiar dynamics of cultural imperialism, it simultaneously makes nonnormative gender identities legible in a global context and enables a transnational movement for recognition and acceptance. As such, there is an ambivalent tension whereby the global press serves as a vector of cultural power that maintains Euro-American supremacy and, at the same time, advances the

equality of trans people and those whose identities can be recast as "trans" throughout the world.

Nonbinary Genders

Nonbinary genders is a shorthand phrase to reference genders outside of the binary paradigm of man/male and woman/female. *Nonbinary* is a fairly contemporary umbrella term (with a white Western emphasis) that contains many diverse identities and embodiments. For example, some nonbinary identities are fluid or shift over time, while others are static; some nonbinary experiences are muted, some vivid.

Nonbinary people are trans, when understanding trans to be when a person's gender does not correspond to the assignment made at birth. This is because assignment of a sex/gender category at birth is (almost always) compulsorily binary, such that nonbinary people must lay claim to a gender identity outside of what was assumed at birth assignment. However, not all nonbinary people relate to or identify as trans for a range of reasons.

This entry first considers the historical and cross-cultural narratives that lay foundations for the emergence of nonbinary as an identity category. The entry then discusses more recent history and the emergence of explicit genderqueer and nonbinary activisms and communities. The entry continues by sketching some contemporary nonbinary identities, while recognizing that an exhaustive or static list is impossible. The relationship between *trans* and *nonbinary* as social organizing concepts and identity terms is then explored. Finally, the entry summarizes the existing research on nonbinary experiences in contemporary culture and on nonbinary language, expression, and intersections.

History and Culture

It is a common misunderstanding that the gender binary is a monolithic concept "taken for granted" since the beginning of recorded history regardless of context. Over the course of the 19th century, European ideas about sex became codified as scientific or medical, rather than the conventionally accepted responsibility of the church (this was prior

to the conceptualization of "gender" outside of the context of grammar). The result of this was a gradual shift in how "deviance" tended to be understood, increasingly shifting away from "sin" and toward "medical disorder." Sexuality and sex at this time were not conceptualized separately, such that "attraction to/sexual involvement with women" was a fundamental characteristic of "the male sex." If a woman was understood to experience "same-sex" attraction (or have acted upon it), she may have been figuratively understood as "neither male nor female" or, in some contexts, subjected to medical examination for physiological differences (particularly those associated with "hermaphrodites," an antiquated term associated with intersex individuals).

Nonbinary identity categories (that are explicitly understood as such) are a relatively recent phenomenon. For this reason, historical examples of gender diversity have largely been historically conceived as simply "nonconforming" (and, by extension, "deviant") men or women. However, it is possible to look at particular groups of people who lived their lives in particular ways and usefully frame those experiences as outside the gender binary.

For example, eunuchs have appeared in various cultures and historical periods, including the Ottoman, Chinese, and Roman empires. Social stature and physical differences (removal of the testes or also of the penis) could vary between these contexts. It is debatable whether eunuchs were seen as "men" or not, but they certainly fulfilled social roles reserved for them that were not associated with men or women. These roles were not always low status—for example, eunuchs could serve as royal guards for high-status women or be trusted court advisers because their separate status from men rendered them nonthreatening. In Italy, the tradition of castrati singers continued until 1870, with the last castrato, Alessandro Moreschi, living long enough to produce recordings that survive to this day.

The *hijra,* in the Indian subcontinent, demonstrate an intersection between gender, class/caste, culture, and faith. Even while hijra might be understood in Western language as transfeminine, they draw distinctions between themselves and Indian trans women and understand themselves as neither men nor women. Hijra have been culturally recognized and legitimized by the links between their identity and the Hindu faith, traditionally working as performers at events such as births, weddings, and festivals. As Indian society has secularized, hijra have increasingly relied on sex work, compounding their stigmatization with their very low status in caste terms. This was further exacerbated by the sexual norms of the colonialist British Empire, which removed state protections from the hijra and left a negative legacy after Indian Independence. However, the social landscape of India is complex, as hijra have also been recognized enough for a third gender category on Indian passports to have been legislated.

In 1990, diverse Native American and First Nations people coined the intertribal term *two-spirit* as an umbrella category for a culturally specific set of gender/sexual/spiritual experiences that had long existed in these communities. Again, the connection with colonialism is clear here. White settlers had endeavored to eradicate this group, and early anthropological work still suffered from heavy colonialist bias, such that Native American and First Nation communities could recognize negative judgment of their integrated/sacred institutions. They were often reluctant to share information and access with white researchers, who only saw "men dressing as women" (or vice versa).

Discussing any non-Anglo-American and/or historical gender concept is limited when it is done in English due to the ways in which nuanced expression of complex and culturally contingent ideas is bound up with language. In short, some dimensions of culturally specific genders can be lost in translation. Furthermore, assumptions around how gendered socialization practices occur may not hold, particularly historically where even the assignment to a gender category at birth has taken factors other than genitals strongly into account, such as in traditional Native American Zuni beliefs, where ritual interventions before and after birth contributed to the development of "a sex."

The Contemporary Nonbinary Movement

Precursors to the contemporary nonbinary movement include various strands of feminist and queer thought and activism. For example, in the 1970s and 1980s, feminist thinkers such as Sandra Bem and Marge Piercy suggested that activism should focus on dissolving the gender binary and came up with alternative gender categories and pronouns.

During the 1990s and 2000s, many queer activists and theorists argued for the dismantling of the gender binary as part of a wider move to resist heteronormativity. This was framed against the conceptualization of trans people as either *transsexuals,* who were expected to access hormones and surgery in ways that fulfilled expectations and obligations around gender roles, or *transgenderists* and *crossdressers,* who might challenge gender expectations without accessing such medical transition. In 1992, Leslie Feinberg published *Transgender Liberation,* which helped broaden trans to become a wider concept. In 1994, Kate Bornstein's influential work, *Gender Outlaw,* followed by many other outputs, questioned the idea of simply moving from one to another side of a gender binary. Riki Wilchins is credited with first using the term *genderqueer* in 1995, writing that those who transgressed the gender binary and were most visible were the most heavily affected by gender oppression.

Several major shifts occurred in the 21st century that contributed to enabling a more visible nonbinary community. One of these was increasing Internet availability, allowing people to seek information about gender, access labels that relate to personal relationships with gender, and form communities of support around nonbinary experience, as with other communities. Another shift was a move from the aforementioned queer project of dismantling the gender binary to a more identity-oriented politics, with the goal of obtaining rights and recognition for an identified group of nonbinary, or genderqueer, people. However, many in the nonbinary community remain committed to more radical queer political agendas while strategically deploying identity politics tactics in certain areas. This might include a simplification of gendered experience when interacting with health care practitioners, who may act as gatekeepers based on expectations of accounts with "clinical precedent," or avoiding trans-affirmative expression of "identity as choice," owing to the risk of this being misinterpreted to attack trans or nonbinary identities as a "lifestyle."

Key moments in the nonbinary movement include several countries officially recognizing a nonbinary gender category, including but not limited to Nepal, Australia, Argentina, Canada, and Iceland. Different legislation allowed for nonbinary recognition in different ways, for example, enabling a person to get an X-marker for gender on their passport or the production of birth certificates that recognize a third category other than male or female. Other pieces of legislation may not grant legal recognition but allow institutions (banks, health care) to recognize categories beyond the binary via nonbinary gender markers or titles, and others make nonbinary options more accessible in relation to gender-affirming medical interventions.

Other key moments in the increasing recognition of nonbinary genders include increasing mainstream and social media visibility of nonbinary people, such as nonbinary people playing nonbinary characters on popular TV shows, including *Billions* and *New Amsterdam,* and nonbinary communities and hashtags such as #ThisIsWhatNonBinaryLooksLike trending on Facebook and Twitter.

Nonbinary Identities

Nonbinary has become the most common anglophone umbrella term for those who identify with—or experience themselves as—outside of the binary of man/male and woman/female. However, some use the term *genderqueer* in a similarly encompassing way.

Beneath the umbrella of *nonbinary* are a range of further terms that refer to often quite radically different ways of experiencing and expressing gender. It can be helpful to regard this as analogous to all the different gender experiences and expressions possible under a man/masculine or woman/feminine identity. Consider, for example, the different embodiments and enactments of gender brought to mind by *gentleman, lad, dude, boy,* or *guy* or by *lady, queen, womyn, babe, girl,* or *grrl.*

Nonbinary people position themselves in various ways in relation to the gender binary, including occupying places of betweenness, bothness, and beyondness. They also report experiences of gender on spectra from muted or partial to vivid or vital, as well as from static to fluid.

Demi is a prefix used for a muted or partial experience of gender (e.g., demigirl). *Genderfluid* relates to an experience where gender shifts over time, while *bigender* and *pangender* refer to having multiple genders present simultaneously or concurrently. Some bigender and pangender experience overlaps with plural system experience, whereby

people experience themselves as more than one self, sharing a body. *Agender,* or gender-neutral, people experience themselves as having no gender, or no relationship with gender, whereas *third gender* (or sometimes pangender) people experience themselves as being a specific gender beyond the binary. *Genderqueer* and *genderfuck* refer to gender identities and expressions that—intentionally or not—trouble the binary gender system and reveal it to be constructed.

Estimates of the proportion of people who are nonbinary have been difficult to make for several reasons. These include the fact that most survey demographics have, to date, only included binary gender options and the changing cultural landscape regarding nonbinary gender, which means that it has only recently felt like a possible identity for many people and still may not feel possible to many due to continued stigma, invisibility, and unintelligibility.

Additional to these issues is the question of whether nonbinary constitutes identity, expression, experience, or something else that is measured. This issue is similar to the issues troubling the definition of sexuality, where estimates of the proportion of bisexual youth range from a small minority to a majority depending on whether the focus is on identity, experience, or any degree of attraction.

Thus far, studies that have measured the number of people identifying as nonbinary, or something other than male or female, in the general population put the figure at around 0.4%. Estimates of the proportion of the trans population identifying as nonbinary range from as low as 1 in 10 to as high as half, depending on the time, location, and age range of the sample, with numbers highest among queer youth. However, a 2014 study that asked a general population whether they—to some extent—experienced themselves as "the other gender, both genders, or neither gender" found that over a third of people responded in the affirmative.

Nonbinary and Trans

Whether *nonbinary* falls under the trans umbrella or not depends on the ontological approach taken toward transness—that is, what is *trans?* If trans is taken to be a description of a state of being (which for sake of argument will be defined as "a person with a gender that differs from the assignment made at birth"), then nonbinary people are trans by virtue of the fact that no one is assigned "nonbinary at birth." If trans is considered an identity category, however, then there are various people who would fall into the above trans concept who would never wish to be referred to or understood as trans—men and women with a trans history and nonbinary people alike. Community research conducted by the Scottish Trans Alliance suggested that a small majority of nonbinary people do identify as trans, and a significant number are unsure. Reasons given for this include uncertainty or insecurity about being "trans enough" to "count" as trans (particularly among people who have yet to access, or do not wish to access, gender-affirming medical interventions).

Nonbinary genders can introduce complexity for binaries other than the gender binary. For example, if nonbinary is conceptualized as a new way a person can relate to gender identity and to birth assignment, some individuals may disrupt the notion of a simple "cis/trans binary." Florence Ashley created the term *gender modality* to refer to the relationship between gender and assignment at birth. Cis and trans are therefore gender modalities; however, the framing creates space for other gender modalities. Nonbinary may be some people's genders, an umbrella category that contains more specific nonbinary gender identities (which may or may not also be experienced or considered as trans), or it may be some people's gender modality (or any combination of these things). It is important to acknowledge that nonbinary and intersex are separate and separable phenomena. Nonbinary people may be intersex, and intersex people may be nonbinary, but the distinction is important so as to pay attention to group-specific experiences and forms of marginalization, particularly nonconsensual cosmetic surgical interventions undertaken soon after birth to "normalize" intersex genitalia by cissexist, endosexist (non-intersex) sociocultural standards.

Nonbinary Experience

Research on nonbinary experience thus far has focused largely on the challenges of being nonbinary in a gender binary world and the impact this has, particularly on the mental health of nonbinary people.

An interesting historical counterpoint to this emphasis can be found in Sandra Bem's 1970s research on psychological androgyny. This research found that those who scored highly on scales of both cultural masculinity and cultural femininity fared better in terms of mental health and other outcome measures than those who were more binary in their characteristics. Bem argued that such "androgyny" or gender flexibility was something to encourage and fought to render the gender binary obsolete or inconsequential. This work suggests that nonbinary experience, per se, is by no means detrimental. Rather, it is identifying or expressing yourself in nonbinary ways—within a world in which the gender binary is heavily policed—that is the problem.

Studies so far suggest that nonbinary people share with trans women and men many of the difficulties of being trans in a cisnormative world. They also share with bisexual people many of the difficulties of being outside the heteronormative binaries of being a man/woman attracted to women/men.

A particular feature of both bisexuality and nonbinary gender is cultural invisibility or erasure, with very little nonbinary representation existing and any representation of people outside the binary that does exist being as confused, immature, suspicious, mad, and/or dangerous. Both groups frequently experience being "re-closeted" on coming out because people disbelieve them or forget that a nonbinary option exists. This results in an experience of repeatedly having to decide whether to face the potential risks and emotional labor of coming out or the secrecy and silence of remaining closeted.

Where bisexual and nonbinary experience part company, however, is that sexuality is far less foregrounded than gender in everyday experience. While bisexual people have to experience being misidentified and facing difficult choices around coming out, under specific situations, misgendering is a many-times-a-day experience for most nonbinary people, each time requiring a difficult on-the-spot decision whether to correct the error or let it slide. Misgendering from strangers can be hard for many nonbinary people because it reinforces the fact that the wider world simply has no comprehension of a vital part of their experience. Misgendering from friends and family can be hard for many because congruent mirroring of oneself by others is generally a key feature of a sense of belonging and well-being.

The findings on mental health suggest that nonbinary people have higher rates of mental health difficulties than people of other genders, with over a third attempting suicide at some point. Many report experiences of discrimination and violence, in addition to everyday microaggressions, and a third report physical assault. There is also an ongoing stress involved in negotiating gender binaries in relation to public spaces and groups—especially under conditions of high cultural transphobia—including public toilets, changing rooms, sports teams, and so on. This also relates to whether to express oneself and/or identify in nonbinary ways in different settings. Many nonbinary people feel unable to identify as nonbinary—or to express themselves as they would like—across all aspects of life, particularly in workplaces, with family, and in public.

Nonbinary Language, Expressions, and Intersections

Perhaps the most researched aspect of nonbinary experience so far is language, given that nonbinary people have developed new language—and adapted existing language—in order to express themselves and be referred to in ways that are congruent. While there have been no studies to date on the impact of using affirmative language, it is possible to generalize from the impact of the use of masculinist and sexist language on women—and the use of cisnormative language on trans people—to conclude that exclusionary language will negatively affect nonbinary well-being, cognitive capacities, and performance, and the inclusive language will affect these areas positively.

In addition to the diverse and burgeoning range of category labels for different kinds of nonbinary experience, expression, and identity, a key feature of language is gender-neutral pronouns, so that nonbinary people can be referred to without adopting a binary he/him/his or she/her/hers. In English-speaking cultures, it is currently (in 2020) most common for nonbinary people to adopt they/them/their pronouns, and this is the option included on social networking sites such as Facebook.

Many have questioned the grammatical correctness of this; however, "they" pronouns have been used to refer to singular individuals dating back to Shakespeare and, even earlier, to Chaucer; also, language shifts over time, as evidenced by the generic singular "you," which now replaces the historical "you (plural)/thou (singular)" distinction. Some nonbinary people also prefer the fact that "they" can be both singular and plural, if plurality is a feature of their experience of selfhood. However, some nonbinary people do not like the association of "they" with plurality or feel it is important to have a new, more visibly nonbinary set of pronouns. Other pronouns that have been explicitly developed for nonbinary people include ze/zir/zem, sie/hir/hir, and per/per/pers. Some use their name rather than pronouns.

Nonbinary people also often adapt and adopt new language in relation to names, titles, and gendered ways of addressing people. For example, many change their names formally and/or informally to gender-neutral forms such as shortened versions of birth names, initials, hyphenated names incorporating more than one gender, or new names. The gender-neutral title *Mx* has now been adopted by many institutions. Gendered terms of address such as "Sir/Madam" and "ladies and gentlemen" have been replaced formally in some official contexts such as the London tube network, although such changes have been hard to enforce. Gender-neutral terms that many nonbinary people use include *partner* instead of *boy/girlfriend, sibling* instead of *sister/brother, offspring* instead of *son/daughter,* and *parent* instead of *mother/father.* The terms *nibling* and *auncle* have been developed as gender-neutral alternatives to *niece/nephew* and *uncle/aunt.*

As with nonbinary identity labels, there are diverse ways of expressing nonbinary gender day to day, with many of course remaining in relatively binary modes of expression due to the high risk of discrimination and hate crime. Those who are able to express themselves more openly may, for example, adopt androgynous modes of expression or employ different clothing, makeup, hairstyles, and so forth in different contexts.

As always, however, there is a tendency for new normativities to emerge within nonbinary communities, often reproducing wider axes of privilege and oppression. This can be seen already in relation to visible gender expression, with the vast majority of available images of nonbinary people being young, white, nondisabled, slim, and androgynous to masculine-of-center. It is vital to be mindful of the intersections that affect how a person experiences being nonbinary in the world. To provide just some examples, fewer options are available for fat bodies in terms of gender-neutral clothing; assigned-male-at-birth (AMAB) people adopting any "feminine" gender expression are stigmatized and policed more harshly than the other way around; assigned-female-at-birth (AFAB) people of color adopting "masculine" gender expression face a greater risk of violence and police brutality than those who are white, where such concerns are unlikely to figure in their decision-making process.

The recent dissatisfaction with and disruption of gender as a binary frame is arguably part of a wider reexamination of social norms around relationships and intimacy, disability, education, and other factors. The rejection of the gender binary has political as well as self-actualizing dimensions, with liberatory aspirations.

Nondiscrimination Laws, Federal, State, and Local

Nondiscrimination laws are used in various contexts as a policy remedy for addressing unequal treatment that affects groups that are systematically marginalized, including trans people. This entry includes a definition of nondiscrimination laws, an overview of the history of such laws in relation to trans people, and the current standing of federal, state, and local laws in the United States, including advocacy efforts that have excluded trans people. The entry concludes by offering some critiques of nondiscrimination laws in relation to trans people.

What Are Nondiscrimination Laws?

Nondiscrimination laws are policies put into place at an organizational, local, regional, or national level to attempt to change behavior—specifically, to discourage behaviors that treat people differently based upon a particular identity or characteristic and result in inequitable access to opportunities and resources. Nondiscrimination laws are usually developed to address differential treatment affecting specific groups of people who are systematically marginalized due to institutional, interpersonal, and intrapersonal norms. Examples of characteristics that may be included within nondiscrimination laws include race, ethnicity, skin color, age, national origin, religion or creed, disability status, gender, sex, and sexual orientation. Nondiscrimination laws related to trans people intend to counteract the institutionalization of trans stigma by creating disincentives for violence, harassment, and discrimination that target trans people. These laws intend to create a more affirming environment, including norms and behaviors that uphold the rights of trans people to be treated equally. Such an affirming environment could help to reduce stress and stigma in trans people's lives.

Since the late 20th century, nondiscrimination laws that incorporate protections for trans people have existed in some U.S. states and cities, usually by including *gender identity* and/or *gender expression* as protected classes. Gender identity is one's sense of one's gender, whether woman, man, genderqueer, agender, two-spirit, or nonbinary. Gender expression is how one expresses oneself through clothing, grooming, appearance, and behavior, whether in a feminine, androgynous, masculine, or fluid manner. Nondiscrimination laws that include gender identity and gender expression as protected classes are meant to stop discriminatory behavior that targets people based upon how they identify their gender (including those whose gender identity may differ from dominant Eurocentric expectations for their sex assigned at birth) as well as how they express their gender (including changing one's gender expression over time).

Nondiscrimination laws occur in a variety of settings. In employment, these laws are meant to protect someone from unfair treatment in hiring, promotion, and firing decisions, as well as in terms of general treatment on the job. Nondiscrimination laws for public accommodations include ensuring one's ability to access and receive fair service or treatment at places open to the general public such as parks, retail, restrooms, restaurants, and doctor's offices. Health care settings may have nondiscrimination policies to protect trans people's experiences in receiving services from doctors, nurses, mental health professionals, medical staff, and other professionals. Similar protections may also be put in

place in social services settings, such as a homeless shelter or an agency providing services for older adults. Nondiscrimination policies in schools can help promote equal access to education and fair treatment for students in K–12 settings as well as in vocational schools, colleges, and universities. There are also nondiscrimination laws that apply to housing, which are meant to protect trans people from being unfairly denied housing, evicted, or restricted from buying or renting a home.

History of Nondiscrimination Laws for Trans Individuals

Over hundreds of years, Western societies have shifted from hierarchical and feudal systems to more democratic ones that still faced significant challenges to achieving full human equality, such as eliminating slavery and ensuring equal access to property. Certain groups have continued to face discrimination that impedes their access to opportunities that are provided to cisgender (cis), heterosexual, able-bodied white men. Nondiscrimination laws have been seen as one possible remedy for these inequalities, with the earliest nondiscrimination laws in the United States existing in some form since the end of the Civil War.

Through the 1970s, however, there was a lack of laws protecting trans people from discrimination, and federal courts had determined that the 1964 Civil Rights Act did not protect trans people. Efforts to bring legal cases related to trans discrimination were focused on addressing disadvantages based upon outgroup stigma. In 1989, the court decision in *Price Waterhouse v. Hopkins* shifted the trajectory on legal claims related to trans discrimination, determining that "gender stereotyping" cannot be used as a criterion for job promotion and violates Title VII of the Civil Rights Act of 1964. This decision created the possibility for trans plaintiffs to bring cases before the courts related to claims of discrimination. For example, in March 2005, in *Barnes v. City of Cincinnati,* a trans plaintiff who had been demoted as a police officer due to transitioning had successfully made a case of discrimination under Title VII. At the same time, many courts have indicated that nondiscrimination protections for sexual orientation do not incorporate trans identities. Some trans individuals have also sought protection under disability laws. States such as New Jersey have found that trans people are included under their state's disability law. However, trans people are overtly excluded from the Americans With Disabilities Act of 1990, although this law did offer protections for people living with HIV from discrimination in housing, health care, and employment based upon this health condition.

Local governments and states have also been developing nondiscrimination policies. In 1975, Minneapolis became the first city to prohibit employment discrimination based upon gender identity and gender expression, and in 1993, Minnesota adopted the first statewide nondiscrimination law that encompassed trans people. In recent years, research has examined the value of nondiscrimination laws for the well-being of trans people. Trans people living in communities without nondiscrimination laws have been found to experience greater perceived community stigma, which in turn is associated with greater lifetime victimization, discrimination, and suicidality, as well as current anxiety.

Despite efforts to change laws to include protections of nondiscrimination for trans individuals, there continues to be no federal law protecting trans people from discrimination in employment. Since 1994, when Senator Edward (Ted) Kennedy introduced the Employment Nondiscrimination Act, there have been efforts to change federal law regarding nondiscrimination in employment, although for many years, such bills only incorporated sexual orientation. These bills have been repeatedly introduced in subsequent years and have had backing of groups such as the AFL-CIO and LGBTQIA+ organizations.

Over time, advocates have pushed for inclusion of gender identity and gender expression within nondiscrimination bills. Some of the first states to have such protections enacted into law include Minnesota, Rhode Island, New Mexico, and California. Research indicates that states are more likely to adopt trans nondiscrimination policies when neighboring states have done so, and states that adopt a nondiscrimination policy in one sector (e.g., housing) are more likely to subsequently adopt a policy for another sector of life. While in recent years, more states (and, indeed, countries around the world) have adopted nondiscrimination laws protecting trans individuals, recent research has found that implementation and enforcement of such laws are often weak, with lack of clarity about who

carries out such laws, inconsistent policy language across entities, lack of time and resources for enforcement, and a lack of specificity about how trans people are protected from disclosure and retaliation.

With regard to health care discrimination, California was the first state (in 2005) to have a law stating it is illegal to deny health insurance coverage to a patient simply because they are trans; all services covered for cis patients had to be covered for trans patients as well. In the past, insurers would typically deny coverage to trans people by saying that being trans was considered a preexisting condition or that transition-related services were elective or cosmetic.

Current State of the Law

Historically, trans communities have been marginalized and excluded within the broader LGBTQIA+ rights movement. Additionally, these movements have been framed by mainstream media to exclude trans representation. Until recently, the leadership of trans people (primarily trans people of color) who put their lives on the line during historical events that have shaped LGBTQIA+ culture, such as the well-known Stonewall and Compton's Cafeteria Riots, have been disregarded. While the narrative of these events often centralizes the idea that white, gay, cisgender men led these riots, in actuality, trans people and those transgressing gender such as drag queens were the initiators of action against anti-LGBTQIA+ police brutality.

In the development of nondiscrimination policy, trans communities have also been excluded or disregarded. While looking at the LGBTQIA+ rights movement through recent history, much policy change was geared specifically to gay men and lesbians, leaving out many sexual and gender identities. One example of the exclusion of trans people from the broader LGBTQIA+ movement was specifically around a federal antidiscrimination policy. In 2006, the Employment Nondiscrimination Act (ENDA) was introduced in Congress. It included protections around both sexual orientation and gender identity; however, there were concerns that the bill would not pass with the inclusion of gender identity. The bill's sponsors subsequently removed the trans-inclusive language from the bill. This move was opposed by most national LGBTQIA+ organizations at the time, except for the Human Rights Campaign (HRC), which received much pushback for supporting an exclusionary bill. The ripples of this choice and the mistrust between HRC and the trans community are still felt 10+ years later.

Another example of trans people being excluded from the broader movement was during the repeal of the U.S. military policy "Don't Ask, Don't Tell." This policy essentially forced service members to remain in the closet or be discharged from the military if known to identify as LGBTQIA+, and when repealed, the changed law left out protections for trans service members who chose to serve in the military. Furthermore, the marriage equality movement centered the voices of white, middle-class gay and lesbian couples, using a heteronormative narrative that centered the story that gay and lesbian people are just like heterosexual people. This narrative reinforced many ideas that continue to oppress much of the LGBTQIA+ community and specifically trans people. For example, this narrative was based on the idea that everyone wants to or can get married, not acknowledging the critique that marriage is rooted in patriarchal, sexist, and misogynist ideals that reinforce the gender binary. Furthermore, many couples with one or more disabled people cannot get married or would risk losing their health care benefits and aid due to outdated eligibility requirements for programs such as Medicare, Medicaid, Social Security Income, SNAP, and Section 8 housing. This exemplifies how the marriage equality movement was centered specifically to reinforce the status quo, alienating much of the LGBTQIA+ community, especially those with multiple marginalized identities.

The acknowledgment of intersectionality in policy creation and implementation is challenging. As the trans community is highly diverse and made up of people with different races, ethnicities, financial securities, sexualities, genders, relationship orientations, abilities, sizes, and creeds, it is challenging to pass legislation at federal and state levels that accounts for everyone, which is why nondiscrimination policy is essential to bridging the gaps in policy that intentionally or unintentionally exclude all or some trans people. Throughout the Obama administration (2009–2017), much progress was made for integrating trans-inclusive nondiscrimination policy into various settings. However, there are still many gaps, and some of the progress was undone by the Trump administration (2017–2021) and continues to be challenged within the courts.

Federal Nondiscrimination Landscape

As of early 2021, there is no federal nondiscrimination law that protects trans people from discrimination. However, various interpretations of the term *sex* or *gender* have provided some nondiscrimination protections for trans people at the federal level. These include the following:

Employment: Within the Civil Rights Act of 1964, Title VII protects individuals from employment discrimination on the basis of color, race, national origin, sex, and religion. The Equal Employment Opportunity Commission has interpreted both gender identity and sexual orientation to be covered under sex discrimination. Many courts have agreed with this interpretation, including the 6th Court of Appeals. The Supreme Court decided the matter in June 2020, ruling in a case (*R.G. & G. R. Harris Funeral Homes Inc. v. Equal Employment Opportunity Commission*) that Title VII protects trans people from employment discrimination (two other cases decided at the same time affirmed that LGBQ people are also protected under Title VII). The Biden administration extended the ruling in 2021 by issuing an executive order that stated that all federal laws that prohibited sex discrimination would be interpreted as including discrimination on the basis of gender identity and sexual orientation.

Public Accommodations: Currently, there is not a federal law that explicitly provides nondiscrimination protections on the basis of gender identity or sexual orientation in public accommodations, as current law protects only race, color, religion, national origin, and disability.

Health Care: Health care nondiscrimination can be quite complex, as insurance coverage can range from various public and private options that are regulated at federal or state levels dependent upon the type of coverage.

- Within the Affordable Care Act, Section 1557 prohibits discrimination in health care and coverage due to color, race, national origin, sex, age, religion, and disability. This includes gender identity in the interpretation of sex and requires federally funded health program to treat trans patients in accordance with their current gender identity. The Trump administration took steps to remove prohibitions against discrimination related to gender identity and sexual orientation in the Affordable Care Act and other health care regulations, which the Biden administration has sought to restore.
- Veterans Health Administration/TRICARE covers some trans-related care, but not all. It specifically excludes coverage for most, if not all, gender-affirming surgeries.
- Medicare currently covers trans-related care such as routine medical care, hormones, and gender-affirming surgeries on a case-by-case basis.

Education: Title IX is a federal law that protects students, parents, guardians, and employees from sex discrimination in federally funded educational activities and programs. In 2014, the Office of Civil Rights within the U.S. Department of Education released a memo that interpreted sex to include gender identity. The Trump administration reversed this policy, but the Biden administration returned to the trans-inclusive interpretation.

Housing: Housing programs and homeless shelters that receive federal funding from the U.S. Department of Housing and Urban Development (HUD) cannot discriminate against trans people through the Fair Housing Act and the Equal Access Rule. However, the Trump administration changed these policies to allow shelters to make their own rules about housing trans clients, enabling them to deny housing to trans people or to require that trans people be housed according to their sex assigned at birth. Under the Biden administration, HUD reaffirmed that trans people are covered by the Fair Housing Act and the Equal Access Rule.

State and Local Nondiscrimination Landscape

While federal nondiscrimination policies may have a broad reach affecting states and localities, many laws and policies are first passed at organizational, local, or state levels and set a precedent for informing federal policy. State nondiscrimination policies can be implemented in various ways, whether through legislative action, executive action, or a state commission or board interpretation of sex including gender identity. The following details state and local policies as of early 2021.

Employment: Many employment nondiscrimination policies originate at organizational or institution levels. For example, large companies, universities,

and not-for-profit organizations may implement nondiscrimination policies that included protections around sexual orientation and gender identity. Counties, cities, and states also can take similar action in the absence of federal policy. Twenty-two states, D.C., and two U.S. territories prohibit employment discrimination on the basis of sexual orientation and gender identity.

Public Accommodations: Twenty-one states and D.C. have nondiscrimination protections for public accommodations.

Health Care: Twenty-four states have prohibitions for trans exclusions in private insurance, 16 states have laws that protect sexual orientation and gender identity from discrimination in health care and coverage, 22 states have Medicaid coverage for gender-affirming care, and 17 states have laws requiring gender-affirming care coverage for state employees.

Housing: Twenty-two states and Washington, D.C., have policies making it illegal to discriminate in housing based on sexual orientation or gender identity.

Education: Seventeen states; Washington, D.C.; and Puerto Rico have laws that make it illegal to discriminate against students based upon sexual orientation or gender identity.

Legislative Action Example

In early 2019, after eight attempts, the New York State assembly passed the Gender Expression Nondiscrimination Act (GENDA). Similar to federal laws, state legislatures often have to introduce legislation multiple times before it finally passes. Sometimes bills get stuck in committees, while other times, they may make it to the state house or senate floor and die there.

Governor Executive Order

Sometimes policies get stuck in legislative and city council gridlock and require executive action by a governor or a mayor. In early 2019, Governor Tony Evers of Wisconsin signed an executive order prohibiting state agencies from discriminating against government employees on the basis of sexual orientation or gender identity.

Board or Commission Order

Governing bodies such as a state civil rights commission or state board of education can also issue nondiscrimination protections for trans people. In the spring of 2018, the Michigan Civil Rights Commission voted to interpret existing civil rights law to incorporate gender identity and sexual orientation under the definition of sex, extending nondiscrimination protections to employment, education, and public accommodations.

Regardless of how a nondiscrimination policy is passed, it requires strategic, long-term collaboration between trans community members, trans organizations, trans allied organizations, decision makers, and elected officials.

Critiques of Nondiscrimination Laws

Whatever the intended effects of nondiscrimination laws, there are a number of critiques of creating such laws as a remedy for transphobia and specifically discriminatory behavior. First, these laws can be seen as placing the focus on individual “bad actors” who express or act upon transphobic beliefs. However, such a focus may do little to confront larger systemic norms that disadvantage and marginalize trans people. Second, while nondiscrimination laws communicate the message that discrimination is unacceptable, these policies actually do very little to change the material consequences of a lifetime of oppression for trans people, let alone the historical inequities that have affected this population. Third, nondiscrimination laws can be seen as promoting a practice of “treating everybody the same” (akin to colorblindness) rather than acknowledging cisgender supremacy and changing larger structures that uphold it. Fourth, such laws could be viewed as not doing enough to address some of the most significant issues for trans people, such as aligning their identity documents, accessing sex-segregated spaces, immigration, criminalization, and the lack of insurance coverage for transition-related medical care. Furthermore, trans people can face significant hurdles in trying to bring legal cases forward through nondiscrimination laws, and there is evidence that implementation of such laws is often lacking. Finally, even though nondiscrimination laws make discriminatory behavior illegal,

scholars in this area have noted that trans-related discrimination continues regularly nonetheless.

Olympic Athletes

Since the start of the modern Olympic Games in 1896, there has not been an athlete who was known to fit the description of an individual whom we might consider transgender today. In fact, no openly trans athlete has ever qualified to compete in the Olympics, although a number have tried. The International Olympic Committee (IOC), which oversees the games, has made it difficult and at times impossible for trans athletes to compete according to how they identify their gender. While no trans athlete has been out when they competed in the Olympics, one of the most famous U.S. gold medalists, Caitlyn Jenner, made worldwide headlines when she disclosed her gender identity in 2015. But for all the attention that Jenner has received, her place in the Olympic record books is just one small part of the history of trans athletes who have pursued an Olympic dream.

Sex Verification

Prior to 2003, the IOC would not allow known trans athletes to compete in the Olympics and specifically required that women athletes be "female at birth" because of the unproven allegation that trans women have an unfair advantage from having been assigned male at birth. Beginning with the Mexico City Summer Games in 1968, women athletes had to undergo chromosomal testing to prove that they were, in fact, female. Despite opposition both from feminist activists, who pointed out that the policy was inherently biased because men were not tested, and from the athletes themselves, many of whom felt it was humiliating and an invasion of their privacy, the policy continued for the next three decades. The test was abandoned prior to the 2000 Summer Olympics in Sydney, Australia, because sport officials recognized that it was inconclusive in proving "femaleness" and ignored genetic diversity. By expecting women to have XX sex chromosomes, the policy discriminated against women athletes with intersex variations—sometimes referred to as differences of sexual development.

The Stockholm Consensus

In a decision that came to be known as the "Stockholm Consensus," the IOC gave trans athletes the opportunity to compete for the first time, in advance of the 2004 Olympic Games. However, the athletes had to adhere to strict provisions: They had to have undergone gender-affirming surgery, specifically the removal of the penis and testicles in the case of trans female athletes; had hormone replacement therapy for at least 2 years before competing in the Olympics; and their gender identity be legally recognized by their country of citizenship.

Sports organizations around the world followed the IOC's lead in adopting more inclusive policies for trans athletes in the 2000s. These included the professional associations for golf, hockey, rugby, and track and field. The National Collegiate Athletic Association (NCAA) issued a policy

recommendation for its member institutions in 2011 that was less restrictive than the IOC's. Because of the age and limited timeframe for eligibility of college athletes, they did not have to first undergo surgery, and only 1 year of hormone therapy was required—and then just for trans women to compete on a women's team.

New Guidelines

After more than a decade of scientific research, as well as changes in social and legal perspectives, the IOC adopted new guidelines in 2015. Similar to the NCAA policy, gender-affirming surgery was no longer required, and trans male athletes were able to compete without any restrictions. Trans female athletes had to maintain a level of testosterone below 10 nanomoles per liter for at least a year prior to competing. This was a radical change in support of trans athletes, yet none still qualified.

A subsequent proposal to cut the 10 nanomoles requirement to 5 was tabled in 2019 because the IOC's medical authorities could not reach a consensus. Reportedly, the guidelines will be revisited after the Tokyo Summer Games, which themselves were postponed until 2021 because of the coronavirus pandemic.

Caitlyn Jenner

Although no out trans athletes have competed in the Olympic Games, Caitlyn Jenner kept secret her struggles with her gender identity when she competed in the 1976 Olympic Games in Montreal, where she won the gold medal and set a world record in the men's decathlon, arguably the most arduous Olympic event. Overnight, Jenner became an international celebrity and a national hero. Ironically, she was considered the all-American male at a time when she did not feel herself to be a man. Jenner's coming out as trans in 2015 resulted in trans people receiving tremendous visibility, including greater attention to trans athletes.

Attempts to Qualify

Hammer thrower Keelin Godsey was the first out trans athlete to compete in U.S. Olympic trials. Although he identified as a trans man, he held off medically transitioning in the hope of qualifying in the women's event for the 2012 Summer Games. He narrowly missed a spot on the U.S. Olympic team, finishing fifth. The first out trans person to qualify for and compete in Olympic trials in the gender with which they identify was trans male athlete Chris Mosier. Mosier had previously made history by becoming the first out trans athlete to earn a spot on a U.S. team for an international championship event when he qualified for the men's duathlon team for the 2016 World Duathlon Championship. For the Olympics, he qualified for and competed in the 2020 trials for the 50K race walk but did not finish due to injury. Although neither Godsey nor Mosier had the chance to participate in the Olympics, it is only a matter of time before an out trans athlete does so. When that time comes, hopefully the focus will be on their athletic prowess and not on the fallacious argument that they have an advantage because of their sex assigned at birth or their transition.

Online Communities

An online community is a group of people with shared identities or interests who use social technologies to connect and interact with each

other. Since the early days of the Internet, online communities have been particularly important means for trans people to connect with similar others, explore identity, share resources, document transition, and work toward activism and advocacy. Some of these communities are for trans people broadly, while others focus on particular trans identities (e.g., trans women, nonbinary people, trans men) or particular identity facets or experiences that intersect with trans identities (e.g., race, disability status, age). Early Internet trans online communities involved high levels of anonymity, which enabled people to safely explore trans identities online. However, when many trans communities moved to social media sites, a new set of challenges emerged related to connections to one's physical world persona, disclosure difficulties, convergence of multiple audiences, and difficulties of moderation and maintaining community boundaries. Future trans online communities would benefit from design processes that include trans people and communities, as well as technology designs that center trans experiences.

The Importance of Trans Communities Online

Trans people frequently seek, form, and participate in communities online, which enable them to connect with other trans people, explore their trans identity, share resources, document transition, and pursue activist goals. These spaces take many forms, such as social media sites (e.g., Instagram, Tumblr, Facebook groups, Twitter), online forums (e.g., subreddits, message boards), chat servers and apps (e.g., Discord, WhatsApp), and other types of social technology. Unlike in-person support groups or physical trans-focused events, online communities enable social connection without having to leave one's home, which can be particularly important for those trans people who do not feel safe or comfortable in the physical world. Online spaces give people more freedom to express identity however they would like, regardless of transition status and whether their physical appearance matches their online persona.

Types of Trans Online Communities

Trans online communities form around many different topics, identities, and experiences related to trans lives. Because trans people each have other salient identity facets in addition to their trans identity, many trans online communities also focus on these and provide space to connect with others who have similar intersecting identities. For example, trans online communities include communities for trans people of color, nonbinary trans people, trans women, trans men, trans people with disabilities, trans people in particular age groups, people undergoing particular types of trans medical procedures or surgeries, trans people with particular health issues, trans people in particular careers, and trans people facing additional specific issues that require support. Trans online communities also sometimes focus on trans activism and community organizing, not only involving trans rights but also issues of racial justice, police accountability, youth activism, and specific advocacy issues (e.g., raising support for trans woman of color CeCe McDonald, who was accused of murder).

Trans Communities on the Early Internet

The early Internet provided many opportunities for trans people to form online communities. In the early 1990s, trans online communities formed in text-based online virtual worlds and chat forums such as MUDs (multiuser dungeons), MOOs (object-oriented MUDs), and bulletin board systems (BBSs). Some prominent examples include LambdaMOO (which was for the broader LGBTQIA+ community but included trans community members) and the Usenet community *alt.transgendered*. However, some trans online communities on the early Internet experienced substantial censorship, leading many trans Internet users to instead create their own homepages and build community around this collection of websites.

Anonymity was an important aspect of the early Internet and is widely regarded as an important mechanism for identity exploration. Much research has focused on "gender swapping" on the early Internet, in which people presented as genders other than their "actual" gender in text-based online communities. While gender swapping was thought to be primarily practiced by cisgender (cis) people, this practice opened up opportunities for trans people, as well as those who may not yet have known they were trans, to experience what it would be like to present online using a different gender. Text-based

online communities, both those that were specifically trans focused (e.g., *alt.transgendered*) and those that were not, provided a mixture of social connection and anonymity that facilitated trans identity exploration online.

Trans Communities on Social Media

The advent of social media presented a substantial shift in how online communities formed and how people were able to present identity online. These fundamental changes in how the Internet operated created many challenges for trans individuals and communities. While earlier social media sites like MySpace allowed users to express their identity however they would like, the rise of Facebook in the late 2000s verged substantially away from the norms of the early Internet by requiring "real names" that were associated with one's physical world identity. Having online identity linked with one's physical world identity created new challenges for trans people, including disclosing trans identity to one's network, changing one's online identity when one's gender changes, and managing multiple discordant audiences in one online space. Additionally, trans communities on social media are frequent targets of online harassment, causing new difficulties in enforcing community boundaries and conducting content moderation.

Despite these challenges, social media emerged as important means for building trans online communities and thus for trans people to find support and resources related to trans identity. Large trans communities emerged on sites like Tumblr, Instagram, Reddit, and even Facebook (via Facebook groups). What constitutes a "community," and how walls are constructed between these communities, differs substantially between different sites. On Tumblr, Instagram, and Twitter, there are no formal boundaries between communities; instead, people use tags/hashtags to signal their affinity to a particular online community and then follow, message, and interact with similar others to build social connections with that community. This lack of formal boundaries means that the community's walls are permeable; any person can choose to use a tag/hashtag and often uses them to harass or troll community members. On Reddit, community boundaries are more defined via separate online communities called "subreddits" that focus on particular topics, such as "Transition timelines," a space for trans people to document and share visual transition progress. Subreddits are often public, meaning that the community walls are permeable by outsiders, and thus they require substantial moderation to reduce online harassment and trolling. Facebook groups, focusing on trans experiences broadly (e.g., "The Facebook Transgender Alliance") or particular subsets of the trans community (e.g., "Trans Men Over 40," groups particularly for trans people of color), are a unique form of trans online community. Because these groups are on Facebook, according to Facebook's rules, group members must use their "real" name and identity to join the group, although many Facebook users break Facebook's terms of service and create separate profiles to use for trans-related content. Facebook groups often have high levels of privacy, being designated as "closed" or "secret" groups and requiring prospective members to answer validation questions before being approved for membership. Finally, increasingly, trans online communities form on Discord, an online text/voice chat server that was initially intended for gamers. These communities resemble early Internet communities in some ways: They are text-heavy and allow anonymity and pseudonymity. Discord servers are often linked to particular subreddits, to allow a group chat–based form of social connection not available on Reddit. Importantly, Discord servers have barriers in a way that many online communities do not, requiring verification and sometimes an invitation from a current member. Nevertheless, these communities must still be heavily moderated by community moderators to maintain safety. Discord's features are conducive to trans online community building and identity exploration.

Tumblr was for many years an important online space for trans communities. However, in December 2018, the site changed its policies substantially and began to ban all "adult" content. Tumblr's adult content classification techniques were notoriously messy and ended up banning much trans content that was not actually explicit. In addition, in trans contexts, a lot of adult content is considered medical, educational, or otherwise important for trans community building. After these policy changes, trans communities seemed to be in need of new platforms to congregate. Preliminary research suggests

that many have chosen Discord to fill some of the gaps left by Tumblr's policy changes.

Trans Online Communities Moving Forward

Moving forward, it is clear that trans people will continue to use information and communication technologies like social media and other online spaces to form communities. Technology-mediated connection is invaluable for trans people to connect with similar others when they are exploring identity, gathering resources, documenting transition, and contributing to activism. Yet it is less clear the extent to which trans online communities will form in dominant sites designed primarily for cis users (e.g., Facebook, Twitter, or future similar sites) or whether trans communities will create their own online technologies and online spaces designed especially by, with, and for trans people. One such example is Trans Time, a social media site currently in beta testing, which was designed specifically for trans people to build community and document transition. Trans people and communities have unique needs, such as the ability for online identity to change over time as one's gender changes (often accompanied by appearance, name, and network changes) and the ability to present multiple identities online simultaneously (e.g., to separate one's audience based on whom one has and has not disclosed their trans identity). Additionally, trans online communities need tailored community-based content moderation that does not unnecessarily ban content or users but that quickly reacts to harassment and trolling. Future technology design must take trans people and communities seriously, as well as involve trans individuals and communities in design processes, to design the trans online communities of the future.

P

Parent Advocacy Groups for Trans Children

Supportive parents of trans children are advocating for their children's rights, equality, and social justice across diverse fields, including in education, legislation, and health care. Parents are drawn into advocacy from direct and indirect experiences of discrimination, cisnormativity, and societal barriers to equality of opportunity for trans children. Some parents volunteer to be part of a public movement for trans children's rights, while others strive to maintain their child's right to privacy. Cis parent–led advocacy can bring with it tensions in cases where cis parents may receive bigger platforms than trans advocates, risking speaking over trans voices. Solidarity and mentoring are important elements of parent advocacy. Sharing knowledge and providing peer support can enhance advocacy efforts at local, national, and global scales.

Parents Become Advocates

As social and cultural visibility of trans people has increased, and as research consensus on the benefits of gender-affirmative approaches has solidified, increasing numbers of supported trans children have begun socially transitioning at a young age. In recent years, parents have increasingly moved, or have been pushed, into active advocacy roles to protect their children's rights and well-being across diverse spheres, including legal, political, medical, familial, and educational domains.

A majority of these parent advocates are cis mothers. Advocacy may start out close to (or within the) home, with one supportive parent advocating to ensure their child is supported by their family, neighbors, and community. Cis parent advocates commonly recall a process of moving from ignorance to awareness, from passive support to active advocacy. They also note a shift from negotiating discrete individualized exceptions for their own child to a wider focus on the systemic changes that are required to tackle structural oppression and inequality.

Advocacy at School

Parent advocates often take their first step toward overtly advocating for their child when they encounter barriers or ignorance at school. Schools across the world remain underprepared for ensuring trans pupils have equality of opportunity, and in many schools, trans children face overt hate and discrimination, including from teachers. Within education, parent advocates have advocated for school-based antidiscrimination policies, trans-inclusive curricula, and schoolwide education.

Within the United States, parent advocacy to school boards has become common in recent years, as trans-inclusive school bathroom access became a source of political and social debate. In Australia, parent advocacy coincided with debates around inclusive education policies and became embroiled in wider societal debates around LGBTQIA+ rights and marriage equality. Where school-focused advocacy efforts are unsuccessful,

and schools remain hostile for trans children, parents may be forced into alternative arrangements, with examples of families moving from one country or province to another, as well as homeschooling—with some countries, such as Chile, having distinct schools for trans pupils who have been failed by mainstream education.

Policy and Legislation

Parent advocates try to meet with politicians and policymakers, raising awareness of the rights violations trans children face, advocating for equality and justice for their children. Advocacy led by trans children, their parents, trans activists, and wider allies has resulted in legislative reform for trans children in some countries—for example, Malta, where there are now no age-based restrictions on correcting legal documents. In South Africa, parent advocates have mobilized, using media to call out and hold accountable government departments for their failure to effectively process trans children's document changes.

Parent advocacy has sometimes resulted in parents and their trans children going to court. Test cases have focused on access to medical care without court approval, such as in Australia, or on the right of children in foster care to access trans-affirmative medical care. Across many countries, supportive parents of trans children have faced court proceedings challenging their affirmative parenting, driven by unsupportive coparents, unsupportive social services, or ignorant and intolerant law enforcement.

Parent advocacy has also focused on the need for trans-affirmative health care, with parents advocating against pathologizing and regressive approaches to trans health care. In the United States, parent advocates have needed to advocate against legislation that would criminalize trans-affirmative parenting and trans-affirmative health care.

Visibility and Privacy

Parental advocacy brings up issues of visibility, privacy, safety, and consent for trans children. Some parents have been thrust into a media spotlight, with no option for privacy. Some parents volunteer for public advocacy, weighing the benefits of future privacy against the need for policy and legal protection in the present, while other parents try to maintain their child's right to confidentiality and privacy, advocating under pseudonyms or through less public means.

Where parents and younger trans children have been public about their experiences, young trans children provide important visibility that can become a critical component of advocacy for trans inclusion in schools and beyond. From parents and young children jointly engaging in advocacy campaigns, to trans children calling out transphobic politicians on national media in Australia, trans children's voices are increasingly being heard.

Movements, Coalitions, Solidarity

Parent advocates learn from, collaborate with, and are supported by trans advocates and wider trans communities. There can also be tensions between parent advocates, the majority of whom are cisgender, and trans youth or trans advocates. At times, tensions have related to parents embracing transphobic narratives around loss and grief or cis parents being given platforms that are not accessible to trans people, with cis parents speaking over trans voices.

Parents can also be thrust into advocacy by a failure of broader rights organizations to champion the rights of trans children. In some countries, LGBTQIA+ rights organizations have omitted trans children from their advocacy, while child rights organizations have overlooked or excluded trans children from their priorities.

Parent advocates also focus on research, peer education, and mentoring, establishing family-focused organizations like Mermaids in the United Kingdom or Gender Creative Kids Canada, places where parents can find information and support, empowering them to better advocates for their children. This peer support and knowledge sharing also occur at a global level: An informal network (IMPACT) links together parent advocates across 14 countries over six continents, exchanging knowledge and offering support, aiming for a better future for trans children worldwide.

Parenthood, Transition to

The transition to parenthood for trans people should be seen and understood in a broader societal context, where trans people are often viewed as unsuitable parents. Such views create barriers to trans people becoming parents. Furthermore, such views affect the decisions that trans people make about whether or not to become parents. Yet despite the potentially negative impact of social assumptions and views about trans people as parents, growing numbers of trans people are choosing to become parents. Some aspects of the transition to parenthood for trans people are similar to those of all parents, including decision making about how to raise children, how to negotiate parenting with a partner (if applicable), and the joys and challenges associated with raising a child. Other aspects, however, are specific to trans people, including the potential impact of gender dysphoria, the impact of other people's views about trans people as parents, lack of health care support specific to trans people's needs, and decision making about disclosing information about one's gender history to children.

Much of the research on the transition to parenthood has focused on transmasculine people, specifically transmasculine gestational parents. Less often have trans women or nonbinary people been a focus of research on the transition to parenthood. Given the differential effects of cisgenderism, it is likely that there will be significant differences between these groups. Specifically, cisgenderism may affect how trans women are viewed as mothers, and current reproductive options limit trans women's options in regard to having children. Dominant gender norms are likely to restrict how nonbinary people experience parenthood. Research has rarely attended to experiences of the transition to parenthood among trans people of color. It is likely that the intersections of multiple points of marginalization further affect the parenthood experiences of trans people of color, people who live with a disability, and/or people who are not financially advantaged.

Barriers to Parenthood

Historically, and still in some countries in Europe and Asia, trans people are subjected to forced sterilization as part of gender transition. This constitutes a significant barrier to people seeking to later become a parent to a genetically related child. Even in countries where sterilization is not mandatory, other barriers exist to future genetic parenthood. These include the lack of information provided by health care providers about reproductive options, the costs associated with assisted reproductive technologies, and a lack of legal protection for trans parents.

Beyond genetic parenthood, trans people may become parents through foster care or adoption. Yet research suggests that trans people are more likely than cisgender people to fear discrimination from adoption and foster care agencies. Discrimination may take the form of prurient questions about a person's gender history, misgendering, a lack of understanding of the specific needs and experiences of trans people, and general disapproval of trans people as parents. Adoption in particular can also be prohibitively expensive for some trans people, thus presenting a significant barrier.

In terms of conceiving of oneself as a gestational parent, transmasculine people may struggle with reconciling social norms about pregnant bodies and their own views about their bodies. Although some transmasculine people may be entirely comfortable with undertaking a pregnancy, they may nonetheless have concerns about how other people will view their pregnant body. Other transmasculine people, while open to the idea of undertaking a pregnancy, may experience considerable gender dysphoria in relation to what it means to be pregnant (especially given the normative assumption

that pregnancy bodies are always female bodies), constituting an additional barrier to gestational parenthood.

Finally, some trans people may find themselves weighing parenthood against gender transition. Although the two are not incompatible, a much-desired and indeed needed gender transition may be seen as a higher-order priority than that of having children. This urgency can affect the decisions that trans people make about future fertility. Furthermore, for some people, views about gametes (egg cells and sperm cells) may be at odds with the use of gametes in order to become a parent, with dysphoria shaping the views of some people about fertility and parenthood. Because both sperm and eggs are so routinely (and normatively) gendered in society more broadly, individual trans people may experience this gendering of gametes as antithetical to their use in conception.

Decision Making About Parenthood

Despite the potential barriers that trans people face to foster or adoptive parenthood, it is nonetheless the case that trans people are more likely than cisgender people to be open to adoption or fostering. Moreover, trans people are more likely to be open to fostering or adopting children with physical or mental disabilities (see, e.g., Goldberg, Tornello, Farr, Smith, & Miranda, 2020). Trans people are also more likely to be open to adopting sibling groups, to adopting transracially, and to adopting LGBTQ young people. For some trans people, despite their potential associated costs (e.g., in regards to the home study and agency fees), adoption or foster care may be seen as an appealing option because they are seen as addressing issues such as overpopulation and because they offer the opportunity to provide a family to children who are unable to live with their birth family.

For some transmasculine people, pregnancy may be considered a default option, owing to both associated costs with other options and the relative ease of undertaking a pregnancy in comparison to other options such as surrogacy or adoption. This may be particularly if a pregnancy is undertaken through private arrangements (i.e., through intercourse with a partner or through the use of known donor sperm). For transmasculine people who become parents before transitioning, pregnancy may be treated as a taken-for-granted part of the adult life course, reinforced by normative gender assumptions.

It is important to acknowledge that for some trans people, parenthood is not always chosen. Transmasculine people may become pregnant as a result of sexual assault, or a pregnancy may be unintended. Furthermore, some trans people may also assume that hormone therapies suppress the ability to become pregnant, thus negatively affecting trans people's reproductive awareness and trajectories.

Early Experiences of Parenthood

Part of the transition to parenthood for trans people involves negotiating with cisgenderist stereotypes about parenthood. Such stereotypes include the assumption that only women are gestational parents, that gestational parents must experience a particular normative relationship to their pregnant bodies, that all mothers are gestational parents, and, more broadly, that all adults have an inherent desire to become parents. Some trans people actively resist these types of stereotypes, instead developing new language to describe their reproductive bodies or their roles as parents. Other trans people may adopt and/or rework existing cisgenderist stereotypes, using traditional language about reproduction in some instances and reworking it in other instances.

For transmasculine people, disclosure about being pregnant is often a key concern in regard to pregnancy. Some transmasculine people may rely upon other people's assumptions about "fat male bodies" to hide a pregnancy. Other transmasculine people may choose to disclose their pregnancy to others, so as to facilitate awareness and education. Decisions about disclosure are shaped by one's feelings of safety and the availability of support networks to help manage potentially negative responses. Disclosure is also a concern for some trans people in regard to the informational needs of children. Some trans people may choose to disclose to their children from an early age the details of their conception and birth and the gender histories of their parent(s). Other trans people may wait until their child enquires about their birth story.

As part of the transition to parenthood, some trans people experience high levels of support:

from a partner, from family, from friends, and/or from support communities. Other trans people, however, may experience additional rejection from family members, particularly when family members views trans parents negatively. Trans people increasingly face media scrutiny in the context of parenthood. Moral panics about transmasculine people and pregnancy, or transfeminine people and uterine transplants, for example, rely upon cisgenderist assumptions about reproduction and can negatively affect trans people's experiences of, and expectations about, the transition to parenthood. Media reporting can shape the decisions that trans people make about disclosing their gender history in the context of parenthood.

Chest feeding (for transmaculine people) and breastfeeding (for transfeminine people) represent key areas where trans people negotiate the transition to parenthood. Trans women may choose to induce lactation if a partner is the gestational parent, if they foster or adopt an infant, or if they have a child through a surrogacy arrangement. For transmasculine people, chest feeding can often represent a delicate balance between feelings of dysphoria and the sense that chest feeding gives purpose to the body (i.e., providing for a child). Dysphoria can relate to an individual's own sense of their body or to the (potentially negative) views of other people about pregnant bodies. Other trans people may choose to engage in milk sharing (i.e., a lactating person sharing their milk with another person for the purpose of feeding an infant), rather than feeding a child from their own body.

Whatever the decisions that trans people make about infant feeding, a significant barrier to decision making is a lack of awareness about potential options among health care providers, negative views among health care providers about trans people and infant feeding (and parenting more broadly), and a hesitancy to engage with trans people about infant feeding. As a result, trans people who face challenges with infant feeding (such as problems with milk production, problems with latching, and mastitis, a common infection associated with breastfeeding or chest feeding) may have few options for formal support. As such, informal support networks run by trans people can be an important resource for trans people engaging in infant feeding.

In terms of division of labor, trans people who are parents typically seek an egalitarian division in the context of couple relationships. Despite this, parents who make a lesser financial contribution, work fewer paid hours, and are genetically related to their child(ren) are more likely to undertake a greater share of household and childcare labor. For trans parents, undertaking a greater share of childcare has been linked to higher levels of psychological distress, and undertaking a greater share of household labor has been linked to lower levels of relationship satisfaction. As Samantha Tornello has noted, however, life satisfaction is not related to division of childcare labor. Importantly, satisfaction and distress are further related to discrepancies between the division of labor that trans parents expect will occur after the arrival of a child and the actual division of labor that occurs. As such, while an egalitarian division of labor is seen as ideal by trans parents, when this does not occur, it can negatively affect individual and couple well-being.

Parenting of Trans Children

It is important to understand trans adults' experiences and what allows them to thrive in a transphobic society. However, it is just as important to examine the experiences of trans children—and those of their parents, who often play critical roles in their development. This entry summarizes the existing literature on parenting qualities and processes that facilitate positive development for trans youth, the challenges that affirming parents of trans children face, and the resources and strengths that they access and possess across various domains.

Most of what is known about caregivers' experiences of parenting trans children comes from research with parents who are generally affirming of their children's gender identities and expressions—at least from the parents' own perspective. Research with trans individuals, however, indicates that many parents are not accepting of their children as trans. Nonaffirming parents may be less likely to volunteer to participate in studies focused on caregivers of trans children, resulting in only affirming parents constituting the bulk of the research on parenting. In addition, what constitutes "acceptance" is also complex, in that caregivers simultaneously may exhibit both affirming and nonaffirming behaviors toward trans family members and may become either more or less accepting over time.

Most studies with self-reported affirming parents of trans children have been conducted with white, middle- to upper-class caregivers, as well as with those whose children have binary trans identities. Thus, although research in this area has increased in the past decade, more studies—especially those involving parents of color, families from lower socioeconomic backgrounds, and caregivers of children with nonbinary gender identities—are needed to better understand what practices best support the well-being of trans youth.

Parents and primary caregivers of trans children may confront and be influenced by a variety of factors on the path to, and when, affirming their children's gender identities and expressions. In the United States, for example, macro-level factors at the national or state level, such as trans-relevant federal and state laws and policies, can instill confidence in, or fear of, government interventions when it comes to protections of trans individuals' rights; meso- and community-level factors, such as faith communities' and school administrations' stances toward affirming versus refusing to recognize children's trans identities and gender expressions; and micro-level factors, such as individual health care providers' understanding and acceptance of trans identities, extended family members' acceptance and rejection, and parents' own open-mindedness and transphobia.

Macro- and Community-Level Factors Influencing Parenting of Trans Children

At the broadest level, federal and state anti-trans laws, policies, and debates can have direct and indirect negative effects on trans children and their families. Some examples include the Trump administration's rescinding of the Obama administration's guidance to schools regarding accommodations for trans students, state restrictions that prohibit trans children from participating on sports teams that align with their gender, and the Trump administration's push to allow doctors and health insurance companies to discriminate against trans individuals. The patchwork systems of care and protection that exist in the United States, especially, can cause confusion and stress for families with trans children and contribute to challenges that affirming parents face when aiming to secure supportive care and accommodations for their children. The presence of laws protecting rather than limiting the rights of trans persons directly affects parents' ability to stand on legal precedent when advocating for their children's right to have their gender affirmed in school and community settings and to access information

they are entitled to about the medical options available to their children, if desired.

Community agencies, organizations, and institutions, as well as individuals in the community, can also enhance or hinder a parent's ability to affirm their trans child. Religious institutions may embrace or formally reject a trans child and their family, for example, by preventing them from becoming full members on the grounds of their religious beliefs. These actions also set a precedent for acceptance versus rejection from others in that faith community. Private and public schools may be a source of stress and hostility for parents seeking basic rights and protections for their trans children, such as access to appropriate bathrooms or locker rooms, usage of the child's correct name on official classroom rosters and in school records, and the ability to wear clothes—including school uniforms—that reflect the child's gender. Schools may also vary in how well they respond to bullying on the part of trans children's peers. Similarly, school- and community-based sports may assign children to teams based on their gender or by their assigned sex at birth, either communicating acceptance or functionally refusing trans children this common source of community.

Access to appropriate health care for trans children has also been a challenge cited by affirming parents. Appropriate education and expertise in trans-affirming care among health care providers, including front office staff who may (mis)gender trans children or use the child's legal name rather than their chosen name, can turn even routine doctor's visits into traumatic events. Likewise, when family courts lack education about the best interests of trans children in terms of ensuring supportive care, legal processes such as name changes and divorce proceedings may become highly fraught and traumatic for families instead of processes that support their health and well-being. Requests to exercise the right to a legal name may be delayed or questioned, affirming parents may be scrutinized for supporting their child's gender identity/expression, and parents may face the risk of reduced or eliminated custody due to their affirmation of their child. Intervention from the state, if not trans competent, can inflict significant trauma upon families.

Also at the macro level, the rise in media attention to trans identities in childhood may positively affect parental reactions to children's trans identities, in that having a trans child now may be less of a shock to some parents than it was for caregivers who participated in past studies exploring the experiences of parenting trans children. Even a "benign" lack of awareness on the part of parents about trans identities can prevent or delay trans children from receiving affirmation from their families and communities, including appropriate medical treatment.

Meso-Level Institutional and Community Support

Community members, such as children's teachers, local religious leaders, and sports team coaches, can all play pivotal, supportive roles in the lives of trans children and their affirming parents. Some parents of trans children have spoken about how fortunate they feel when these community members embrace them and their children and even serve as advocates for their trans children in other community domains. For example, having even one teacher or school staff person whom the trans child can seek out for help and support, in case of bullying or lack of accommodations, can greatly relieve anxiety for both trans children and their parents.

Institutional-level support, especially from children's K–12 schools and from knowledgeable physical and mental health care providers, can help relieve the anxiety associated with ongoing minority stress and stigma, as well as have an immensely positive impact on the daily lives of trans children and their parents. Knowing that a school—either formally due to explicit policies or informally due to an affirming climate—will not tolerate bullying and will uphold the rights of trans children to use their chosen name and to use the bathroom that aligns with their gender identity can take a huge burden off of trans students and their parents. Likewise, being able to readily access therapists and medical doctors who specialize in working with trans children and youth reduces the time and energy parents of trans children must expend to find appropriate care for their children. Certainly, parents of trans children today—especially those living in more remote and rural areas—might have to interact with and even provide some education to health care professionals who are not familiar

with best practices for working with or serving trans children. But increasingly, comprehensive or holistic gender clinics are emerging across the United States and around the world.

Caregivers point to online and in-person support groups as well as local and national conferences for parents and families of trans children as critically helpful to them, especially at the beginning of their journey to acceptance and when securing needed resources and services for their children and family. Finding others who are "in the same boat" and who have experienced similar joys and challenges can be an invaluable resource for parents who may have felt that they were the only ones with trans children. Some of these groups for parents also simultaneously offer opportunities for the trans children to meet as well.

Family and Other Micro/Meso-Level Factors Influencing Parenting of Trans Children

When affirming a trans child's gender identity and expression, parents may face resistance from within their own families. Affirming parents may be "on a different page" than spouses, partners, and coparents, who may be slower to accept the child as trans or who remain steadfast in their rejection. Affirming parents may work to "win over" the child's other parent or may scale back their own affirmation for fear of conflict with the child's other parent. Affirming parents who share legal or physical custody of their trans child with a coparent may struggle to create or alter parenting plans that adequately affirm their child's gender identity or expression. In some cases, trans children may find themselves moving between parental households that provide different degrees of gender affirmation. Some affirming parents have found family courts to be helpful in ensuring that their trans children receive appropriate care and support, while others have had their custody reduced or taken away altogether, often due to courts' lack of familiarity with trans issues. Similarly, some siblings of trans children serve as important allies, while others may resist affirmation of, or resent, their trans sibling.

The family field is ripe for more research on the roles and relationships among family members of trans children and their parents, especially siblings, stepparents, and extended family members. Aunts, uncles, cousins, and grandparents—like siblings—can play important, affirming roles in a trans child's life or can serve as impediments to greater familial acceptance. Affirming parents have sometimes chosen to cut ties with nonaffirming family members in order to protect a trans child from overtly rejecting behaviors on the part of extended family, such as refusing to use a child's correct name or pronouns, intentionally buying the child gifts or clothes deemed stereotypical for a child of a different gender, or for religious abuse such as telling a child that "God won't love you" or that they will go to hell if they transition. Nonaffirming family members have been known to report affirming parents of trans children to Child Protective Services (CPS), claiming that affirmation of a child as trans is akin to abuse and illustrating how nonaffirming family members can try to tap into the power of the state to exercise their will over trans children. Such threats are so common that affirming parents are often advised by trans advocacy groups to preemptively create a "safe folder" documenting a child's authentic gender over time and containing statements from health care providers, teachers, and other respected individuals and professionals who can verify the child's authentic gender and the affirming parents' appropriate parenting approach.

Supportive Family and Friends

Close family members and friends who are accepting of a child as trans can be key sources of support for trans children and affirming parents as they navigate their communities. Some studies with mothers of trans children have reported that fathers seem slower to acceptance than mothers—but certainly there are fathers who are just as, or more, affirming than mothers. Trans children's siblings, aunts, uncles, cousins, and grandparents can play important, affirming roles in their lives, especially when their parents are rejecting, by providing critical support for parents' affirmation of their trans children. One affirming mother was quoted as saying that her extended family—especially her child's grandparents—was her "number one" source of support: "I don't know that I could've done this . . . by myself." Grandparents in particular have received some attention in the trans extended family literature,

especially when they step in as primary caregivers of their trans grandchildren.

Many affirming parents will write a "coming-out" letter to family and friends to inform them of the child's gender and of any changes (e.g., name, pronouns) that others should be aware of, acknowledge, and use. After sending the letter or otherwise coming out to others, parents have reported losing some friends and family while also learning who their strongest and closest allies are and will be as they move forward with a child's social transition. There have been reports of parents sometimes being happily surprised to receive positive responses from older or religious relatives and friends whom the parents expected to be rejecting.

Parents' Paths to Acceptance

Parents of trans children have described their own "journeys to acceptance," whereby initially they did not realize that their children were or even could be trans, and thus their acceptance came about over time. Some research has examined how children's other identities may affect parents' understanding or affirmation of their children as trans. For example, in one exploratory study, parents of trans children with co-occurring autism spectrum disorder (ASD) diagnoses described their child's intersecting ASD and trans identities as being challenging to disentangle from one another and complicating their understanding of their children's gender. Other research has reported how sexual minority parents might initially reject their children's gender identities and expressions out of fear of scrutiny or blame from others who might assume that the parents' sexual orientations "caused" their children's gender nonconformity.

On the road to acceptance, some parents described their own efforts to curb or police their trans children's gender expressions, such as telling children that they are mistaken when they assert their gender or not allowing children to dress in desired clothing or to choose certain toys. Furthermore, some parents have described feelings of sadness and of mourning the "loss" of their imagined son or daughter, indicating parents' own gender assumptions or "stories" in relation to their children, which served as barriers to acceptance. Other parents, however, have described a feeling of relief or clarity once they realized that their children were trans, in that they finally understood what was happening with their children and could search for resources and supports for their families.

Concern and anxiety are commonly reported by affirming parents of trans children, who worry about future decisions (e.g., whether their child will take puberty blockers with the onset of puberty) and struggles their children may face in regard to, for example, physical transition and romantic relationships. In particular, many parents of trans children fear for their children's physical safety in a world that can be ignorant about and violent toward trans individuals.

Parent-Level Strengths and Resources

Being open-minded has been cited by affirming parents as helping them move toward acceptance more readily, as has being willing to listen to their trans child. Many parents talk about "a light that goes on" in their children after they are able to express their gender freely and authentically—at least one mother has described it as her child "being given wings." Caregivers being educated about, or having experience with, trans individuals has also been noted as a strength and facilitator of acceptance of a trans child. Although research has revealed that the heterosexism and stigma directed at LGBTQIA+ parents can make it initially difficult to accept a trans child due to, for example, worries about scrutiny, other sexual minority parents have cited their own experiences of feeling "different" or being discriminated against in relation to their sexuality as reasons for why they readily accepted their child as trans. Having economic resources and racial privileges also likely play roles in helping upper-income and white parents find and access resources and when aiming to influence their children's schools and others in the community to accept their children as trans. Furthermore, being established and known in one's community as a "good parent" or having strong, already existing community connections has been cited as a primary reason why some affirming parents might have had a relatively easy time convincing others that their children were "truly trans" and deserving of acceptance and support.

Studies have reported that affirming parents can become strong advocates in their communities for their children and other trans youth by, for

example, educating administrators and teachers in their children's schools and insisting their children's rights be protected. Some affirming parents may, in fact, find a new voice and purpose, as well as a new identity as a trans advocate. Importantly, however, not all trans children may want their parents to be vocal advocates for trans issues in their communities or thereby potentially outed continually to others. Some trans children may want to be "stealth" and may not even identify as "trans." Thus, affirming parents may have to balance their own newfound identities as a "parent of a trans child" with their children's privacy. That said, many affirming parents of trans children and youth have been pioneers, co-leading with their children in what has been referred to as a "gender revolution" and helping to pave the way and reduce obstacles for the many families with trans children coming after them.

Trans Children as Sources of Strength and Growth for Their Parents and Families

Most research has focused on the critical role that familial (namely, parental) acceptance plays in positive outcomes for trans children and youth. Affirming parents of trans children, however, have been quick to correct others who tell them that their children are lucky to have them. These parents have spoken about the positive ways that their trans children have affected them and their families. Some say that their children have given them a gift; the children had opened their parents' eyes, hearts, and minds to the beauty of diversity and what it means to truly love and accept a child. These parents speak about their own growth as human beings and often deflect praise for simply doing what they were supposed to do as parents—to love, nurture, and care for their children as best they can. Despite a focus on the transition that a trans child may undergo to express their authentic selves, it is often those around the child who undergo true transitions, as families and communities expand their previously limited conceptualizations of gender and move to recognize, embrace, and celebrate a greater understanding of human diversity.

Parents of Trans Children and Youth, Custodial Issues

Parents who support their trans children and adolescents (i.e., affirming parents) may experience custodial issues, including custody disputes with nonaffirming parents and involvement of Child Protective Services (CPS), if their supportive parenting approach is deemed "abusive" by extended family or community members. A growing body of social science and legal literatures provides insight into custodial-related challenges faced by some affirming caregivers of trans children and youth. This literature can inform family courts that are applying the "best interests standard" to cases involving trans children and adolescents. This entry summarizes what is known about child custody disputes involving trans children and adolescents, including cases involving affirming and nonaffirming parents, as well as grandparents as affirming caregivers and legal guardians of their trans grandchildren. It also addresses other custodial issues, such as CPS involvement or threat of involvement. Finally, this entry discusses the role of advocacy groups in raising awareness, educating family court professionals, and providing support to affirming parents and their trans children.

Custody Disputes Between Affirming and Nonaffirming Parents

Media Attention

Child custody disputes between affirming and nonaffirming parents of trans children and adolescents have received increased attention in mainstream media. In October 2019, for example, the national media covered a custody case in Texas when a jury recommended that an affirming mother of a 7-year-old trans girl be awarded full custody over a nonaffirming father. Following this recommendation, U.S. Senator Ted Cruz and other political figures took to social media to perpetuate the father's misleading claims that the mother intended to force the child to undergo medical interventions. Consequently, the judge in the case ultimately disregarded the jury's recommendation and awarded joint custody to the parents, expressly giving the father equal legal authority in medical decision making for the child. In April 2019, the Arizona Supreme Court weighed in on a custody case involving a trans child, where a nonaffirming father had been awarded sole legal custody over an affirming mother but where the family court judge also required that the child see a gender therapist. An appellate court later ruled that the family court judge had overstepped by requiring therapy, but the higher court disagreed with that aspect of the appellate ruling. The state's high court found that a family court judge can order treatment, including therapy and other expert intervention, for a trans

child even when a nonaffirming parent does not consent, if the child is at risk for physical or significant emotional harm.

Cases Highlighted in Legal Journals

Other high-conflict custody cases involving trans children have been summarized in legal review articles. In three of five documented appellate court cases with decisions handed down between 1998 and 2012, affirming mothers lost custody of their children or had their parenting time or legal decision-making authority reduced. A fourth case decided in 2009 resulted in shared physical and legal custody between the affirming mother and nonaffirming father; the fifth, handed down in 2014, ended with the affirming father receiving sole legal custody and primary physical custody over the nonaffirming and physically abusive mother. Text from these legal decisions indicates that family courts have historically been unfamiliar with trans identities in childhood and experts' recommendations for promoting the health and well-being of trans children and youth and, in some cases, draw upon cisnormative and transphobic beliefs when deciding what is in the best interests of trans children and adolescents.

Recommendations of Legal Experts

Given that many family court professionals still lack familiarity with trans identities in childhood, legal experts have advised affirming coparents of trans youth to avoid court whenever possible. Asaf Orr is senior staff attorney and director of the Transgender Youth Project at the National Center for Lesbian Rights. Orr has noted that, increasingly, there have been successes in family court for affirming parents of trans children, as awareness grows of the importance of affirmative models of care and expert opinion about what is in the best interests of trans youth. That said, Orr and other experts recommend proceeding with caution and moving slowly when taking steps to affirm trans children's gender identities and expressions, as well as engaging in dialogue with nonaffirming coparents when possible, with the hope of ultimately gaining the nonaffirming coparent's consent prior to proceeding with social transition. If going to court becomes necessary, then experts recommend that affirming coparents and their attorneys seek out, follow, and document the advice of expert mental health and medical professionals.

Social Science Research

Beyond the accounts of custody cases in law review articles and the media, little is known about the family court–related experiences of affirming parents of trans youth who disagree with their children's other parent(s) about how to approach the child's gender identity or expression. One 2019 study by Katherine A. Kuvalanka and colleagues, entitled "An Exploratory Study of Custody Challenges Experienced by Affirming Mothers of Transgender and Gender-Nonconforming Children" and published in *Family Court Review,* explicitly set out to examine the experiences of 10 affirming mothers (9 were white, 8 had a college degree, and 3 had female ex-partners) who had experienced custody-related challenges involving their trans children (7 of the 10 children were assigned male at birth). Seven of these 10 mothers had their custody cases decided in court, four of which resulted in the mothers losing, or having a reduction in, custody. Two of the seven ended in shared custody decisions, and one mother was awarded sole custody. The three other mothers, who did not go to court, had shared or sole custody of their children.

All 10 of the mothers said that their ex-partners "blamed" them for causing the children's gender nonconformity or trans identities. Several of the mothers also described coercive behavior on the part of ex-partners toward the children—sometimes in the form of identity-related abuse (e.g., forcing the child to cut their hair, taking away toys stereotypically for a certain gender, and refusing to use the child's chosen name or pronouns). Some mothers described coercive behavior by ex-partners toward the mothers that was akin to emotional and psychological abuse; for example, some ex-partners were reportedly using the courts (e.g., repeatedly filing or threatening to file contempt of court charges) to continue a pattern of abusive behavior to control and hurt the mothers while also obstructing affirmation of the child's gender. Some of the mothers in the study also described facing cisnormative and transphobic attitudes and beliefs on the part of family court professionals. For example, one mother of a trans girl said that

she received a court order signed by the judge requiring that the mother only allow the child to wear gender-neutral or boys' clothing.

According to the mothers, these custody-related challenges had a negative impact on both themselves and their children. Beyond the reported emotional and psychological toll on the mothers, such as feeling depressed and overwhelmed, there was also a financial toll experienced by half of them due to costly legal challenges. Nearly all of the mothers described negative implications for the children, sometimes resulting from having to live part-time in a nonaffirming household. Four of the mothers described disturbing behavioral and physical behaviors exhibited by their children, including acting out, loss of appetite or sleep, and suicidal ideations.

Last, 9 of the 10 mothers spoke about what they felt was a critical need for access to adequate resources. Several spoke about the importance of having adequate financial means to retain attorneys and contest court challenges. Some of the mothers noted that having or not having money was a major factor in keeping or losing their children. And more than half of the mothers talked about the importance of, and a need for, better-educated and unbiased family court professionals, including attorneys, judges, guardians ad litem, and custody evaluators, so that affirming parents of trans children have a more level playing field in family court rooms.

As with most research on affirming parents of trans youth, existing studies in this area are limited to the experiences of mostly white, college-educated, able-bodied, heterosexual mothers in the United States. Given that high-conflict custody disputes are costly, custody cases that go to court likely involve at least one caregiver with financial resources; unknown is how parenting disagreements play out among parents of trans children from lower socioeconomic statuses. Furthermore, Kuvalanka and colleagues suggested the presence of underlying misogyny in both custody challenges and decisions, given that most documented cases involve mothers of trans girls who have been sued for custody.

Affirming Grandparents as Legal Guardians

Grandparents can be important allies to their trans grandchildren and may take over as legal guardians. Parents generally have stronger legal standing in regard to their children than do the children's grandparents. Yet, the few cases highlighted in the media and in social science research have shown affirming grandparents to have gained custodial rights to their trans grandchildren over nonaffirming parents. National media attention was given in 2018 to an Ohio family court case in which a judge awarded custody of a trans teenager to the affirming grandparents over the nonaffirming parents. In that case, the parents had prevented the teenager from accessing gender-affirmative care, leading the youth to be suicidal. In addition to media attention, a handful of individual cases of grandparents who had legal guardianship of their trans grandchildren due to parental neglect and other such reasons have been documented in scholarly works.

Some affirming grandparents have found that gaining legal decision-making authority in regard to their trans grandchildren can be of critical importance. For example, if parents are against their children receiving gender-affirmative medical intervention, then securing legal custody may be necessary for accessing gender-affirmative treatments for trans grandchildren. Legal guardianship, however, has limitations; in some states, for example, legal guardians are not be able to secure a legal name change for a trans child without the consent of both parents. Some affirming grandparents may face transphobic bias in the courts. In one case, even though the judge did not stand in the way of the transfer of guardianship, she made her disapproval of the grandparents' affirmation of their grandchild known. Other affirming grandparents, however, encounter judges who are knowledgeable about trans identities and the complexities of gender.

CPS Involvement When Parents Affirm Their Trans Children

Affirming caregivers of trans children can face threats to custody from sources other than a child's nonaffirming parent. Extended family members, neighbors, school personnel, and other community members who disapprove of an affirming approach and deem affirmation as "abusive" have been known to reach out to CPS to report affirming parents. Trans advocacy organizations advise affirming parents to prepare for such a possibility by creating a "safe folder" containing documents that attest to the child's gender identity

and expression, their good parenting, and other evidence that could help defend an affirming parent's affirmative approach in court. Safe folders often include letters from medical and mental health professionals, supportive teachers and other community members, and photos of the child that reflect the child's social transition. Affirming parents who have recounted their experiences interacting with CPS workers describe the fear that both they and their trans children felt at the prospect of the state having the ability to remove the child from the home. Fortunately, most accounts have described CPS workers who either were knowledgeable about trans identities in childhood or recognized that the parents were acting in the best interests of the child and should not have their parental rights challenged.

The Role of Advocacy Groups

Advocacy groups play a critical role as parents grapple with custodial issues pertaining to their trans children. The missions of these advocacy groups generally focus on financial resources and individual support for affirming parents, education of family court professionals, collation of state and national resources, research, and advocacy efforts with other LGBTQIA+ organizations. The Transgender Children's Legal Defense Fund in Ohio is one such advocacy group that strives to give affirming parents the support they need to ensure that their children can live free from the oppression of nonaffirming parents. The National Center for Lesbian Rights provides guidance to attorneys of affirming parents and secures funds for expert witness fees. Mothers in Transition, founded in 2013 in Arizona, seeks to tip the scales of justice toward affirming parents in family court cases throughout the United States through individual support, legal education, advocacy, and research. Until greater awareness and acceptance are achieved, advocacy groups play a unique and necessary role in educating legal decision makers regarding the best interests of trans children.

Parents of Trans Children and Youth, Relationship Issues

Parents of trans children and youth play a pivotal role in their children's well-being. The nature of these parent–child relationships is especially critical for trans children and youth who are more likely to experience hardships both at school and at home due to living in a cisnormative culture. Trans youth and children who experience rejection from their families, especially from parents, are more likely to internalize those messages and have lower self-esteem. Conversely, those who feel loved and affirmed by their families are more likely to feel as though they have value and self-worth.

Many trans children and youth voice a desire to communicate more openly with their parents and

wish for closer and more supportive relationships with them. However, even children who believe their parent will be accepting may struggle to engage in a challenging and personal conversation about gender. For example, fear of rejection from parents can be a barrier to disclosure of trans identity. However, such concealment may have negative consequences. Trans children and youth who hide their gender identity often experience anxiety and/or depressive symptoms, leading to further distance in the parent–child relationship.

A popular narrative about trans children involves a negative gender identity disclosure experience with parents who immediately chastise them or act in rejecting ways. Researchers have found that there are multiple ways that parents respond to their child's disclosure, ranging from acceptance to rejection, and that those who respond negatively can change over time. Some parents experience cisnormative grief, when they feel a sense of loss after their child discloses their trans identity. This is due to cisnormative expectations they hold for their child. Consider a father who expresses his disappointment that he will not get to walk his little girl down the aisle after that child discloses that they identify as transmasculine. This example includes many gendered assumptions based on social rites of passage and expectations, although none are related to who the child is as a person. Gendered social norms inform a given parent's belief system and may take into account their present and ongoing parent–child relationship when they are experiencing cisnormative grief. Relationships between parents and trans children are best cared for when parents choose appropriate outlets to process their feelings, such as with a therapist, and do not burden their child with adult concerns.

Parents who struggle with understanding gender identity may exhibit subtle forms of rejection, which can include pressuring the child to conform to cisgender norms, refusing to use the child's pronouns or chosen name, becoming visibly upset or tearful in the presence of the child, or maintaining secrecy about the child's gender identity. Parents who demonstrate overt rejecting behaviors may contribute to more serious negative consequences for those trans children who choose to disclose or whose parents discover their gender identity. Trans children and youth who experience outright rejection from a parent are more likely to become distanced and engage in risky behaviors. Rejecting behaviors are especially dangerous for trans youth and children when parents are physically or verbally abusive, use religious condemnation and shame, prevent the child from seeing friends or engaging in social activities, or exclude the child from family activities. The range of rejecting behaviors can contribute to trans children feeling as though there is something wrong with them and diminished a sense of trust. These experiences contribute to high rates of substance use, mental health concerns, and suicidality among trans children and youth.

Conversely, parents who support their trans children tend to have positive relationships with their children. Supportive and positive parent–child relationships lead to decreased risk factors for youth and also contribute to meaningful experiences for parents. There are an increasing number and range of resources for parents to learn about gender identity and ways to support their trans children and youth. As cisgender (cis) parents become educated about gender identities, they can learn to anticipate the developmental needs of their trans child and seek out appropriate resources for them. Parents who are aware of their child's needs, ask their child questions, and advocate for their child at school and in medical settings are more likely to establish open communication with that child. This creates opportunities to address sexual health with youth as well as other risk concerns. These parents are also more likely to become a safe adult for their child's trans friends.

Supportive parents may also become involved in advocacy efforts and increase their awareness of social justice issues, such as political initiatives to prevent bathroom usage or medical support for trans children. When parents support their trans children by seeking out support groups, this may ultimately open doors for connection with other supportive families. For instance, parents may seek out support groups or camps for families with trans youth, where they meet other parents who are facing similar issues and are able to normalize and understand each other. These parents are able to learn more about their child's needs and experiences through relationships with other families and engagement in advocacy efforts, which can

lead to deepening and more authentic relationships with their child.

Parents do not always agree or maintain a shared understanding of their child's gender identity. In a two-parent family or stepparent family, parents may vary in their understanding, acceptance, or rejection of the trans child's gender identity. They may be in conflict about ways to support or not support a trans child. These circumstances can be especially challenging for children whose parents do not reside together, resulting in a supportive relationship with one parent and a rejecting relationship with the other parent. Legal custody orders that require a child to spend time in each home can further complicate their relationship with parents. A trans child and a supportive parent may feel an alliance in two-parent families with a less accepting or rejecting parent who resides in the same house. Children may feel an increased sense of responsibility or blame if they witness conflict between parents that is related to disagreements about parenting a trans child.

Partners of Trans People

In the context of relationships, *partners of trans people* refers to those who share an intimate, romantic, and/or sexual relationship with a trans person. Partners of trans people may be coresidential with their partners or not and may be connected to their partners legally through marriage or domestic partnership or not. Partners of trans people often report engaging in strategies that center and affirm accurate recognition of their trans partner's gender as a reflection of their commitments to gender self-determination, to provide support, and to build intimacy in their partnerships. For example, an individual who is a partner of a transgender man who menstruates might purchase their trans partner's menstrual supplies and refer to their menstrual cycle using language that is gender neutral or even masculine. Partners of trans people may be cis or trans themselves, and these gender identities may also shift over time. Some trans people report greater acceptance from partners who are also trans as cis partners may be more likely to attempt stalling or blocking a trans partner's transition (especially for those coming out as trans women) or seek to maintain their own binary notions of sex, gender, and sexualities. With these factors in mind, this entry discusses partners of trans people and the various negotiations that cis and trans people may undertake as their identities and relationships continue to evolve over time or end.

Navigating Gender and Sexual Identity Shifts

Gender and sexual identities can shift over time for both trans people and their partners. Consider how many sexual identities (e.g., gay/lesbian/bisexual/straight) are always dependent on the sex and gender identities of each person in relation to the other. Linguistically, heterosexuality, bisexuality, and homosexuality, for example, have no inherent meaning outside of the concepts of binary sex categorization and gender identity (as female or male, woman or man, etc.). To be able to self-identify using one of these sexual categories, one must articulate one's own sex category or gender identity in relation to another person's sex category or gender identity. *Homosexuality* implies sameness of sex categorization or gender identity between oneself and one's

romantic and sexual interests or partners while *heterosexuality* implies difference. These binary sexual identity categories are particularly unintelligible in the context of nonbinary gender identities. It also makes sense, then, that as one's own or one's partner's sex categorization and/or gender identity shifts, their sexual identity may shift as well. As such, trans people and their partners may be more likely to identify as pansexual, queer, or asexual. There is also evidence that these self-identification terms are being stretched beyond their original linguistic origins, with some self-identified bisexual individuals, for example, asserting that this category, in social practice, expands beyond more limited and binary definitions. None of these categorizations are "natural," per se; rather, they rely upon human social construction for how people understand their own and others' desires and interactions.

Sexual identity, itself, is a relatively recent social phenomenon. Prior to the late 19th century, people engaged in all sorts of sexual behaviors with people aligned with their own sex categorization as well as those not aligned with it. However, they did not think of such behaviors as dictating a type of personhood. Terms like *heterosexual* and *homosexual* were later inventions, which sought to define people by their romantic and sexual attractions and behaviors. Important to note, the term and concept of *heterosexual* was not even invented until after the invention of the term and concept of *homosexual,* revealing how terms and concepts are often constructed as part of establishing insider and outsider status rather than describing any sort of natural features of individuals themselves.

Some trans people who identify as heterosexual prior to transition may find that their partnerships are experienced personally, interpersonally, and socially in different ways depending on how their gender is recognized or misrecognized by others. For example, if a trans woman is partnered with a cisgender (cis) woman in a heterosexual relationship prior to her transition, this same relationship may be experienced by the couple and/or others as lesbian, bisexual, or pansexual at a later point in time. It is also important to note that there may be differences in how a trans person, their partner, and others outside their relationship recognize this partnership and each person's relationship to the other. When these forms of recognition do not align, individuals may feel considerable stress. For example, if a person partnered with a cisgender man transitions toward nonbinary, and the cis man previously understood his relationship as heterosexual, his partner's transition toward nonbinary may be challenging for him if he does not conceive of himself as a gay, bisexual, pansexual, or queer man. In such instances, relationship stress and dissolution may occur or become more likely. Some trans people and their partners report shifting from monogamy to polyamory in order to accommodate desires for sexual exploration that may emerge as one or both partners transition. Others report developing asexual romantic relationships in these contexts. It is not always the case that prompts to reconsider one's sexual identity in relation to a transitioning partner's gender identity are resisted or refused. In many instances, a partner's transition may open up opportunities for individuals to consider potential shifts in their own gender and/or sexual identity or the type of sexual relationship they have together.

As with cis people, trans people hold sexual self-identifications in various combinations across the spectrum, which include, but are not limited to, straight, gay, lesbian, bisexual, pansexual, queer, and asexual. As with cis people and their partnerships, trans people and their partnerships may be sexual or asexual and monogamous or polyamorous, and these relationship patterns and types may also shift over time. Cis people who misrecognize a trans person's gender identity are likely to misrecognize that person's sexual identity as well. For example, if a cisgender person misrecognizes a trans woman as a man, then it is likely that that trans woman in a relationship with a cisgender man may be misperceived as being in a gay or bisexual (rather than heterosexual) relationship. This is also a form of cisnormativity, or assuming that cis gender and sexual identities and relationships are natural and superior to those involving trans people. Some trans people in partnerships with other trans people report frequent misrecognition of both their gender and sexual identities by others, with some of this misrecognition expressed in intentional ways or even through hostility and violence.

Embodied Changes

Whether a transition is medically facilitated or not, transition often, but not always, involves shifts in physical embodiments. Such shifts may include but

are not limited to the sorts of clothes a person wears; one's hairstyle; the way that a person sits, walks, and interacts with others; the pitch of one's voice; whether or not they menstruate; how one's body reacts to sexual stimulation; the shape of one's body; and facial and body hair. These embodied shifts may affect sexual and nonsexual interactions between partners, particularly considering how romantic and sexual relationships tend to be highly inflected and informed by gender and gendered social scripts. Furthermore, these gendered social scripts are often deeply internalized and carry an emotional valence. People do not just know what it means to be sexy, desired, or desirable; people also feel what these mean in very gendered ways. Butch/femme lesbian relationships serve as one example of how gendered sexuality is not at all dependent on sex categorization. Another example may be found in trans women's greater tendency to find a wider variety of body sizes and types sexy rather than conforming to societal standards for beauty in self-presentation or its role in interpersonal attraction. Gender and gendered scripts and interactions are often eroticized in patterned ways. Trans people and their partners may also find that their relationship dynamics and romantic/sexual practices might shift along with shifts in how their or their partner's gender is (mis) recognized by others. If individuals are frequently misgendered by others, they may find themselves less comfortable engaging in sexual and nonsexual behavior or interactions that are gendered in particular ways (e.g., being a "top"/dominant, "bottom"/ submissive, or "switch"/versatile in sexual interactions; engaging in forms of household labor such as cooking or taking out the garbage).

These shifts often necessitate enhanced communication among partners about needs and desires around how they interact in sexual and nonsexual ways in both public and private spaces. For example, trans people may call upon a partner to assist them in engaging with the public when doing so is likely to result in being misgendered (such as a cisgender woman partner making and/or attending an appointment for gynecological care for their trans man partner or purchasing clothing for their trans woman partner). Trans people and their partners may also experience shifts in acceptable or desired sexual and nonsexual touching practices. How couples walk arm in arm, open doors for one another, and dance are often gendered. Body parts, too, are gendered in our culture. Parts of the body that may have been sexually responsive or unresponsive and part or not part of earlier sexual interactions may become unresponsive, responsive, not part of, or part of sexual interactions as gender and sexual identities shift. Again, these shifts require ongoing, sensitive communication between partners to ensure that sexual and nonsexual touch and physical interactions are both enjoyable and consensual. Of course, it is important to note that this is also true for cis individuals and partnerships and that the insights and strengths that some trans people and their partners develop may be considered exemplars for effective and empathic relationship communication, useful in their application by cis people and within cis partnerships.

Violence

Although many trans people report positive relationship experiences, especially with other trans people, trans people are also at high risk for intimate partner violence (IPV) due to cisnormative and transmisogynist assumptions in contemporary society. Specifically, trans people experience and report high levels of rape and sexual assault, domestic abuse, and physical violence from (especially cisgender) partners and beyond relationships. Research shows that partners of trans people may undermine their gender and sexual desires and that these endeavors often lead to more intense forms of physical and emotional violence over time. In fact, even clinical discussion of trans experiences with IPV often engages in victim blaming by suggesting trans people lack normative problem-solving and communication skills in comparison to cis abusers. Researchers have also demonstrated much higher risk for experiencing violence in public, and in the process of dating, among trans women and particularly so for trans women of color.

Researchers have documented physical and emotional abuse that trans people experience from medical, psychological, and criminal justice agents, experiences that are also associated with negative health outcomes and IPV. Black, Latinx, and indigenous trans people are particularly susceptible to violence, mistreatment, and surveillance by and within the criminal justice system. Abuse narratives

of trans people, especially trans women and trans women of color, demonstrate pervasive transmisogyny (or antagonism toward trans womanhood) in interpersonal, romantic, sexual, professional, and institutional domains throughout society. Even in scholarship, for example, researchers have noted the tendency for studies to focus on, prioritize, and elevate trans men and others assigned female at birth, while trans women in academia and studies of trans women receive significantly less attention and more hostile reactions. Understanding and reporting on violence against trans people, particularly that disproportionately experienced by trans people of color, are requisite for understanding relationships between gender and violence more broadly. Furthermore, the impacts on relationships of experiencing chronic systemic violence, as well as the links between experiences of systemic and interpersonal violence, deserve further research exploration.

Negotiating Relationships

Because of cisnormativity and systemic discrimination against trans people, especially trans women and trans people of color, the stakes for trans people and their partners negotiating their identities and partnerships are often quite high. The additional work in which trans people and their partners engage to ensure that trans people are not misgendered and mistreated is generally invisible labor. Furthermore, partners of trans people may take on additional emotion work and caregiving labor to support and validate their partners and partnerships. This may include, but is not limited to, providing medical care and material, physical, and emotional support for partners undergoing medically facilitated transition through pharmaceutical and/or surgical treatments (and navigating bureaucratic systems connected to insurance); marking important moments during transition through documentation and organizing celebrations; negotiating relationships with one's own and one's partner's families to help them better understand and process a partner's transition; and serving as an advocate, educator, and ally when in social and public interactions. By the same token, trans people may have to take on additional emotion work and caregiving labor to support cis partners. This may include, but is not limited to, educating cis partners about sex, gender, bodies, language, and even medical needs and requirements; navigating cis assumptions as well as monosexual assumptions embedded in the gendered sexual performances of gay, lesbian, and straight partners; and surviving ignorance or abuse from partners unfamiliar with or harboring negative opinions about trans people and experiences.

Furthermore, early requirements for accessing medically facilitated transition often required trans people to conform to restrictive understandings of gender and sexual identities—such as maintaining at least the impression of rigid and binary gender identities and heterosexual sexual identities when meeting with health care professionals who often serve as gatekeepers to needed resources. Decades of resistance and trans advocacy for self-determination, however, have resulted in broader ability for trans people to hold gender and sexual identities and partnerships that transcend binaries. Increasingly, trans people are forming partnerships and broader families of choice with one another. This offers enhanced opportunities for trans people to develop partnerships with those who have shared backgrounds, communities, and experiences that may facilitate enhanced understanding and communication. Given systemic oppression and discrimination against trans people, however, it is particularly important for trans people in partnerships with one another to receive informed, ethical, and competent support, grounded in trans self-determination, from their families, friends, communities, and various social systems including, but not limited to, employers, fellow employees, and care providers.

Phenomenology

Phenomenology is a philosophical method that examines the structures of human consciousness in order to describe how phenomena take place in space and time. Phenomenology explores how the world manifests to us through our senses and how we come to collectively agree on what makes phenomena recognizable and distinct. These concerns make phenomenology valuable to Transgender Studies, which analyzes how gendered phenomena are expressed and perceived. This entry examines areas of methodological and theoretical overlap between these two fields.

Defining Phenomenology

Broadly speaking, phenomenology investigates how the world appears to us and how our consciousness meshes with sensory environments to construct temporality, spatiality, memory, and affect, as well as perceptible objects and events. As a philosophical method, it does not treat objects in the world or the world itself as objectively given but rather asks how the world and the objects in it come into consciousness through sensory and affective engagement. The field was pioneered by German philosophers Georg W. F. Hegel (1770–1831), Edmund Husserl (1859–1938), and Martin Heidegger (1889–1976) and has been expanded by many other theorists, most notably French thinkers Maurice Merleau-Ponty (1908–1961) and Emmanuel Levinas (1906–1995). Unlike some other branches of philosophy, phenomenology is not a school of beliefs and has no principal doctrines; rather, it is a style of thought that is practiced through investigating lived experience, in which the body and the senses play an important subjective role in the determination of truth.

Phenomenology represents a significant break from the rationalism that has dominated Western philosophical thought since Plato, in which an inaccessible and universal "Truth" is theorized to exist outside of and independently from the body and the consciousness. Instead, phenomenology seeks to offer an objective study of things normally presumed to be subjective—judgments, perceptions, and emotions—in order to arrive at the lived truth of the subject's experience. It therefore favors

a practice of reflective attentiveness to the operations of consciousness itself, with the ultimate goal of understanding how various sensory experiences of something are integrated into a consistently encountered object or event. Phenomenology therefore resists a major presumption of the Western philosophical tradition, in which what can be rationally proven is valued over what is subjectively felt.

Although phenomenology enforces no central set of claims, what makes it philosophically distinct is its departure from Cartesian dualism, in which the mind and body are split, subjects and objects are metaphysically separate, and subjectivity is determined by one's very separation from the object one perceives. By contrast, phenomenological methods treat the mind, body, subject, and object as an entanglement, viewing consciousness as created through the encounter with the world. For a phenomenologist, consciousness is therefore not in the mind but in the sensory encounter *between* the mind and the object, produced by the manner in which our senses stretch out to engage objects, memories, or ideas. Consciousness is only ever consciousness *of something,* meaning that the subject cannot precede the object that is perceived.

Phenomenology and Transgender Experience

Although phenomenology has generally explored more abstract questions of how phenomena are constituted within singular and collective consciousness, its core interventions have proven useful to theorists seeking to describe their embodied experiences of difference. Because it emerged as a resistance to philosophy's tendency to posit universal systems of meaning, phenomenology has been valuable to poststructuralist fields—such as feminism, critical race theory, queer theory, and Transgender Studies—that have challenged the master narratives of Western culture. For example, existentialist feminist Simone de Beauvoir's 1947 work *The Ethics of Ambiguity* draws on phenomenological methods to insist that humans are simultaneously free and yet also objects for others, while political philosopher Frantz Fanon's 1952 work *Black Skin, White Masks* displays a phenomenological attentiveness to the lived experience of racialization. Similarly, Sara Ahmed's 2006 book *Queer Phenomenology* illustrates how sexual orientation is structured as a set of "straight" spatial relations, in which queer desire is experienced as a turning "off line" that seeks to put forbidden objects within reach. These uses of phenomenological method point to the ways in which Western culture has been constructed for an implicitly male, white, and heterosexual subject.

Of these poststructuralist fields, however, it is perhaps Transgender Studies that has most effectively taken up phenomenology to explore how gender is subjectively sensed, socially perceived, and collectively constituted. The animating concerns of phenomenological inquiry—such as how phenomena are agreed upon as recognizable objects or the importance of subjective experience to the determination of truth—have been useful to transgender theorists seeking an account of gender that accommodates transgender experience. Because it treats phenomena as constituted by and through consciousness rather than as external facts, phenomenology has been useful in analyzing how the objects "man" and "woman" come to be collectively agreed on as distinct and recognizable things. In Western culture, gender is typically understood to be a symbolic reflection of the sexed body, a Platonic relation in which gender points back to an unquestionable truth rooted in nature. This account of gender is widely enforced by medicine and law, which use the evidence of sexed embodiment to make and enforce gender attribution.

Transgender Studies arose at least partially out of a need to develop new theories for why transgender people sense gender differently—not as determined by the sex of the body but instead by sensations and emotions. Phenomenological methods treat subjectively experienced sensation as fundamental to knowledge, rather than as separate from the mind or reason. According to phenomenology, the body's meaning is not simply defined by what others perceive but also by what the subject *feels*. Therefore, the gender I am is the gender *I feel myself to be*—the gender that my senses makes real to me. Because it insists on the importance of embodied sensation over rationalist determinations of "truth," phenomenology has been useful in challenging medical and legal authority over gender attribution.

Phenomenology in Transgender Studies

Transgender Studies' original motives were highly compatible with phenomenological methods: In the early 1990s, transgender scholars seized authority to speak about their subjective experiences of gender over the medical and psychiatric institutions that had historically labeled them as "psychopathic" and "disordered." Transgender Studies' attention to lived transgender experience, rather than to the medical discourses that had pathologized transsexuality and transgenderism, made the early field highly congruent with phenomenological inquiry. In 1998, two key scholarly works formalized the use of phenomenological method in Transgender Studies. The first, Jay Prosser's *Second Skins: The Body Narratives of Transsexuality,* examines the narrative patterns through which transgender subjects relate our identities, claiming that these patterns communicate how transsexuality is experienced at the material level of the body's felt sense. Prosser explains the physical experience of transsexuality as the embodied feeling of literally having the "wrong body." This allows him to argue that transgender embodiment is experienced in ways that depart significantly from gay, lesbian, and bisexual identities, providing a basis for Transgender Studies as a field separate from queer theory. The second, Henry S. Rubin's article "Phenomenology as Method in Trans Studies," makes the similar argument that dominant methods in queer theory and feminist anthropology do not account for transgender people's subjectivities as sources of legitimate knowledge. Rubin notes that queer theory and feminism tend to view gender transition as a simple reiteration of gender norms, while phenomenology helps us understand how gender transition might subjectively *feel* to transgender people like becoming something we already are.

In its second decade of formalization (2000–2010), Transgender Studies took up these claims, expanding its engagement with phenomenology in order to deconstruct normatively gendered and sexed embodiments. This allowed the field to reveal how all expressions of gender and sex are produced through the same material and sensory processes. Two texts clearly illustrate this approach. Nikki Sullivan's 2006 essay, "Transmogrification: (Un)becoming Other(s)," argues that transgender body modification should be considered one particular type of a wider class of "trans" practices that would also include tattooing, piercing, and common cosmetic and reconstructive surgeries. By demonstrating that most bodies are shaped by these "trans" forms of modification, Sullivan points to how negative attitudes toward gender transition are hypocritical and held in bad faith. Gayle Salamon expands on this strategy in her 2010 book *Assuming a Body: Transgender and Rhetorics of Materiality,* in which she uses phenomenological theory to claim that all subjective consciousness is formed through a split between the felt sense of embodiment and the body's materiality. Because reality cannot be directly grasped by the mind, we cannot actually *know* whether the material sex of the body is an accurate reflection of our subjective gender. This universalizing move argues that transgender experiences of gender are no more delusional or imaginary than those of cisgender people.

By the second decade of the 21st century, Transgender Studies had proliferated into a widely interdisciplinary field, allowing for new applications of phenomenological theory and method. However, the increasing volume and range of the field has diversified the manner in which scholars make use of phenomenology. Two works published only a year apart demonstrate this variation. Ephraim Das Janssen's 2017 book *Phenomenal Gender: What Transgender Experience Discloses* uses Heideggerian phenomenology to illustrate how the sex and gender system of the modern West is an incomplete representation of the sensorially available world. Janssen deploys phenomenological theory to make the broadest possible argument—that the presupposed binary structure of gender has prevented most philosophers from approaching the question of what gender *is*. Because philosophers have tended to only focus on gender when there is a "problem" (such as transgender subjectivity), they have not produced a theory that describes all experiences of gender. Janssen thus implements phenomenology to illustrate how binary preconceptions of gender have in turn limited the science of human biology, leading to the concept of sexual difference itself. By contrast, Gayle Salamon's 2018 work *The Life and Death of Latisha King: A Critical Phenomenology of Transphobia* examines the 2008 shooting of 15-year-old transgender girl Latisha King by her junior high classmate, Brandon

McInerney. Salamon draws on the phenomenological concepts of comportment, movement, and anonymity to produce a close reading of Latisha's death, arguing that her murder was the result of specifically transphobic reactions to her body moving through space and time. Salamon makes meticulous use of phenomenological methods to parse how violent transphobia is produced by and through common assumptions about how bodies should look, move, sound, and act. Janssen's and Salamon's works—one broad and universal, and one focused and specific—represent the topical range and theoretical promise that phenomenology offers to Transgender Studies.

Philippines, Gender Categories

In postcolonial societies like the Philippines, trans, as a category of gender identity and expression, coincides with terms like *bakla, binabae, bayot, agi,* and *bantut*. Each term embodies particular histories of practice and contexts of experience and has circulated in the archipelago prior to the term *trans* as a globalizing category of gender-embodied variance and thus the threat and actual displacements by it. For the purposes of this entry, the focus will be on the relations between trans/transvestite/transsexual/transgender identities and *bakla* and its cognate terms, in their autochthonous (indigenous), colonial, modern, contemporary, and postcolonial/decolonial historicities.

Autochthony of Gender Diversity

A discussion of archipelagic categorizations of gender would be incomplete without describing the notion of woman (*babayi*), not as an essence, but as an analytic, in an autochthonous society. Indigenous ways of life viewed persons through their roles performed in the community. In other words, gender was given meaning in terms of social function. Being a woman or a man was a matter of occupation. Communities were run by the chieftain (*datu*), the smith (*panday*), and the priestess (*babaylan*). The babaylan (in some accounts, *katalonan, daetan,* and *anitera*) was associated with babayi (woman). Yet, because gender was understood as an occupation and a role not fixed on birth sex, sex-assigned male at birth but female-presenting people were allowed to perform priestessly duties and were considered women as they conducted themselves as such. They were called *asog* or *bayog* (sometimes, *bayoguin*). A remarkable feature of this feminine status is that gender-crossing is signified by the donning of women's clothes. The transvestic act accorded the asog with the kind of life associated with and expected of a babayi. Their bodies were rumored to possess a different set of genitalia, and men engaged them as they would a person sex assigned female at birth. Thus, *kasarian,* the vernacular notion of gender, guided understandings of gender diversity. The root word *sari* means to classify, and the indigenous taxonomic order was not based on a binary.

Chronicles written during the Spanish colonial period attest to instances of gender variance through the asog/bayog in communities all over the archipelago. Manuscripts present diverse encounters with the figure of asog/bayog. Colonial religion promulgated the demonization of the divine female and introduced the concept of homosexuality as a sinful act to protect cis heterosexual

masculine priesthood and cis heterosexual marriage. However, the asog/bayog could not be apprehended within the regulatory sex, gender, and sexuality binaries of the imperial order and embraced a mode of dissidence instead.

Vernacular Gender and the Language of Difference

Contemporary academic and activist discourses have productively engaged these indigenous terms in queer and transfeminist gestures, yet these also have colonial imbrications. The Philippines is an archipelago of more than 7,000 islands and over a hundred languages spoken by 109 million people. This section discusses Philippine gender categories in four languages: (1) Tagalog (*bakla, binabayi*), the language spoken in southern Luzon; (2) Binisaya (*bayot*), which is spoken in the Visayas and some parts of Mindanao; and (3) Kinaray-a and (4) Hiligaynon (*agi*), which are spoken in the islands of Panay and Negros in the Visayas and in some parts of Mindanao. Filipino is the national language, the lingua franca based on Tagalog and other languages of the country. As creolized terms influenced by Spanish and English, respectively, *talyada* and *biniboy* are considered Filipino words. While presented here as a Tagalog term, *binabayi* (also *binabae*) also appears in other languages, like Pangasinan, Kapampangan, Bikol, Maguindanao, and Tiruray. Because of Tagalog prominence, the term *bakla* circulates widely and is arguably the dominant signifier for vernacular gender nonconformity.

The popular etymology of *bakla* derives from the first syllables of the word for woman (*babae*) and man (*lalaki*). This mixing of genders can be found in the 1860 publication of the *Vocabulario de la Lenga Tagala*. In the text, the binabayi is a man who appears like a woman, if not an intersex person. The bakla undergoes several changes in the 17th-, 18th-, and 19th-century editions of the *Vocabulario de la Lengua Tagala*. In 1613, *bakla* pertains to persuasion (*persuadir*) and deception (*engañar*), while in 1794, it refers to a sense of perturbation (*inquietud*) and an experience of hurt (*desolladura*). Later, in 1860, these early meanings of *bakla* became integrated into the coordinates of deception (*engañar*), seduction (*enlabiar*), beauty (*hermosura*), and prominence (*lustre*). While the sense of trauma remains (*desollarse*), a fear toward something new (*espanto de cosa nueva*) became inscribed. Most significant is the association of *bakla* with *alteracion* (change), which is the earliest reference to the transformative phenomenon that characterizes trans subject formation. In these accounts, only the binabayi is embodied in terms of appearance and anatomy, while the bakla points to a set of mixed feelings toward a thing, event, or a person that is unknown. Here, the binabayi and the bakla reveal a phenomenology of gender recognition, with perception valorized as a legitimate place of verifying or invalidating the authenticity of the gender-variant body.

It is recognized that the bakla/binabae possesses a *pusong babae* (woman's heart) despite being assigned male at birth. The bakla, having a pusong babae, does not believe she has the wrong body, however. Such consciousness gives her not only subjectivity but also the agency to determine herself and identify as a woman. Unlike the autochthonous asog/bayog, the contemporary embodiment of the bakla/binabae does not need to wear feminine apparel to become woman. She is already understood to be a woman at her core. The hermaphroditic preconception transcends the body and is transformed into an internal knowledge of femininity. Here, the root of *binabae* is *babae* and may be refunctioned as a verb. In this instance, *binabae* would mean "turned into a woman." This reading of the binabae becoming woman may be employed to understand the same process of feminization a cisgender woman undergoes in realizing herself.

Intersexuality and notions of effeminacy dominated the discourse on the binabayi's difference in the 1914 *Diccionario Tagalog-Hispano*. The text portrayed the gender-variant figure as a grotesque identity form that could not be accommodated within a binary model of masculinity and femininity. This understanding circulated during the first decade of American colonialism, along with residual knowledge of autochthonous gender diversity and still-dominant notions of gender deviance from the Spanish colonial period, insisting on the historical tensions concomitant to suppressing what is perceived as recalcitrant to the new imperial order. During the Japanese colonial period, binabayi suffered as comfort women who

served the sexual needs of the imperial army. After World War II, biniboys became a concern among the police of Manila. A female journalist wrote about how worrisome they were, especially because they attracted foreigners who visited the city. Here, conservative attitudes conflated the binabayi with sex work. *Bini* is the word for feminine elegance, which serves as the root of the Tagalog address for single women (*binibini*). While *bini*- marked these bodies as feminine, -*boy* reiterated the grotesque identity form that they represented, inauthentically female because of the so-called truth of their anatomy.

The intersex motif is also found in the Visayan bayot. In Visayan, bayot is understood as a woman with a penis (*babaeng na-ay uten*). Unlike the bakla or binabayi, however, *bayot* appears quite late, in 1849, and it only resurfaces in a newspaper article published in 1916 about a woman who wants to divorce her husband because he is a bayot. In this way, this figure troubled how relations were conceived and conducted in Cebuano society. The bayot was also employed in popular nationalist discourses during the American colonial period. In this context, the bayot was a political figure represented as effeminate to question his decisions and alliances. In these cases, *bayot* served to mainstream gender difference as a political identity, describing how dangerous it can be to deviate from dominant notions of normalcy.

Agi, as the signifier of the gender-diverse figure in Panay and Negros, also faces the documentary scantiness as encountered with *bayot*. Her appearance in the 1841 publication of the *Diccionario de la lengua bisaya hiliguiena y haraya* through *agui* registers her as *señal* (sign), *huella* (track), and *rastro de lo que paso* (trace of passage). *Agi* also refers to the act of walking by (*pasar andando*) and manifesting in various aspects of mobility, as *transitar, transito,* and *transitorio*. The agi is configured metonymically, as phenomenal movement, but only after portraying the senses as unable to cope with her flux. Similar to the Tagalog bakla described in the Spanish colonial period, the Kinaray-a/Hiligaynon agi in this instance is not an identity but a series of scenes identifying difference. She is a spectacle, but one that merely passes through, if at all.

In the 1960s, the *talyada* (from the Spanish *tallar,* which means to cut, shape, contour, or sculpt) was circulated alongside *transsexual*. *Transsexual* was a term made more visible by Danish American trans pioneer Christine Jorgensen, who appeared in the 1962 film *Kaming Mga Talyada* (*We Who Are Sexy*). Such a convergence of identities revealed not only local and global resonances in body modification but also the need for a translation between traveling terms and the idioms they encounter on the ground.

Contemporary Traversals of the Gender-Diverse Experience

Crucial points of contemporary discussions are vernacularity, translation/untranslatability, and gender as a phenomenon of language grounded in practice. These engagements point us to contexts where the language of gender diversity continues to historicize itself in discrete lives, which are also embodied collectively. According to Fenella Cannell's book published in 1999, the bakla in the Bikol region display immense powers of transformation through mimicry, especially in becoming female and aspiring to be Western through pageantry. *Bakla,* as a signifier, may refer to persons who are assigned male at birth but female in self-identification and feminine in presentation. This definition corresponds to a contemporary understanding of trans, yet *bakla* also refers to gay/homosexual men, queer folx, and cis heterosexual women who are also allies/accomplices (*babaeng bakla*). Some scholars argue that the bakla and the homosexual belong to different systems, whereas others posit the bakla and the homosexual to relate in the context of diasporic modernity.

Some scholars observe that the bakla vernacular has been displaced by gay globality, a repertoire of Western images of gender identity and sexual orientation that Filipino homosexuals desire to identify with. They claim that drag and trans idioms intensify this displacement as both look more appealing. In this way, *drag* and *trans* depart from the bakla's locality, offering a seductive anglophone genealogy. In an ethnography of the Tausug bantut in southern Mindanao, published in 1997, Mark Johnson claimed that the bantut's capacity to change herself is a mode of transgendering. This transing of the bantut, however, does not negate the vernacular groundedness of her identity but affirms her transformative

power to engage culture and emplace herself more deeply in it.

Activist contexts offer novel possibilities of identity politics through the term *transpinay.* They deploy *transpinay* to describe figurations of Filipina womanhood, which include pathways toward agency and coalitional possibilities through the bakla. Such nomenclature is powerful not only in announcing a modern subject but in introducing a woman who articulates her agency in decolonial and transfeminist terms.

Toward a Decolonial Trans Herstory

Trans may give gender-diverse women in the postcolony a language that helps them navigate identity in the contemporary setting. Yet, the term needs to engage with indigenous categories of gender that existed prior to colonial rule and are still embodied by gender-variant women in the present. Such recognition alone is a decolonial act, as it narrates a trans herstory after centuries of effacement. It also tempers the globalizing tendencies within Western understandings of transness that interfere with the intuition of trans subjects as they discover multiple pathways to self-determination. Trans women in postcolonial Philippines occupy an instructive position in calibrating their indigenous genealogy in relation to a cosmopolitan subjectivity, through the process of translating between trans and asog/bayog, binabae, bakla, agi, bayot, and bantut.

Physical Disabilities, People With

Social scientists have only recently begun to understand the intersectionality of trans and disabled identities. Considered separately, each population experiences the impact of significant disparity in access to resources. The intersection of these identities illuminates individual, interpersonal, and systemic manifestations of oppression and resiliency. This entry examines trans–disabled identity and its evolution, identifies risks experienced by trans–disabled people, discusses the resiliencies present across identities, and offers recommendations.

The Medical Model and Trans–Disability

The medical model defines disability as individual functioning within a norm of ability, followed by the assessment of illness and the intervention to cure or restore ability. The medical model of trans identities seeks to align gender identity, gender presentation, and gender role behavior toward an identified gender norm, enforcing a binary model of gender that defines trans identities and bodies as requiring restoration toward that norm. For trans–disabled individuals, "passing," or the capacity to approximate cisgendered abled bodies, becomes the organizing value of intervention or cure.

The limitations of that model have been articulated as both trans and disabled activists shifted

the focus away from the body and toward the environment, community, and society. In the 1960s and 1970s, the disability rights movement changed the focus of intervention from the body to the structures of society, asserting that disability identity itself was a reflection not of impairment and cure but a valuable aspect of human diversity. From that perspective, what is truly "disabling" are the structural, institutional, systemic, and interpersonal barriers imposed on disabled people, all of which ultimately limit and define their access to full participation in the community. In that sense, disability is no longer a medical diagnosis demanding intervention and cure but a civil rights issue of people systematically being excluded from participation in society and access to the institutions that sustain that society.

Human Variability and Universal Design

Other models for understanding disability also extend the focus away from the body and toward the disabling environment. The study of *human variability* identifies and describes the extent of variation of human functioning. *Universal design* is a model that asserts that all structures and products be made for maximum use across abilities. Both ideas have been engaged to articulate the environment as largely defining disability and its impact. These theories call into question the category of disability, asserting instead that human diversity includes a range of functioning and that systems and environments need to accommodate that range of human experience. However, while these models recognize the importance of participation in environments and communities, they fail to capture the complexity of disability as an identity category.

Disability Justice

Disability justice provides a model of disability that recognizes that a disabled identity interacts with and is shaped not by disability alone but by the intersection of identities, including gender and gender identity, class, age, race, and culture. From this perspective, the interaction of disability with other demographic categories determines both access to resources and magnitude of the disabling environment.

Trans identity evolution follows a similar trajectory, from significant mental illness to medical condition to civil rights movement to complex and meaningful identity category. Although trans people have always been present in societies, the ways in which this heterogeneous population has been understood have varied significantly. From the perspective of the medical model, the discussion has ranged from severe mental illness to birth defect. In the 1950s, sexologist Harry Benjamin asserted that the point of intervention for trans people needed to shift. Rather than attempting to "cure" people of their felt sense of gender, the focus became that of modifying the body and the social environment to adapt to a more accurate reflection of each individual's felt sense of self and to improve participation in the human community.

Trans–Disability From Illness to Identity

Through the 1960s and 1970s, trans people gained greater recognition as inhabiting a meaningful identity and community. Benjamin's work was recognized in 1979 with the founding of the Harry Benjamin International Gender Dysphoria Association, now called the World Professional Association for Transgender Health (WPATH). That collaboration sought to develop common understandings and best practices for responding to the ever-diversifying needs of the trans population, eventually emerging as the Standards of Care (SOC).

Standards of Care—An Evolution of Understanding

Currently in its seventh edition, the SOC illustrates an evolution of understanding. Earlier versions reflected the values of "cure" and measured, for example, an individual's capacity to be perceived and experienced in their felt sense of self or affirmed gender as a condition of access to care. The current SOC has emerged from a "normalizing" stance to one that seeks to respond to needs not limited to body or mind but to an internal or felt sense of self. By that measure, the SOC focuses attention on relieving gender dysphoria or distress. Responding to evolving professional practice, as well as social and political change, the current SOC recognizes that, not unlike disability, the distress associated with trans identity is informed by access to and participation in social structure and

that access becomes a primary determinant of health. Evident in the convergence of these identities is the recognition that true pathology is not founded in mind or body alone but in access to material, social, and emotional resources.

At the Intersection of Trans and Disabled Identity

The U.S. Transgender Survey

In 2015, the National Center for Transgender Equality conducted the U.S. Transgender Survey (USTS), the most comprehensive survey to date of the experiences of close to 28,000 trans people. The information gathered across identities demonstrates the ways in which intersecting identities compound the experiences of oppression. Trans–disabled people experience consistent and significant barriers to accessing resources for survival and well-being, including access to health care, education, employment, financial resources, transportation, and appropriate accessible housing.

Survey Results of Trans–Disabled Respondents

The USTS found that trans people reported higher levels of multiple disabilities than the general population (39% vs. 15%). Within the population of trans people with disabilities (i.e., trans–disabled people), 45% of respondents lived in poverty, as compared with 29% of nondisabled respondents. Trans–disabled respondents reported greater challenges in overall health, including diabetes, cardiovascular health, and mental health. Trans–disabled people experienced higher levels of overt descrimination that impeded both accessing care and the quality of that care. The report reflected, in fact, that trans–disabled people experience barriers at higher levels across the board.

Trans–disabled respondents in the survey also reported higher levels of interpersonal distress, including higher levels of bullying in primary school and higher levels of harassment, unemployment, termination, and housing discrimination in adulthood. Trans–disabled people are two to four times as likely to experience violence, sexual violence, abuse, and neglect.

Trans–disabled people who are housed in supportive housing or make use of care attendants face additional risk to physical and emotional safety and care. Most supportive housing environments explicitly deny access to sex of any kind and can severely limit or control clothing and other sources of gender identity expression. Disabled people in care are also disproportionately at risk of abuse. This level of prohibition and danger can leave some trans–disabled people in the position of having to choose between identity, identity expression, and access to safety.

Ableism Meets Transphobia

Ableism refers to a fear of disability and/or a set of beliefs or actions that devalue disabled people. This can include "well-intentioned" actions that regard disabled people as objects of charity, remove or inhibit autonomy and self-direction, presume the need for care, or impose judgments on the disabled person's life or choices. Ableism and transphobia can converge to create a complexity of discrimination. Ableism can portray disabled people as asexual, hypersexual, or infantilized. Any expression of gender identity or sexuality may be ignored or actively repressed. Organizations, providers, and family members informed by ableism can inhibit the agency and autonomy afforded disabled people. This, in turn, can limit and even prevent disabled people from asserting the need for or accessing gender-related care. Trans–disabled people experience barriers to material, social, and emotional resources at the intersection of trans–disabled identities. Vulnerable to the impact of prejudice, descrimination, and limited social connection, trans–disabled people experience disproportionate levels of physical and sexual abuse and neglect.

Although higher levels of academic education will tend to serve a compensatory function across other forms of oppression, education does not have the same mitigating function for transgender people, often due to disabling environments. Family acceptance has been demonstrated to be a powerful compensatory resource, but for trans–disabled people, access to family support can be fraught. Family beliefs and values around disability can affect their response to trans identity. Access to acceptance can be made more complex in a family culture that struggles to regard their disabled family member as having a more complex identity. While finding community is an essential

resource for mitigating the impact of stigma, trans–disabled people report higher rates of social isolation and limited opportunities for engagement in community and are faced with both structural and transphobic/ableist bias.

Resources of Resilience

Disability Pride (derived from Gay and Lesbian Pride, Trans Pride, and other identity pride movements) asserts that disabled identity is inherently valuable and that the experience and knowledge derived from being disabled can cultivate individual, community, and cultural strengths and resources. Trans–disabled people in the disability justice movement challenge models of independence in favor of interdependence, creating models of collaborative care and exploring alternative strategies for accessing resources. Online communities of trans–disabled people serve as important resources for social support and connection. Inhabiting a trans–disabled body requires creativity, strategy, and adaptability.

Conclusions and Recommendations

Trans–disabled people are a significant and growing population within trans communities. Trans–disabled people experience profound levels of discrimination, violence, and oppression. Transphobia and ableism create substantial barriers to the material and psychosocial resources that support health and well-being. The experiences of trans–disabled people magnify the ways in which oppression of trans people further determines health care experiences and outcomes.

As many advocates have noted, trans–disabled people should be supported in identifying and acknowledging the individual, interpersonal, and systemic forces of transphobia and ableism that are affecting them. Intervention should further seek to identify resources of support. This can include advocating for informed health care providers, identifying violations of the Americans With Disabilities Act (ADA), advocating for access, and contributing to sources of education for providers, individually and institutionally, to increase knowledge and competence regarding trans–disabled people. Trans–disabled community and social connection are a vital source of well-being. Trans–disabled people should also be supported in strengthening current relationships, which may include improving communication and existing relationship dynamics.

From an identity-pride perspective, helping people identify and engage existing strengths and creativity in navigating a largely inaccessible often transphobic world is crucial. Recognizing the value of the intersection of these identities is a potent resource of resiliency of trans–disabled people. Informed care both names and seeks to ameliorate levels of oppression and impact.

Planned Parenthood, Trans Inclusion

Although Planned Parenthood (PP) is typically known for its work in family planning (contraception and abortion), it does provide a wide variety of reproductive health–based services, including trans-affirmative services. Planned Parenthood Federation of America (PPFA), or Planned Parenthood (PP), is a U.S.-based health care not-for-profit organization that delivers vital reproductive health care, sex education, and information to millions of people in the United States and worldwide. PPFA has clinical sites in each of the 50 states in the United States, which may provide a variety of reproductive health services, including birth control, long-acting reversible contraceptives, vasectomies, emergency contraception, pregnancy testing, pregnancy options counseling, referrals for adoption services, prenatal care, abortion, testing and treatment for sexually transmitted infections, prevention of sexually transmitted infections, chest cancer screening, care for LGBTQIA+ persons, sexual health education, and advocacy programs. PPFA has advocated for access to care for all members of the community, and it advocates for legislative, legal, and political protections of these reproductive rights. PP Global is an international arm of PPFA that partners with organizations in Latin America and Africa to advance reproductive health and rights by assisting international organizations in their efforts to develop culturally appropriate programming and services for the communities they serve. Gender-affirmative care fits within the mission of PP to medically prioritize body autonomy and self-determination and to support social justice efforts promoting equity in access to resources and safe communities.

Reproductive Justice Framework

PP views gender-affirming care, including gender-affirming hormone (GAH) therapy, as an important service that goes to the core of their mission, which is centered on reproductive justice (RJ). SisterSong, the Women of Color Reproductive Justice Collective, defines the reproductive justice framework as "the human right to maintain personal bodily autonomy, have children, not have children, and parent the children we have in safe and sustainable communities." The RJ lens acknowledges that each person or patient must have bodily autonomy in order to be free and in order to have equity in health care. Reproductive justice contextualizes reproductive health and access as within the scope of human rights and social justice. The RJ framework recognizes that marginalized persons have a wide variety of identities and unique needs and that RJ can only be achieved when all persons have the social, political, and economic power to make their own decisions about their bodies, their gender and sexuality, and reproduction.

Trans people represent one group that often encounters problems of access and discrimination in health care. Many trans people find they face discrimination in clinical settings, ranging from bias to outright harassment and refusal of care. Trans individuals also suffer disproportionate rates of economic disadvantage and insecurity that range from being denied employment or promotion, being fired, or on-the-job harassment and discrimination based on gender identity. Trans persons have higher risks for experiencing abuse and violence (verbal, emotional, physical, and sexual) at some point in their lives. Trans persons of color face even greater challenges due to the intersectional impacts of gender and systemic racism that are still perpetuated today.

Gender-Affirming Care Within PP

GAH services vary by site, but as of 2020, a variety of PP clinics throughout the United States offer primary care as well as gender-affirming hormone therapies for the trans community. In addition to the services listed above, PP uses an informed consent model to provide GAH, including pubertal suppression (with parental consent), along with testosterone and estradiol therapies. They also provide information and links to accessing necessary information and local resources for both legal name change and gender marker change on birth certificates and other legal documents.

PP clinics have adapted their intake methodology and demographics to universally ask for and include chosen name and pronouns, sex assigned at birth, and gender identity. At centers that offer services, staff receive education and training to support a trans-inclusive environment as well to as educate staff regarding addition of newer feminizing and masculinizing hormone therapies. Patients eligible for gender-affirming hormone therapies must be age 18 and over and capable of providing consent. Services for minors, if offered, involve parental consent and potentially additional referral information. As with all their sexuality-based services, PP offers confidential services within PPFA-based national standards and guidelines that are based on extensive research and benchmarks for care, and they are regularly reviewed on both national and local affiliate levels.

PP Advocacy for Trans Rights

PP's role extends beyond provision of care for individual patients and into a national forum of social and political advocacy and leadership. PP has a long history of partnering with local and community agencies. For example, PP League Massachusetts and local members of the community have created a multimedia campaign titled "My Care. My Way," which is "designed to elevate the voices of our local trans community, educate and inform the community about providing hormone therapy, and promote our model of informed consent." On a national level, PP participates in Transgender Awareness Week and also works on a national level to decrease federal and political attacks on the civil rights of trans persons: Indeed, PP recognizes and affirms the value of being visible, of being acknowledged, and of having autonomy and access to care. At present, because many states and communities have limited access and options for both trans and family planning services, PP may serve a vital role for citizens in areas of the United States that are underserved and at risk for health care disparities. As a health care entity that understands and promotes a human and civil rights framework for body autonomy in health care decision making, as well as an organization that socially and politically recognizes the complexity of the intersectionality of various identities, gender-affirming health care is well within its expertise.

Poetry and Poetics

Trans poetry is the writing of poems and the practice of poetry by trans writers, particularly those who consider themselves poets. Trans poetics is writing about this body of literature, which so far has tended to have a manifesto-like quality and to engage in reflections about the meanings of one's own work. While only becoming visible as a literary category in the 21st century, trans poetry now seems to be both popular and inevitable. This entry begins by explaining why issues surrounding the genre are different from those faced by trans memoir or fiction. Next, it discusses how early theorists

and practitioners have defined transgender poetry and poetics, and it briefly outlines methodological questions for studying trans poetry and poetics. The entry concludes with an overview of the recent history of trans poetry as a visible medium, including a discussion of significant anthologies, journals, awards, and the genre's presence in publishing.

Differences From Trans Memoir and Fiction

The concerns of trans poetry are just beginning to come into focus, and they appear to differ from discourses around trans literature, a category that usually refers to trans memoir and fiction. Much of the trans literature published during the 20th century consisted of memoirs, and stories in these memoirs documented elements of trans history prior to the creation of the field of trans studies. The autobiographies of Lili Elbe, Christine Jorgensen, Jan Morris, and Renée Richards were widely read for decades, especially by trans people as inspirational stories about how they could transition and lead happy lives. Poetry, by contrast, does not tell transition stories very well; it is different from both memoir and fiction in the sense that it tends to emphasize brevity, lyricism, and linguistic form.

Trans fiction writers have found themselves in conversation with these earlier trans-authored memoirs, as well as with cis fiction writers' misrepresentations of trans subjects. One example of such misrepresentation is *Myra Breckinridge,* a 1968 book by cis author Gore Vidal, which trans studies scholars have critiqued for appropriating elements of Christine Jorgensen's narrative in a somewhat mocking way and selling more books in the process than Jorgensen's original. Trans fiction writers have responded to this situation by making two arguments: that trans authors should be the ones telling trans stories, not cis authors, and that the most progressive trans fiction is that which presents trans issues in a way that avoids reproducing clichés of trans narrative.

In contrast, poetry's relative inability to tell stories and do narrative means that it does not really offer trans narrative clichés that can be easily appropriated, as they can in fiction. And whereas fiction tends to treat the writer more like a transparent participant telling a story that exists outside of themselves, poetry often implies that the writer is the main character, so it would be illogical to argue that the existence of the trans person writing the poem is a narrative cliché. Because trans poetry does not draw upon the tradition of trans memoirs or narratives in a direct way, it ends up being concerned with a different set of issues than trans fiction.

Trans poetry has instead been mostly a category that selects through self-identification. Most of the authors who do it choose to represent themselves as both trans people and poets, rather than trying to take sides in a moral debate about what makes the writing a good representation or a bad representation. Given the dearth of visible trans poets prior to 2013, there would have been no obvious career advantage to describing oneself as writing trans poetry; if anything, it would have been a disadvantage. Authors who have written and published trans poetry during the past decade have tended to be trans writers who care enough about their personal relationship to both categories, transgender and poetry, to pursue them together, often in the face of various obstacles. Meanwhile, in most cases, cis poets have historically not been motivated to present themselves as writing poems about trans issues.

Methodological Questions for This Field

In trans poetry, how we define one of the terms *trans* or *poetry* has implications for how the other is defined and for what constitutes the field itself. A number of questions are in circulation, because the development of the field is still in flux. Just a few such questions include how we define *trans,* to what extent it is an umbrella term, and to what extent the different identity terms associated with it (genderqueer, transsexual, nonbinary, etc.) may each desire a literary category for their own identity. When we theorize trans poetry, there is a question about the extent to which we need to attend to the ways that various trans-related identity terms have changed over time or taken on different meanings through time. It is also important to consider whether trans poetry applies broadly to anyone who was gender nonconforming at any point in history, as well as whether some established, deceased poets might be claimed as trans who did not identify with the category. What role does transition, medical or otherwise, play in the category,

and what role do pronoun changes play? How do we define trans identity in relation to deep and important structural concerns such as colonialism, racial justice, class struggle, and gender inequality? There are questions regarding whether anyone who has ever written a poem is a poet or whether a larger body of work needs to be involved. It is also important to think about who counts as a poet, whether readerly reception of the poetry is necessary, whether the poetry needs to have some kind of audience or has been published, and whether the publishing needs to involve books. Does the writing need to be poetry that "looks like" a brief lyric poem on the page, something written in a recognizable poetic form, or can the form be invented through experimentation, perhaps even prose poetry? And finally, it is important to think about to what extent trans poetry needs to contain overt elements that can be described as trans—whether it should always reflect something about the transness of its author.

Trans Poetics

Answers to some of these questions have been offered by early theorists of trans poetics, such as Trish Salah, Joy Ladin, and Trace Peterson. Salah, in her 2009 article "After Cissexual Poetry" (published in the journal *Aufgabe* but adapted from her earlier dissertation *Writing Trans Genres*), strategically recognizes cissexual poetry as a construction, showing how trans people have been misconstrued as types of figuration throughout contemporary theory and in representations written by cis people. As part of a larger examination of what she calls "trans genre" texts, Salah combines Sandy Stone's "The Empire Strikes Back: A Posttranssexual Manifesto," Viviane Namaste's argument in *Invisible Lives,* and Kate Bornstein's postmodern literary performances to sketch the outline of a productive frame for understanding trans poetics. In the process, Salah suggests that literature has continually misunderstood trans lives because trans people have often not been in the room or have not been part of the theoretical, feminist, or literary conversation, replaced instead by types of figuration written by cissexual theorists and authors. Salah offers a counterexample to this trend of figural substitution through a discussion of trans poets Nathalie Stephens (Nathanaël) and kari edwards. Rather than an argument about trans narrative as in the memoir/fiction discourse centered on avoiding clichés, Salah tries to open up space for the ontological status of the trans subject in relation to literary activity, and with this argument, she indirectly begins a discourse about trans poetry using a starting point particular to poets as writers.

Joy Ladin's 2011 essay "Ours for the Making: Trans Lit, Trans Poetics" carries some of these arguments further by selecting a nonnarrative starting point for describing poetry by trans writers. In this essay, Ladin asks why there is a gay and lesbian literature but not a trans literature in the same sense yet. She notes a relative absence of trans literature in 2011 outside of memoir and argues that trans literature can be "literary writing that reflects some aspect of the transgender experience." The example that she provides is autobiographical, looking at her own poetry in the book *Psalms* as an example of "a definition of Trans Lit that finds trans content not just in demographics and subject matter but in syntax, word choice, and other qualities of language" (Ladin, 2011). In the process she raises the question of whether formal qualities of poetry can be considered trans, especially when it is written and reflected upon in a manifesto-like way by trans writers such as herself.

Trace Peterson's "Becoming a Trans Poet: Samuel Ace, Max Wolf Valerio, and kari edwards," was the first article on trans poetry published in a peer-reviewed academic journal, in *TSQ: Transgender Studies Quarterly,* in 2014. Learning from the examples of both Salah and Ladin, Peterson makes an overt argument for what the category "trans poetry" means by looking at shared formal elements in the work of Ace, Valerio, and edwards—three of the first trans poets to publish a book in the United States. Juxtaposing how these authors' poetic careers run parallel to their gender transitions, Peterson examines the relationship between being trans and being a poet for each of them and contextualizes readings of their poems with biographical interviews. She identifies three formal qualities characteristic of trans poetry, based on their work. First, trans poetry "avoids directly presenting a narrative about being trans." Second, it "exhibits an ego-dystonic sense of undertow," meaning that poems by trans poets "destabilize an idealized sense of self in the articulation of that self" through experimentation with language.

Third, poems by these authors "push the borders of genre, writing a kind of poetry-within-prose relying on 'gaps' or leaps that suggest ghostly line breaks," in other words "lines of poetry that have been strung together as prose, leaving extra space where each break used to be" (Peterson, 2014). Peterson concludes that either there is something inherently trans about this aesthetic, or it may end up being a coincidence given surrounding contextual factors. This article makes the category of trans poetry visible in an academic context, highlighting trans poets who are well established and offering some of the first analyses of their poems.

Troubling the Line

Prior to 2010, trans poetry was largely invisible in the United States, and the category "trans poet" was not an intuitive one in the largely cis poetry scene. Since then, there has been an explosion of interest in trans poets, especially in the field of creative writing. What prompted this shift was the 2013 publication of the anthology *Troubling the Line: Trans and Genderqueer Poetry and Poetics,* edited by TC Tolbert and Trace Peterson and published by Nightboat Books. The first poetry anthology dedicated exclusively to trans writers, *Troubling the Line* features 55 trans and genderqueer poets, including Ahimsa Timoteo Bodhran, Aimee Herman, Ariel Goldberg, Bo Luengsuraswat, CAConrad, Ching-In Chen, Cole Krawitz, D'Lo, David Wolach, Dawn Lundy Martin, Drew Krewer, Duriel E. Harris, EC Crandall, Eileen Myles, Ely Shipley, Emerson Whitney, Eric Karin, Fabian Romero, Gr Keer, HR Hegnauer, j/j hastain, Jaime Shearn Coan, Pam Dick, Jay Besemer, Jenny Johnson, John Wieners, Kit Yan, Lauran Neuman, Lilith Latini, Lizz Bronson, Lori Selke, Meg Day, Micha Cárdenas, Nico Peck, Natro, Oliver Bendorf, Reba Overkill, Stacey Waite, Stephanie Burt, TT Jax, Y. Madrone, Yosmay del Mazo, and Zoe Tuck.

Troubling the Line emphasized a diverse range of poetry aesthetics; it included lyric poems, longer serial poems in sections, prose poetry, slam poetry, and other forms. The constellation of writers in the book also represented a diverse range of identity experiences under the trans umbrella. The "open call" requesting poems for the anthology, publicized by Tolbert and Peterson in 2011, connected identity with aesthetics by arguing "the writing of trans and genderqueer folks has something more than coincidence in common with the experimental, the radical, and the innovative in poetry and poetics." The book reflected this confluence of diverse identity and diverse aesthetics through the inclusion of "poetics statements," which connected identity and poetry. In the open call, Tolbert and Peterson describe these statements:

> This is a chance for you to tell us something about your writing process, writing practice, theory of life, or whatever you like. It might include the relationship of the body and text, or the practice of reading and misreading text and the body, or locations, connections, and divisions of the self amongst text and the self amongst other bodies. (https://transanthology.com/2011/08/26/open-call-anthology-of-trans-genderqueer-poetry/)

The senses of trans poetics suggested by *Troubling the Line* thus built upon Salah's assumption that trans people should not be merely reduced to figures within their own texts, as well as Ladin's assumption that trans poetics has something to do with trans experience and can be carried out through the use of formal elements rather than just narrative ones.

Widely reviewed, *Troubling the Line* provided overwhelming evidence that trans poetry was its own literary category, making it much more difficult for cis people in the poetry world to continue to ignore the writing of trans poets and making it more difficult for the trans literary world to continue to neglect poetry. The visibility provided by the anthology boosted the careers of numerous poets in its pages, who soon proceeded to publish their first books in 2014 and 2015.

In the Introduction to *Troubling the Line,* Peterson cites early trans poet kari edwards as an influence on her and the anthology. One of the key elements of this influence was edwards's stint as poetry editor of the International Foundation for Gender Education's (IFGE's) influential magazine *Transgender Tapestry* between 2000 and 2005, when she published poems by trans writers. Some of the trans poets edwards published during this period included Angela Dobbs-Sciortino, Julia Serano, and Trish Salah. edwards's oeuvre as a poet was impressive; she authored 10 full-length

collections of poetry, one of which won the New Langton Arts Bay Area Award in literature. These collections were written starting in 1999, from the time edwards transitioned and began writing poems, through 2006, when she suddenly died of a pulmonary embolism. Five of these collections were published as full-length books during her lifetime and three were published after her death. edwards was featured posthumously in *Troubling the Line,* with her manifesto “a narrative of resistance” as her poetics statement.

Ever since *Troubling the Line,* trans poets have suddenly been “in demand” in the literary world in a way they mostly were not before. Within just a few years, this dramatic increase in visibility has resulted in the publication of additional trans poetry anthologies and journals, a substantial entry of trans people into small press publishing, the creation of multiple trans poetry awards, the publication of many trans poetry books, and the emergence of numerous notable trans poets who are increasingly widely read and reviewed.

Anthologies

A number of trans-edited poetry anthologies appeared following *Troubling the Line,* all issued by small presses. In 2015, Trans-Genre Press published *Writing the Walls Down: A Convergence of LGBTQ Voices,* coedited by queer writer Helen Klonaris and nonbinary poet Amir Rabiyah. *Writing the Walls Down* collects a group of LGBTQ writers around its guiding metaphor of dismantling walls: “what stories do city walls, border walls, school walls, hospital/hospice/medical walls, office walls, shelter walls, government agency walls, and prison walls have to tell us. . . . How do these walls mirror the ones we learned to build inside our own bodies? And what have been the consequences?” This frame productively encouraged dialogue between writers, and the anthology emphasized trans writers, poets, and writers of color. Some trans authors featured in it are Aiyyana Maracle, Eli Clare, Jordan Rice, Andrea Lambert, Dane Slutzky, Tiffany Higgins, Danez Smith, lee boudakian, Aaron M. Ambrose, Jennie Kermode, Moon Flower, and Thokozane Minah.

In 2017, Sibling Rivalry Press published the anthology *Subject to Change: Trans Poetry & Conversation,* edited by H. Melt, which features five trans poets of color: Joshua Jennifer Espinoza, Christopher Soto, Beyza Ozer, Cameron Awkward-Rich, and Kay Ulanday Barrett. This anthology includes several pages of poems by each writer followed by a brief interview between the editor and the poet. In the Introduction, H. Melt claims two main influences: *Troubling the Line* and an anthology of five Black queer poets titled *Prime: Poetry & Conversation,* which features trans poet Rickey Laurentiis, among others, published by Sibling Rivalry Press in 2014. H. Melt’s interviews in *Subject to Change* involve reflections about the meanings of poems in the anthology, social justice, feminism, community, and literary influence.

In 2018, Nightboat Books published *Nepantla: An Anthology Dedicated to Queer Poets of Color,* edited by nonbinary poet Christopher Soto, who also goes by the name Loma. This anthology represents the culmination of a literary journal also called *Nepantla* that Loma edited in collaboration with Lambda Literary, publishing three issues between 2014 and 2016. Taking its name from Gloria Anzaldúa’s framing of the Nahuatl term *nepantla* as an in-between space, Loma in the first issue describes their aim as being “to nurture, celebrate, and preserve diversity within the queer poetry community” and “to center the lives and experiences of QPOC in contemporary America.” Poets published in *Nepantla* include a wide range of writers, some of whom identify as trans or nonbinary. Some of the trans poets published in the anthology include Paul Tran, Meredith Talusan, Qwo-Li Driskill, Jayy Dodd, Juliana Huxtable, JP Howard, Xandria Phillips, Assotto Saint, Ryka Aoki, and Pamela Sneed.

Journals

A number of literary journals that focus on trans poetry began after 2013 that were visibly edited by trans people. Such journals included *THEM* (the literary journal, not the later Conde Nast magazine) edited by trans poet Jos Charles, which published three issues from the fall of 2013 to 2017. Some poets featured in *THEM* include Hafsa Musa, Zareen Zahra Zeero, Aeliana Boyer, manuel arturo abreu, Alok Vaid-Menon, Lily Clifford, Valentine Conaty, and Cody Pherigo.

Another trans-edited literary journal is *Vetch: A Magazine of Trans Poetry and Poetics,* edited by

Stephen Ira, Kay Gabriel, Rylee Lyman, and Liam O'Brien, which started in 2015 and has published four issues, the most recent in 2017. Trans poets who have appeared in *Vetch* include Thel Seraphim, Francisco-Luis White, Zach Ozma, Wo Chan, Cat Fitzpatrick, Rebecca Bedell, and Zefyr Lisowski.

The Wanderer is another journal that began in 2016, which has trans coeditors and publishes some trans poets. Its current editors include Colette Arrand, Sara Bess, and Prairie M. Faul. Another recent journal that included some trans editors and featured some trans writers was *Femmescapes,* edited by Charles Theonia and others. The journal published four issues from 2016 to 2019. It was focused on "visual and written work by queer and trans people who experience an affinity with femmeness." In addition, the magazine *The Offing* published a special trans issue in the fall of 2015, and *Cream City Review* published a "Genre Queer" issue in 2016, edited by Ching-In Chen. Finally, another significant trans-edited publication is *Waves Breaking,* a podcast by Avren Keating, which has produced 32 episodes since 2016, each consisting of an extended interview with an individual trans poet combined with a reading by that poet.

The oldest trans-edited literary journal is *EOAGH: A Journal of the Arts,* edited by Trace Peterson, which began in 2004. This journal also features several trans poets on its board of contributing editors. EOAGH investigates ideas of reading and being written by language. It views "readings as embodied, interdisciplinary responses that engage with one's environment through documentary poetics, identity and the disruption of identity, ekphrasis, phenomenology, procedural multiplicity, density, and difficulty." Some trans poets who have appeared in EOAGH include Nat Raha, Grey Vild, M. Robin Cook, Natasha Dennerstein, Brody Parrish Craig, Kerry Downey, Kenyatta JP Garcia, Alyssa Harley, Luis Lopez Maldonado, Jimena Lucero, C. Russell Price, Phoenix Nastasha Russell, Rose Sanchez, Eero Talo, Audrey Zee Whitesides, Suneela Mubayi, and Jai Arun Ravine.

Awards and Recognition

Several trans poetry awards were created in the flurry of trans poetic activity after 2013, most notably the Lambda Literary Award in Transgender Poetry. Lambda Literary created this award in 2015 once it had proof that enough trans poetry books were being published to merit the category. The books that have won this award so far include *succubus in my pocket* by kari edwards (EOAGH Books), *Reacquainted With Life* by Kokumo (Topside Press), *recombinant* by Ching-In Chen (Kelsey Street Press), and *Hull* by Xandria Phillips (Nightboat Books). Another award created in response to the increased publication of trans poetry is the Publishing Triangle Award in Trans and Gender-Variant Literature, which began in 2016. Some books that won this award have been by trans poets, including *Some Animal* by Ely Shipley (Nightboat Books), *Even This Page Is White* by Vivek Shraya (Arsenal Pulp Press), and *The Middle Notebookes,* by Nathanaël (Nightboat Books).

Trans poetry has tended to be published so far by small presses and literary journals, many of which operate as nonprofit organizations. But it makes sense that an increased demand for trans poets might also involve a move to more mainstream, for-profit publishers. In 2016, Ari Banias's *anybody* became the first book of trans poetry to be published by a major publisher, W. W. Norton.

Police Relations

See Criminal Justice System.

Policing of Trans Bodies

The concept of policing trans bodies involves all the ways in which social institutions, governments, and individuals attempt to control, regulate, criminalize, and punish human behavior and expression that fail to conform to ahistorical, essentialist definitions of sex and gender. This has emerged from colonial processes; how policing happens with trans bodies now has been shaped by how this was manifested in the past, particularly how police in contemporary times interact with trans people of color. Ultimately, this means we cannot make the argument that more progressive forms of policing have ushered in a new way of policing trans bodies. As described in the following sections, trans bodies are now subject to even more criminalization and brutality from every part of criminal processing systems, including wider government systems.

Policing Trans Bodies as a Colonial Project

For centuries, patriarchal gender norms of European countries and colonists, emerging largely from religious belief systems, have been imposed upon the world. There is historical and anthropological evidence that, prior to colonization, Indigenous and native cultures across the globe recognized, accepted, and, in some cases, even celebrated or honored diverse gender identities and presentations. On nearly every continent historically, there have been individuals who held a third gender or dual-gender status. In many Native American tribes, they were/are known as "two-spirit people," denoting the combination of masculine and feminine spirits they manifest. English and Spanish colonizers came from countries where sodomy and sexual deviance were punishable by death. They believed the gender diversity and same-sex relations they observed in Indigenous cultures to be immoral and abnormal. In the Americas, the Spanish pointed to it as a reason to exterminate thousands of native people, colonize their lands, and force them to convert to Christianity. The violence perpetrated against native and Indigenous people because of perceived sex and gender role violations has since been termed *gendercide*. Possibly the first recorded incident of gendercide occurred in 1513 in what is now Panama when Spanish conquistador Vasco Nuñez de Balboa encountered the Indigenous people of Quaraca. Balboa saw what he perceived to be men "dressed as women" engaging in sexual relations with each other and ordered 40 of them to be dismembered by being thrown to his dogs. This type of violent punishment continued for centuries and was also perpetrated or directed by Christian clergy, military and government agents, and judges.

In the British colonies, there was a history of regulating dress to prevent individuals from disguising themselves as members of a race, social rank, or profession to which they did not belong. Several laws and city ordinances, the first in Massachusetts in 1690, were passed across the American colonies and later U.S. cities that explicitly punished crossdressing (i.e., wearing clothing in public that does not align with one's sex assigned at birth). In the 20th century, masculine-presenting lesbians and trans women were regularly harassed and arrested by police enforcing laws that required them to be wearing at least three articles of clothing that corresponded with their assigned sex.

In the 19th and 20th centuries, medical scientists and psychologists provided evidence that sex and gender diversity were innately human and natural. For example, in 1864–1865, Austrian doctor Karl Heinrich Ulrichs (1825–1895) anonymously published a theory of biology developed to describe those who have a soul opposite from the sex of their physical body. German doctor Magnus Hirschfeld (1868–1935) believed that the unique combination of genetics, secondary sex characteristics, psychological inclinations, sexual preferences, and culturally acquired habits and traits present in each individual meant that there were more than 43 million different kinds of genders, or humans. Hirschfeld established the Institute for Sexual Science in 1919, helped coordinate care for the first male-to-female surgical procedure for Dora Richter in 1931 (and also Lili Elbe), and worked with Berlin police to end the harassment and arrest of trans people. Hitler personally labeled Hirschfeld as "the most dangerous Jew in Germany," forcing

him to flee the country; in 1933, the institute and its library were ransacked and burned.

Advances in medical and psychological science during the 20th century did not bring an end to violence and discrimination against trans people. With the forced migration, relocation, and removal of Indigenous peoples in North America, many trans people were assaulted, emotionally abused, and given a substandard education. All of them were severed from their culture, including the proud history of two-spirit people and traditions of gender diversity. Although in the United States, the removal and forced migration of trans Indigenous people diminished in the 1950s and 1960s, police continued to police trans bodies by raiding queer recreational establishments, which sometimes included the beating and raping of drag queens. From this crisis emerged the first documented moments of resistance to police brutality, including the Compton's Cafeteria and Stonewall Inn Riots, which were significant turning points in LGBTQ history—but not before the further criminalization and brutalization of trans bodies by police, including the arrest of trans and gender-diverse people of color especially, as well as ongoing unrest and protest involving broader queer communities and straight allies. There is no doubt that colonial policing of trans bodies has shaped policing practices with trans people down to the present day.

Contemporary Policing of Trans Bodies

It would be erroneous to assume these serious forms of police violence perpetrated against trans people in the past have faded into irrelevance in contemporary, presumably more progressive, times. Police continue to overpolice, surveil, and raid queer leisure spaces, such as bars and clubs. In 2009, Lambda Legal filed suit for an incident in which the Atlanta Police Department aggressively conducted an illegal raid on a queer night spot and harassed patrons, although none were charged with crimes. Even more disturbing is how often police are involved in the killing of transgender people around the world. As of March 13, 2020, three police officers in El Salvador are being held in custody while awaiting trial for the kidnapping, beating, and murder of trans woman Camila Diaz. Duanna Johnson in Memphis, Tennessee, and Nizah Morris in Philadelphia were beaten by police officers prior to their deaths, which remain unsolved.

Police have a significant role to play in the perpetration of violence and discrimination against transgender people. Amnesty International has reported on how police officers across the United States interact with people whose appearance deviates from normative expectations of gender and how this has greatly affected the quality of police interactions with trans people. Research clearly demonstrates that cisnormative assumptions drive the interactions that police officers have with transgender people. Substantial police misconduct has been reported in recent research. In a 2015 study by Lambda Legal, for example, trans people (18%) were twice as likely as cis people (9%) to be searched by police, and this jumped to 25% when considering trans people of color (25%) and even higher for trans women of color (36%). Thirty-six percent of trans respondents noted that police officers had accused them of a crime that they did not commit, 72% reported hostile attitudes from police in their interactions with them, and 16% of trans women of color reported being subjected to sexual harassment when they interacted with police. Twenty-two percent of respondents in the 2016 United States Transgender Survey (USTS) firmly believed they had been arrested simply because they were transgender. In the same study, 49% of respondents stated that police misgendered them, 20% said they were verbally harassed by police, 19% were asked inappropriate questions about medical transition by police, 11% were assumed to be sex workers by police, 4% were attacked physically, 3% were assaulted sexually, and 1% were forced to engage in sex to avoid being arrested by police. These forms of misconduct clearly indicate a dire need for significant policing reforms.

Trans people continue to be regularly subjected to horrific forms of violence, including murder. Recent research on this suggests that a trans person is killed once every 3 days. Staggeringly, though, this is just an estimate—there exists no process by which the numbers of transgender people killed are officially recorded. Adding to this situation is the frequent misgendering of the victims in the media by police officers investigating the murders, and this is often just one harm in the course of what are often gross mishandlings of the investigations into the deaths of trans people around the world. When trans people survive violent attacks, they are often charged with assault and sometimes murder, even

when they were acting in self-defense. For instance, in 2006, the New Jersey 7, a group of lesbian, gender-nonconforming women, were physically assaulted and threatened with rape by strangers on the street, and when they defended themselves, they were charged with "gang assault" and sentenced to 11 years in prison until a campaign gained an acquittal, retrials, and shorter sentences. These and other forms of discrimination make all other transgender people generally, and particularly trans women of color, feel profoundly unsafe in the presence of the general public and police officers.

One of the core policing issues affecting the lives of trans women currently is the police profiling of trans women as sex workers. Academics and commentators have noted that trans women, particularly those of color, are disproportionately profiled by police as sex workers when they are in public spaces. They are often stopped, searched, and arrested for having condoms on their person—possessing condoms is interpreted by police as being engaged in sex work, even when this is not the case. This process has been dubbed "walking while trans," and advocates note that it is not just the highly discriminatory policing practices that are harmful. For instance, some trans women have reported that police asked them to remove their pants or skirts in order to satisfy police curiosity about what genitals they have under their clothing. Although this is degrading enough, their sexual health may suffer over the long term when they restrict their use of condoms simply because they do not carry condoms with them for fear of arrest. These circumstances are further exacerbated by lack of steady income; trans people are often denied full-time work and, therefore, often end up working in "underground" occupations related to drug and sex work economies, including the selling of black market hormones.

The research discussed above shows that the experiences of trans people with police are, typically, profoundly negative and substantially harmful. At the same time, there are positive initiatives attempting to improve the relationships between queer communities and police. For instance, many police organizations now host LGBTQIA+ police liaison programs that seek to provide queer and trans folks with support and advice about incidents they experience and how they might report to police. The extent to which these initiatives are positively influencing how police interact with trans people is still unknown at this stage. An audit of police policies supporting transgender people around the United States concluded that policies and training must be strengthened considerably—no police department audited met the criteria required to protect and serve trans people.

Pornography

Trans pornography broadly describes written, spoken, and visual material relating to trans people and transsexualities. Trans pornography exists within a vast and heterogenous network of intimate labors practiced by trans people that includes video pornography, street-based prostitution, escorting, camming, phone sex, erotic photography, and erotic literature. No matter the industry in question, all trans sex work exists within a public sphere where the representation of trans and gender-nonconforming people has been restricted

to reductive and dehumanizing stereotypes. This also articulates the terms and conditions of production for trans pornography and trans sex work more generally: Trans and gender-nonconforming people have had to brand themselves under the designation of slurs and the language of sexual fetishization in order to navigate sex work industries and porn production (with the exception of select trans women porn performers whose sex change surgeries enabled them to perform, as with Ajita Wilson, in heterosexual porn and erotic art films). While trans sex workers and actors have had to face public stereotypes in order to achieve relative industry success, all genres of trans porn offer complex sites of identification that unsettle dominant concepts of what *trans* is, what *trans* does, and, crucially, how *trans* fucks.

Trans pornography is an important topic of interest in that (1) pornography, and sex work more generally, receives scant consideration in academic settings despite constituting a major sector of economic and cultural production; (2) trans sex work and pornography have provided substantial alternatives to wage labor employment opportunities, historically denied from openly or visibly trans people, especially trans women and femmes; and (3) trans porn actors and sex workers have been increasingly targeted by legislation aimed to prevent sex trafficking, rendering them more vulnerable to violence with a diminished capacity to seek support or protection. In the United States, trans sex work and pornography has been circumscribed by legislation from the Crimes Against Nature (CAN) laws to the most recent Fight Online Sex Trafficking Act (FOSTA) and the Stop Enabling Sex Traffickers Act (SESTA), which both passed in the House of Representatives and Senate, respectively, on April 11, 2018. FOSTA/SESTA worked together to criminalize online sites that host content linked to sex trafficking or that "knowingly assist, support, or facilitate sex trafficking." As many trans sex workers and actors have stated, the effect of this legislation has been detrimental to the relative autonomy, safety, and livelihood of people who do sex work, especially Black and trans women.

Although the encyclopedic genre of writing calls for a neutral standpoint, approaching trans pornography from a "neutral" position remains fraught at a time when legislation in the United States and across the globe is actively harming sex workers. Along with the criminalization of sex work, the government-backed closure of major webpages and advertisement hosting sites (e.g., with Backpage and MegaPersonals) eliminates resources where service providers could screen potential clientele and subjects trans sex workers to increased visibility that directly relates to increased rates of violence against trans sex workers, particularly Black and brown trans sex workers. Taking these legal-material effects into account alongside the ongoing murder of sex-working trans women of color makes it unclear whether a "neutral standpoint" is imaginable, let alone ethical. In turn, this entry prioritizes the material conditions and concerns of trans porn actors and sex workers. This entry presents an overview of early visual representations of trans desire that provided the ground for the global commercialization of trans pornography; this is followed by an outline of existing scholarly approaches to trans pornography. The entry concludes with suggestions for further research.

Early Visual Representations of Trans Desire

In discussing erotic or sexual representations of trans actors and sex workers, it is crucial to understand that trans identities have been largely restricted in the public sphere to sexual tropes, stereotypes, fetishes, and fantasies that, historically, are overrepresented in trans pornography and sex work. While this condition affects transmasculine, transfeminine, and nonbinary people in different ways, it provides a limited set of scripts (i.e., roles that trans people are assigned according to their embodied variance) that trans actors and sex workers respond to within their respective industries. This set of scripts works along at least two axes: On one hand, a performer's racial identity is read in relation to erotic viability within the sex industry (e.g., the overassociation of Black and brown trans sex workers with street-based prostitution), and on the other hand, the perceived dichotomy between a performer's gender presentation and their genitals animates their identity within a predominantly cisgender, male-owned porn industry (e.g., ladyboy, shemale, chick-with-a-dick, jockpussy). In other words, while trans people's own engagement with their bodies and voices has historically been

underrepresented in popular media and academic accounts, the sexualization of their bodies has been overrepresented—an overrepresentation as racialized as it is sexualized.

Porn industry executives and academics date a major shift in trans video pornography in the early 1990s, but trans pornography had long existed in other formats across the 20th century. Stag films from the early 20th century, early predecessors to contemporary video pornography, portray people who crossdress for or during sex acts. While stag film has been discussed in relation to early gay cinema, the prevalence of crossdressing within this cinema warrants a closer engagement with these objects as predecessors not only to gay cinema but also to trans pornography writ large. By conceiving of crossdressing as an extension of homosexuality rather than as a practice of transsexuality or transvestism, these accounts of early cinema contribute to a historical erasure of trans people and their desires rather than considering the films as early visual representations of trans sex work and trans porn more generally.

In addition to pornographic films, trans pornography has long existed in pictorial and written forms. The language of erotic crossdressing abounds in periodicals and pamphlets across the 20th century that image, imagine, and write trans sexualities onto the page much earlier than academic discourse has alleged. If pornography is defined as material produced for the arousal and stimulation, *Female Mimics International, LadyLike*, and *Transvestia* exemplify written and illustrated publications in which trans bodies and sexualities, especially those of trans femmes and trans women, have been in circulation before the 1990s. These publications provide myriad opportunities to more closely study trans pornography in print as well as the ways that trans sex work industries operated in relation to print culture. Many of these periodicals offer interviews with, or writings by, the featured performers. They also offer extensive source material to consider the racial, ethnic, and geographic dimensions to the multitude of names, slurs, and terms used to refer to trans women sex workers and trans performers within sex work industries. Only in 2020 have major porn studios that produce and advertise trans pornography considered removing the slurs and terms of sexual fetishization from their marketing materials. Executives within the porn industry maintain that to eliminate the use of slurs would sharply reduce profits.

Within the pornography industry in the United States, trans pornography gained considerable visibility through the first awards show to feature trans actors. Because trans porn actors were frequently blacklisted within the mainstream porn world due to stereotypes around HIV and AIDS, trans porn actors had no opportunity to be professionally acknowledged for their work, unlike cisgender porn actors. In 2008, Grooby Productions began The Tranny Awards, where an online panel of judges recognized trans porn performers; the awards show changed its name from The Tranny Awards to the Transgender Erotica Awards in 2014.

Theoretical Approaches to Trans Pornography

Trans pornography cannot be defined in terms of sexual orientation in the same way that the contemporary porn industry has been commercialized. There is straight, gay, and bi porn within trans porn, making it difficult to continue to define sexuality as simply a matter of object choice (i.e., a person's sexuality is defined according to the object they are attracted to), which is how the majority of straight porn sells filmed sex. A major subcategory of trans pornography plays with how transsexualities destabilize this notion of sexuality. In this brand of trans porn, the actor's trans identity is at first unsuspected and they are eroticized as cisgender objects of desire before the staged "surprise" of their trans status and ensuing sex acts. This has also created difficulties in defining trans pornography due to its incompatibility with the heterosexual/homosexual framing of desire: There is lesbian trans porn, straight trans porn, trans porn between trans women, trans porn between trans men and trans women, and so on. In short, trans porn is not one thing in terms of gender, orientation, or practice—it opens a fission of desire(s).

Most scholarly writing on trans pornography comes through feminist, queer, and women's studies and film, cinema, and media studies, offering evaluations of trans pornographic content through qualitative judgments based on the porn's formal aspects: the aesthetics, narrative, scenario, sex acts of the scene with scarce sustained interest in the material

conditions concerning the production of trans pornography, and the power relations at play between actors, producers, investors, consumers, and distributors—although some recent scholarship has begun to address these material concerns. To address the categorical slipperiness that trans porn produces (i.e., how trans desire is uncontainable in standard straight/gay models of porn), academic writing on porn has divided trans pornography into two distinct ideologies: (a) the commercialization of trans pornography among self-identified heterosexual men that involved trans women and transfeminine people and (b) the struggle that trans individuals pursue to achieve greater visibility. In scholarship, the second ideology is the most common approach to trans pornography. In this camp, trans porn is regarded as an object that holds out a possibility for more comprehensive awareness, representation, pedagogy, and cultural production in the portrayal of nonnormative embodiments and sexualities. This branch of trans pornography also includes most pornography that is produced and marketed within the global North as feminist and/or queer pornography, and within the United States, it remains filmed in smaller studios located in a handful of cities such as San Francisco and Los Angeles or shot in the privacy of one's living space. Much of this pornography is made in relative economic independence from sex work industries more broadly, meaning that its production tends toward user-submitted, DIY, or professional-amateur (pro-am) "queer" porn. Two important things worth mentioning about this subgenre of independent pornography: It does not exclusively rely on an extant consumer base for purchase or production; because its content is produced independent of sales, this subgenre of trans porn is assumed to be more self-directed than mainstream pornography due to its nonreliance on an extant consumer base for purchase and subsistence. This subset of trans pornography has been written about in terms of feminism, pedagogy, and sexual empowerment—strands of criticism that are rarely considered in relation to trans porn of the first grouping, namely, studio-based porn featuring trans women.

This second camp of trans pornography has received the least attention in scholarly discourse. What has been written about trans porn featuring trans women (as well as femme sex workers of trans experience more generally) has privileged the perspective of consumers of trans femme porn and elided the perspectives of trans femme sex workers themselves. This elision also calls into question the role that "respectability politics" (i.e., an ideology that ascribes or denies value to people based on their perceived proximity to ideals or social codes held as respectable) continues to play in academic discourse on and disciplinary approaches to trans porn. The dearth of extended academic research into this branch of trans porn is all the more telling given that trans porn involving trans women for a largely male audience remains one of the most popular, and lucrative, genres of all—not just trans—pornography. In a 2015 interview with the *International Business Times*, Adam Grayson, the former vice president of Evil Angel, an American porn production company and distributor, stated that nothing comes close to trans pornography in terms of revenue per scene or movie. Porn studios have turned to trans porn in addition to other genres of fetish porn to sustain revenue throughout consumer and production shifts in the porn industry. The sheer popularity of this subgenre of trans porn warrants more attentive and engaging research.

Areas for Further Research

The expansiveness of transsexualities in pornography brushes up against normative understandings of sexuality as a simple matter of object choice. As suggested above, trans pornography provides manifold opportunities to reconsider orientations and practices of desire untethered from earlier models of sexuality. The diverse terms used to identify, market, and eroticize trans sex work and porn also offer an extensive catalogue with which to consider the racial/ethnic/geographic dimensions to trans porn production and trans sex work more generally. While the majority of academic writing on trans pornography centers on North America and specifically the Unites States, Thailand and Brazil remain international epicenters of trans porn production. Much work remains to be done on the intimate connections between empire, tourism, military occupation, and the establishment of trans sex work economies and porn industries and how trans sex workers and actors navigate and survive in specific, local sex work industries.

Related to the connections between empire and trans porn production, there is a need for more

research to address the relationships between state legislation and public discourses that further stigmatize and oppress trans actors and sex workers (and contribute to stigmatization of trans people writ large). As trans porn actor and activist Valentina Mia states in her contribution to the special issue on porn of *Transgender Studies Quarterly*, "[There is an] irony that the very society that effectively forced me into sex work is doing everything it can to ensure I never escape sex work by further oppressing me with legislation aimed at protecting women who were forced into sex work . . . the State wants to trap me in a cycle of poverty and oppression." SESTA/FOSTA exemplify one of the most recent instances of legislation that endangers sex workers and porn actors in the United States. However, in order for this research to not reenact the same omissions and elisions around trans sex work and porn that occur with previous scholarship, the lives, material concerns, and embodied knowledge of trans porn actors and trans sex workers must be central to any further research.

Pose (TV show)

Pose is a television drama series set in 1980s to 1990s New York City ball culture. *Pose* premiered June 3, 2018, on the premium cable channel FX. The series quickly gained critical acclaim for, among other things, featuring the largest cast of out transgender series regulars ever seen on television. This entry aims to situate the series in the history of trans representation and articulate the uniqueness of its contribution to the contemporary trans mediascape.

In 1990, Jennie Livingston's documentary *Paris Is Burning* opened up the world of 1980s New York City ball culture to previously unknowing audiences—queer, trans, straight, and cis. Ball culture (or "ballroom") is a Black and Latinx queer culture, started in 1920s New York City and now a global phenomenon, where Houses (or chosen families) vogue and otherwise walk runways in various categories for trophies. In 1989, Willi Ninja, who is featured in *Paris Is Burning,* performed in Malcolm McLaren's "Deep in Vogue" music video, which sampled the unfinished film. Within a year, ball culture's poses could be widely viewed on U.S. television in Madonna's music video for her hit "Vogue." Livingston's documentary crosscuts between cinéma vérité footage of balls and interviews with fathers, mothers, and children of ballroom at their homes, backstage, and on the street. Across the 1990s, scholars bell hooks, Judith Butler, and Jay Prosser engaged in a lively debate, each taking the film as paradigmatic of their key contentions about Blackness, queerness, and transness, respectively. The film's notoriety unfurled well beyond academe. As Janet Mock, one of *Pose*'s writers, producers, and directors, stated in a May 2018 *New York Times* interview, "All of us—any queer or trans person—knows *Paris is Burning*" (Galanes, 2018). For viewers knowledgeable of *Paris Is Burning*, there are familiar elements to *Pose*'s characters and mise-en-scène. The Season 2 plot, devoted to Candy Ferocity's murder at the hands of a john, also chillingly recalls Venus Xtravaganza's own in *Paris*. However, the documentary is never directly referenced. Mock describes *Pose* and *Paris* as existing in parallel universes. And the series addresses many of the critiques the 1990 film received.

Whereas *Paris Is Burning* is widely believed, following hooks's critique, to make a spectacle of Black bodies and rituals, *Pose* uses the serialization of television to narrativize the appropriation of Black queer culture as well as to develop characters and plots such that any given ball performance is inseparable from what that character or House is going through financially, medically, romantically, and so on. When Angel Evangelista, who aspires to model professionally, cannot afford the professional photos required for a modeling application and is coerced by the photographer into posing for additional illicit photos in compensation, the camera refuses his fetishizing gaze, training itself instead on Angel's face such that the horror of the situation cannot be denied. In scenes and plots such as this, the series also contextualizes what hooks characterizes as *Paris*'s subjects' fetishization of white femininity, establishing how Black trans women's embrace of certain aesthetics is not simply parodic but often a means of gender self-expression as well as at times a necessary measure in a capitalist culture. In doing as much, the series serves an important pedagogical function, teaching viewers that some ballroom queens are gay men in drag, while others are trans women (a far from minor nuance neglected by hooks), and demonstrating how gay and trans people build queer families together, supporting each other from financial and medial crises (including HIV/AIDS) when their families of origin will not.

Likewise, whereas Butler values *Paris*'s trans-feminine subjects' transgression of the gender binary, dismissing some of these same subjects' articulations of desires for husbands and homes as heteronormative—a valuation which, as Prosser points out, lifts up exactly that which gets Venus Xtravaganza killed—*Pose* understands passing as a "poetic of relation." As micha cárdenas writes in her essay, "Shifting Futures: Digital Trans of Color Praxis," passing for trans women of color is not simply a matter of visibility or invisibility but attaining a particular form of visibility such that one remains safe as one moves through racist, transphobic spaces, so as to be able to shift into another form of visibility and advocate for trans and gender-nonconforming folks as an openly trans woman in other spaces and at other times. The serialized television format allows *Pose* to explore not only moments where characters get "clocked" (i.e., are unwillingly outed as trans), as well as the violence that frequently ensues, but also the moments of familial mourning, resistance, and celebration that follow. The power of the Evangelistas stealing back the coerced photos taken of their sister Angel; Candy's funeral, in which Candy herself fantastically speaks back to family, given and chosen, from the beyond; and the women's road trip to the beach, where HIV-positive mother Blanca experiences a whirlwind romance, is particularly remarkable, considering all these characters and those who inspired their writing have been through.

Critical to *Pose*'s success in such matters, and a substantial difference between the series and *Paris,* as well as other trans media series today, are the contributions of Black trans and queer people to the creative team. Much has been made of white lesbian Jennie Livingston's direction of *Paris Is Burning,* and trans media studies scholars have critiqued the most popular of productions that proliferate in our "trans tipping point" present, including Hollywood's tendency to cast cis actors in trans parts, to tell the same tragic and fetishistic stories time and again, and to favor rich white trans characters over poor Black and Latinx characters. *Pose,* in contrast, centralizes Black and Latinx trans characters and casts Black and Latinx trans actors in these parts. Trans series regulars include MJ Rodriguez (Blanca Evangelista), Indya Moore (Angel Evangelista), Dominique Jackson (Elektra Abundance), Angelica Ross (Candy Ferocity), and Hailie Sahar (Lulu Ferocity). Trans people also contribute substantially to the production team. *Pose* is run by *Glee* and *American Horror Story* collaborators Ryan Murphy and Brad Falchuk alongside TV newcomer Steven Canals. After reading journalist Janet Mock's autobiography *Redefining Realness* (2014) about growing up as a mixed Black trans girl in Hawaii, Murphy invited Mock to write for *Pose*. Mock cowrote the pilot with Falchuk and was soon promoted to producer and asked to direct Episode 6, becoming the first out Black trans woman to direct for television. Our Lady J also writes for the series. And the series consults and employees Black and Latinx trans and queer folks from the NYC ball culture, including the late Hector Xtravaganza, who served as a ball consultant to Season 1, and Twiggy Pucci Garcon, who served as a ball consultant on Season 1 and the runway choreographer on Season 2.

Ultimately, *Pose* may be a show about the past, but it also makes the reality, and the stakes, of continuing to live and work and pose in the present all the more luminous.

Poverty

There is no typical experience of being trans in the United States, and the trans community is diverse in both its demographics and its experiences. That said, research is consistent in finding that many trans people experience poverty and economic insecurity, and they do so at rates much higher than the general population. According to a 2019 analysis of federal data from the Centers for Disease Control and Prevention (CDC), an estimated 30% of trans people live in poverty, compared to 16% of cis heterosexual people in the United States.

This entry provides a U.S.-specific overview of how poverty is typically measured, rates of poverty among trans people, some of the many causes of trans people's higher rates of economic insecurity, and questions that remain. While available data provide important insight into the stark hardships faced by trans people, it remains crucial that the lived experiences of trans people—particularly those living in poverty—not be reduced solely to statistics and that the complexity and resiliency of their lives are recognized.

How Is Poverty Measured?

Just as there is no singular trans experience, there is no singular experience of poverty. What it means to live in poverty can vary greatly from person to person and region to region, as well as across different racial or ethnic backgrounds, genders, and more. For example, the 2015 U.S. Transgender Survey (USTS) shows that 24% of white trans people were living in poverty in 2015, compared to 38% of Black trans people and 43% of Latino/a trans people.

While experiences of poverty vary widely, measurements of poverty in the United States are often based on a person's (or family's) income. One common measurement of poverty is the "poverty threshold," which is calculated by the U.S. Census Bureau and updated each year. This measure estimates the minimum income required for a person's (or family's) basic necessities, such as food and housing. Individuals or families with annual incomes at or below the poverty threshold in a given year are considered to be "living in poverty." In 2018, the poverty threshold was roughly $13,000 for an individual and $25,000 per year for a family of four. By this measure, over 38 million people in the United States, or 11.8% of the U.S. population, were living in poverty in 2018.

The poverty threshold is also used by other government departments and by federal, state, and local programs to determine eligibility for many important programs and services, such as housing assistance, food assistance, and much more. As a result, the poverty threshold is an important

measure for demonstrating the magnitude of how many people experience poverty in the United States both today and over time, as well as for helping people experiencing poverty to gain access to much-needed resources and support.

While the poverty threshold is the most commonly used measure of poverty today, there are many other ways to measure poverty. Such measures, like "persistent poverty" (measured at the county rather than individual level, meaning 20% or more of a county's population has been in poverty for the past 30 years), as well as other dimensions like underemployment, housing insecurity, and high health care costs, can all illustrate different aspects or experiences of poverty.

Trans People Are More Likely to Live in Poverty

As of 2020, the U.S. Census does not ask about sexual orientation or gender identity, and as a result, there are limited data available about the trans population (and the LGBTQIA+ population more broadly). However, an increasing number of large surveys include questions about trans identity, gender identity, and gender expression, and the depth of qualitative research about trans people's lives has grown immensely. As a result, it is increasingly possible to make comparisons with the general population (Table 1). What consistently emerges from this research is that trans people are roughly twice as likely as cis people or the general population to live in poverty.

Among nationally representative surveys, a growing number of states have included gender identity questions on their Behavioral Risk Factor Surveillance System (BRFSS) surveys, conducted by the federal CDC. These data are particularly valuable because the BRFSS surveys are designed to be representative of a state's population as a whole, which allows researchers to make conclusions about that entire population rather than only about the individuals included in the survey. An analysis by Halley P. Crissman and colleagues using BRFSS data collected from 19 states and Guam found that trans people were more likely to live below the poverty line (26.0%) compared to cis people (15.5%). A more recent analysis by M. V. Lee Badgett and colleagues of BRFSS data from 2014 to 2017 collected in 35 states similarly found that 29.4% of trans people lived in poverty compared to 15.7% of cis heterosexual people, with little difference in poverty rates for trans people in rural and urban communities. There were no statistically significant differences in rates of poverty between trans men and trans women.

While the number of nationally representative surveys that include questions about gender identity remains low, community-based surveys have provided important insight into the lives of trans people for many years. Among them, the 2015 United States Transgender Survey (USTS) is the largest survey of trans people in the United States with nearly 28,000 respondents. The results are stark in terms of poverty for trans people: 29% of trans people were living in poverty in 2015 compared to a national rate at the time of 14%.

In sum, across many types of research, trans people in the United States are more likely to be living in poverty, compared to both cis people and

Table 1 Poverty Rates of Trans People and Comparison Groups

	Rates of Poverty Among . . .	
Data Source	*Trans People*	*Comparison Group*
2014–2017 BRFSS (35 states)	29%	15.7% cis heterosexual people
2014 BRFSS (19 states + Guam)	26%	15.5% cis people
2015 U.S. Transgender Survey (online; 50 states, D.C., + 3 territories)	29%	14% general population

the general U.S. population. Even when controlling for factors like age, race and ethnicity, education level, having children, and more, research (such as the analysis by Badgett et al.) finds that trans people are more likely to live in poverty than are cis people. These disparities are often even greater for trans people of color, as discussed in the next section.

Marginalized Groups Within the Trans Community Experience Poverty at Even Higher Rates

Being trans is one facet of identity that affects the likelihood of living in poverty. However, it is crucial that discussions of trans people's economic insecurity and rates of poverty also examine their multiple other identities—including gender identity as women, men, and/or nonbinary; race and ethnicity; disability status; age; HIV status; and other characteristics—as each of these may also affect both the likelihood and the experience of poverty.

In the United States, poverty rates vary substantially by populations, revealing how different dimensions of identity affect the likelihood that a person might experience poverty. For example, women are generally more likely than men to experience poverty: In 2018, the Census Bureau reported that women ages 18 to 64 had a higher rate of poverty (12.3%) compared with men of the same age (9%). Black and Hispanic people in the United States report higher rates of poverty (21% and 18%, respectively) compared with white and Asian people (8% and 10%, respectively).

Among trans people, these same patterns often recur and sometimes with unique interactions. For example, while people of color in the United States in general experience higher rates of poverty than the general population, the rates of poverty for trans people of color are significantly higher than both their cis peers of color and white trans people. Badgett and colleagues' analysis of the 2014–2017 BRFSS data showed that nearly half (48.5%) of Hispanic trans people and 38% of Black trans people were living in poverty, compared with 18.6% of white trans people. Similarly, in the 2015 USTS, trans people of color report even higher rates of extreme poverty: 43% of Latino/a trans respondents were living in poverty, as were 41% of American Indian trans or two-spirit respondents, 40% of multiracial respondents, and 38% of Black respondents.

Additionally, the USTS shows that trans people with disabilities report significantly higher rates of poverty—nearly 45% of trans people with disabilities were living in poverty at the time of the survey—a trend mirrored among people with disabilities and the general population. The same survey showed that undocumented trans people and those working in underground or survival economies such as sex work reported incredibly high rates of poverty (69% and 62%, respectively), as did those living with HIV (51%).

With respect to gender, in Crissman and colleagues' analysis of nationally representative 2014 BRFSS data, poverty rates did not statistically differ between trans women and cis women. Badgett and colleagues' analysis of 2014–2017 BRFSS data similarly finds that rates of poverty among trans people are most similar to those of cis bisexual women. These findings suggest that the overall higher rates of poverty among trans people may be especially related to gender.

Potential Drivers of Higher Rates of Poverty for Trans People

Thus, trans people are clearly more likely to experience poverty. Research also shows that experiencing discrimination—which trans people routinely do, including in employment—is linked to higher rates of job loss, poverty, and overall economic insecurity. Experiencing discrimination can also have many negative impacts on both physical and mental health, as well as access to health care, all of which in turn may lead to additional economic insecurity. Beyond demographic factors like race, disability, and gender, other factors that likely drive higher rates of poverty for trans people include obstacles to obtaining accurate identity documents, a lack of consistent and explicit protections against discrimination, and heightened criminalization. A study by the Sylvia Rivera Law Project summarized the disproportionate poverty experienced by trans people, especially trans people of color, as being deeply rooted in the vast and wide-ranging experiences of discrimination experienced by trans people in nearly every aspect of life.

Employment Discrimination

Employment discrimination is a fact of life for many trans people, and it can have serious economic consequences. Workplace discrimination can take many forms, including being passed over for a promotion or denied a raise, being fired, or not being hired in the first place. Each of these forms of discrimination has a direct economic impact: Not being promoted keeps a person's income stagnant, while being fired or not hired prevents a person from earning income from that source altogether. Such discrimination can also lead to underemployment, potentially long periods of unemployment, and slower career progression, all of which again affect earnings and economic stability. In the 2015 USTS, nearly one in three (30%) trans people have ever lost a job because of their gender identity or expression, and more than one in four (27%) trans people who had or applied for a job in the past year reported some form of employment discrimination in the past year alone, including being fired, denied a promotion, or not hired specifically because of their gender identity or expression. But as of January 2020, 29 U.S. states still lack explicit state laws prohibiting discrimination against trans workers, according to the Movement Advancement Project (MAP), an LGBTQ think tank that tracks policies.

Unemployment

Unemployment is also a fact of life for many trans people. In the 2015 USTS, trans respondents reported an unemployment rate of 15%, compared with just 5% for the general U.S. population at the time of the survey. The rate was even higher for trans people of color (20%) and trans people with disabilities (24%). Even short periods of unemployment can lead to longer-term economic consequences, as gaps in a person's work history can make it more difficult to be hired for a new job.

Health Care Access

Health care access is a critical need for all people, including trans people. Trans people often have unique medical needs and experience many disparities in both health and health care, but a higher likelihood of employment discrimination, unemployment, and underemployment all also mean a lower likelihood of being able to access employer-provided health insurance. Indeed, in the 2015 USTS, 14% of trans adults were uninsured, compared to 11% of all U.S. adults at the time of the survey.

Even when trans people can access health insurance, insurers (including state and federal programs such as Medicaid) may not cover medically necessary gender-affirming care, and providers (such as hospitals, doctors, or pharmacists) may also discriminate against trans patients. In the 2015 USTS, 33% of trans people who have seen a health care provider in the past year alone report having at least one negative experience related to being trans, including being refused needed medical care or being verbally or physically harassed. But as of January 2020, according to MAP, 28 states still allow insurers to explicitly refuse to cover trans-related care, and 32 states lack laws that prohibit gender identity discrimination in health care more broadly.

Identity Documents

Identity documents are a vital but often overlooked part of daily life, especially so when seeking a job. Trans workers may not have identity documents that accurately reflect their name or gender identity, and this can be a barrier to seeking—and getting—a job. For example, presenting a passport or driver's license with an old name or incorrect gender marker to a potential employer may "out" the person as trans, putting them at risk for discrimination or losing a job offer. Trans people who lack accurate identity documents might be further reluctant to seek public assistance, job training, or other benefits because of the fear of discrimination when having to present their documents to access those benefits.

According to the 2015 USTS, only 30% of trans people have been able to legally change their name, and only 11% of trans people have been able to update all their identity documents to match both their name and gender identity. Among trans people who have not been able to update their documents, in the past year alone, nearly one third (32%) have had a negative experience when showing their ID, such as being harassed, attacked, or denied services. Despite this, a majority of states make it both challenging and expensive for trans people to update their identity documents. For example, as of January 2020, MAP reports that

34 states have some type of requirement that people must publish in a local newspaper or otherwise publicly announce that they are attempting to legally change their name. This costs both money and time and further exposes trans people to potential harassment or discrimination. Additionally, 18 states impose burdensome requirements before allowing people to update the gender marker on their driver's license, including in some cases invasive and inappropriate requirements such as providing medical records or proof of medical procedures. Particularly for trans people living in poverty or without health insurance, accessing such medical care may be out of financial reach—and not all trans people, irrespective of income, want the type of procedures such laws require.

Education

Education is often positively associated with increases in income. Yet for trans people, data suggest a more complicated relationship. For example, trans people in the 2015 USTS are significantly more likely than the general population to have a college degree but are also significantly more likely to live in poverty and be unemployed. Similarly, in a 2007 study titled "A Study of Transgender Adults and Their Non-Transgender Adult Siblings on Demographic Characteristics, Social Support, and Experiences of Violence," by Rhonda Factor and Esther Rothblum, researchers found that trans people were more highly educated than their cis siblings but did not have higher incomes.

This more complicated relationship between education and income may be especially true for trans people of color. In a 2008 Transgender Law Center survey of trans Californians, education was correlated with income, but race itself was not correlated with income. However, access to higher education and education completion rates in the United States generally vary greatly based on race and ethnicity, so the protective factors of education may be difficult for people of color to access.

Criminalization

Trans people, especially trans people of color, are disproportionately targeted by the criminal justice system. Time spent in incarceration is time lost for earning income, building job skills, or advancing in a career, in addition to the human costs. Such criminalization is also often a substantial barrier (in the form of a criminal record) to future employment, housing, and even being able to update identity documents, all further exacerbating risk of poverty. Additionally, people living in poverty—particularly when they are also facing routine and persistent discrimination and other obstacles in employment, housing, and more—are more likely to engage in survival economies, such as sex work, to make ends meet. Engaging in underground economies, especially coupled with police profiling and harassment, again means that trans people and especially trans people of color and trans women are more likely to be subjected to the criminal justice system in a cycle of incarceration and poverty.

Areas for Additional Research

Many questions remain for research on poverty and the trans community. For example, are there different experiences of poverty or economic insecurity based on gender identity (e.g., trans women vs. trans men vs. nonbinary people)? What additional risk factors exist for poverty for trans people? What protective measures might exist? Given that trans youth are more often coming out or transitioning at younger ages, with increasing access to health care and affirming families and communities, will patterns of trans poverty change? Are they already changing? What interventions are most successful for addressing the harms to and experiences of trans people specifically from poverty and economic insecurity?

It is clear from existing research that trans people are more likely to experience poverty, with best available data currently suggesting that roughly twice as many trans people in the United States are living in poverty, compared with both cis people and the general U.S. population. These rates of poverty are even higher for marginalized groups with the trans community, such as trans people of color, trans–disabled people, and trans people living with HIV. It is imperative that more work be done to better understand the causes and impacts of these disparities, as well as to identify and implement ways to improve trans people's lives and economic security.

Pregnancy

Many trans people wish to be parents. Although there are a variety of ways to achieve parenthood, many trans men are born with the reproductive anatomy that enables them to become pregnant and give birth, and some choose to do so. Shifting sociocultural and medical attitudes that facilitate recognition of trans men's desire to pursue pregnancy have increased their choices. There are certain health-based and socioemotional considerations to be taken into account for trans men who wish to become pregnant. Prior to pursuing pregnancy, trans men may have engaged in interventions to achieve gender affirmation or transition. However, some of these interventions can significantly affect a trans man's ability to become pregnant. As such, it is vital that trans men are informed of the long-term effects of interventions on their ability to become pregnant as early in their gender affirmation journey as possible, in order to make informed decisions regarding preservation of fertility and future parenthood. Additionally, the psychological impact of pausing gender-affirming treatments and the dysphoria associated with the pregnant body are experiences that may lead to distress and the need for support on professional, community, and personal levels.

From a health-based perspective, testosterone therapy leads to the disruption of ovulation, and as a result, fertility is significantly affected. Although trans men can still become pregnant when on hormone therapy, testosterone is teratogenic to fetuses, so hormone therapy must cease before attempting to become pregnant. Regular ovulation can return if hormone therapy stops, although the timing of this can vary from weeks to months. Whereas many trans men conceive and give birth after ceasing hormone therapy, long-term effects on ovarian functioning are not fully known. Infertility has been reported among trans men; however, infertility does, of course, also occur in the broader community. Research is needed on the causes of infertility in trans men.

Making the decision to discontinue hormone therapy for an indeterminate period while trying to conceive can be complicated, eliciting significant dysphoria and distress. There is evidence that the preconception and perinatal periods pose many psychological challenges for trans men who pursue pregnancy. Furthermore, for trans men who have undergone surgical gender affirmation, such as the removal of their uterus, ovaries, or a surgical

modification of their genitalia, gestational pregnancy will no longer be an option. However, trans men can opt for fertility-preserving procedures, such as harvesting and freezing eggs, prior to a hysterectomy, which can later be used by a partner or surrogate. For trans men with an intact uterus and ovaries who have partners with the ability to produce sperm, conception can be relatively simple. However, for those who have partners with a uterus or for trans men choosing to parent solo, assistance in the form of sperm donation is required to conceive.

Accessing general health care is very challenging for the trans community. However, lack of trans-relevant clinical knowledge and cultural competency among medical professionals specializing in reproductive health means that many trans men report experiencing significantly subpar care in these settings. Many trans men report experiencing open discrimination, transphobic treatment from staff, and, in some cases, outright refusal of treatment from fertility clinics, even when such refusal of service contravenes laws. Exclusion from these services means that engagement with formal assisted fertility institutions can be deeply problematic and marginalizing for this community, with long-term negative emotional repercussions for the prospective parent. As such, many trans men opt to pursue less formal methods to achieve pregnancy, by finding a sperm donor through informal or friendship channels and self-inseminating. Those trans men who choose and are able to pursue informal reproductive assistance generally describe it as a positive and affirming experience.

For trans men who are successful in becoming pregnant, the joy of potential parenthood can be complicated by the loss of the masculinizing effect of gender-affirming therapies, combined with changes associated with the pregnant body, and can have a significant impact on mental health. For trans men who have not had top surgery, the growing chest can be particularly distressing, as "breasts" are strongly associated with womanhood. The pregnant chest and experiences of chest feeding after childbirth can lead to intense experiences of dysphoria, depression, and anxiety. Binding the pregnant or feeding chest may not be a viable option due to feelings of discomfort, and as a result, many trans men choose to isolate themselves during the perinatal period in order to avoid negative social reactions to their bodies. Accessing birth centers and medical appointments can be deeply confronting during a vulnerable time for parents, as these services are often not inclusive toward pregnant trans men, reflecting transphobia at a structural level.

The pregnant body is viewed as an archetypal representation of femininity, and therefore the pregnant man disrupts assumptions around representations of gender and how it is performed. Those who diverge from these assumptions can be exposed to discrimination, marginalization, and social exclusion. Trans men make deeply considered, measured, and informed decisions in regard to pursuing pregnancy, a choice that can require much personal sacrifice. In doing so, they undertake a complex negotiation with their masculinity, challenge the fundamental connection of pregnancy with femininity, and engage with the material reality of the medical and biological aspects of pregnancy. Finally, for nonbinary people, navigating fertility and pregnancy can be even more fraught, as nonadherence to the dyadic concept of two genders, of "mother" and "father," further troubles one of the most tightly held societal archetypes: parenthood and the family, challenging notions of who gets to be "parent" and who gets to give birth. Further research into this area is sorely needed, particularly around fertility counseling and preservation, as well as educating health care professionals in how to care for and support this population in their pursuit of pregnancy.

Preventive Health Care

Preventive health care encompasses a range of services, including, but not limited to, primary and dental care, preventive services such as immunizations, and screenings for breast cancer, cervical health, colorectal cancer, and sexually transmitted infections. Use of preventive health care is thought to improve health. Lower use of preventive health care may partly explain poor health among trans populations compared to their cisgender (cis) peers. This entry discusses how access to preventive health care differs between trans and cis populations, summarizes the existing literature on preventive health care among trans populations, and describes key challenges and opportunities for future work.

Reasons for Differences in the Use of Preventive Health Care

Andersen's Behavioral Model theorizes that predisposing, enabling, and need-based factors shape an individual's decision to seek health care.

Predisposing factors include age, race, ethnicity, education, marital status, employment status, and health beliefs. Hispanic, Black, and Native American minority groups consistently use less care than white populations. People who did not attend college, those who are unemployed and unmarried or not partnered, and young adults are more likely to use less preventive care. Compared to the cisgender population, the trans population is younger, has lower educational attainment, and is more likely to be unemployed, never married or partnered, and nonwhite, which predisposes trans populations to use less preventive health care.

Additionally, the trans community has a culture of self-reliance rooted in a history of marginalization. Trans individuals experience high levels of discrimination within and outside the medical system. Health beliefs such as stigma and conspiracy beliefs decrease trans individuals' willingness to seek preventive care such as preexposure prophylaxis (PrEP) for HIV prevention.

Enabling factors include income, affordability of care, insurance, and availability of health-related information. Trans populations have lower incomes and lower rates of health insurance coverage than do cis populations, both of which are associated with less health utilization. Lack of affordable routine and transition-related care and gatekeeping—the use of rules and authority to limit access—decrease the availability of health-related information and access to care.

Need-based factors include health status and self-rated health. The Andersen model differentiates between perceived need for health services, or how people view and experience their own health, and evaluated need, or how professionals assess patients' health status and needs. Differences in perceived and evaluated need for care may also contribute to differences in health utilization. Trans individuals may be more likely to access care because of higher reported levels of poor self-rated health, multiple chronic conditions, and disabilities. In addition, health utilization may be higher among trans individuals who are accessing gender-affirming hormones or surgeries. However, trans individuals may be less likely to obtain screening for specific cancers because of confusion and misconceptions about risk. For example, trans individuals who were assigned female at birth may avoid screening for cervical cancer if they have gender-related distress associated with sex-specific organs. Additionally, providers may evaluate health needs differently. For example, clinicians may not understand how to apply cancer screening guidelines to trans patients, and trans people may be screened for HIV more often than cis people because they are more likely to identify as non-heterosexual.

Preventive Health Care Research

Evidence regarding preventive care use has relied on varied sources, including the Behavioral Risk Factor Surveillance System (BRFSS, a nationally

representative survey), the 2015 U.S. Transgender Survey (USTS, a large nonrepresentative survey), state or hospital surveys, electronic medical records, and administrative claims. Most preventive health research focuses on the adult trans population. The most frequently studied outcomes are primary care visits, cancer screenings, HIV screenings, and flu shots.

Preventive Care in Adults

The evidence on trans adults' use of preventive health care is inconclusive. Although nearly one dozen studies examined annual primary care visits, half the results suggested similar utilization among trans and cis groups, while the other half concluded that trans groups received fewer visits. This may be due to differences within the trans population, where male-to-female, female-to-male, and gender-nonconforming people had varying propensities to use preventive care.

Research on screening differences is more consistent. Studies consistently found trans adults received fewer breast, cervical, and colorectal cancer screenings and equal or more HIV screenings.

Preventive Care in Children and Adolescents

As of June 2020, only two studies have assessed preventive care use in trans youth, and both relied on data from high school respondents to the 2016 Minnesota student survey. Using different comparison groups, both studies concluded that trans students were less likely to receive primary care services or dental care than their cis peers. Higher levels of parent connectedness were linked with increased primary care and dental visits, confirming research that asserts family social support is a powerful contributor to resilience.

Preventive Care in Older Adults

Little research exists on trans older adults. A study of Medicare beneficiaries aged 65 and older found that gender-minority older adults were more likely to have annual wellness visits but had a similar likelihood of getting a flu shot or routine physical exam.

Key Challenges in Research

Two major issues make it difficult to understand why preventive care differs between trans and cis populations. The first issue is measurement. Within preventive care studies, how trans identity is defined and how comparator groups are selected are inconsistent. Some studies compared by current gender identity (e.g., transfeminine individuals vs. cis women), while others compared by sex assigned at birth (e.g., transfeminine individuals vs. cis males) or simply compared trans to cis populations. Additionally, studies using claims data relied on diagnoses codes to identify trans individuals, thus excluding trans people who are not out to their providers or do not use gender-affirming care.

The second issue is inference. Very few studies are representative. While studies that used BRFSS data could draw conclusions about the national population, these data excluded populations without telephones and the houseless and institutionalized. Published work on trans youth comes from a single state (Minnesota), and research on trans older adults is very limited.

Opportunities for Future Research

As we have seen, emerging research suggests trans populations use less preventive care than cis populations. Future research is needed to expand and deepen this body of work. Such research will be improved by access to better data. Several national surveys plan to add a gender identity question. Additionally, using administrative data and electronic health records will expand our understanding of health utilization in this population.

Second, research that links preventive care to reducing health disparities will have an important impact. For example, population-based surveys find trans populations have a higher burden of cardiovascular disease, but little is known about cardiac preventive care in these groups.

Third, future research on preventive care could go beyond how often trans people access care to include quality and the lived experience of that care. Future work can provide context about why individuals sought primary care, how they rated the quality of care, and how the care affected their short- and long-term health.

Finally, the role of mutable factors in the health care system in creating or narrowing gaps in utilization disparities is still poorly understood. Little is known about whether provision of gender-affirming care can expand access to primary and preventive

care by increasing touch points with the health care system and reducing institutional discrimination.

Preventive Screening

Preventive screening refers to health care services, such as tests or questionnaires, used to monitor an individual's health and prevent adverse outcomes. Generally, recommendations are based on the body parts a person has and the behaviors in which they engage. Because trans people experience disproportionate rates of certain health conditions, screening for these conditions is especially important.

Cancer Screening

Structural and behavioral factors put some LGBTQIA+ individuals at increased risk for some cancers. Cancer screening should be conducted in a culturally responsive manner and requires an accurate organ inventory (i.e., knowledge of which anatomical structures a person possesses) and thorough behavioral risk assessment.

Factors and General Recommendations

Fear of discrimination or past trauma within the health care system may account for lower rates of cancer screening and later diagnosis in some LGBTQIA+ people. Community-informed outreach about the importance of organ-based cancer screenings, peer support provided by trans health navigators, and increased use of self-administered screening tools are strategies found to improve cancer screening rates among trans people.

Behaviors, including substance use and sexual practices, also play a role in increased cancer risk. Increased tobacco use relative to the general population contributes to higher rates of lung and other cancers among many LGBTQIA+ people who have been studied. As recommended for the general population, clinicians should ask all LGBTQIA+ patients questions about tobacco use, encourage smoking cessation, and perform cancer screening for anyone with a history of tobacco use. Higher rates of sex work, unprotected sex, and HIV infection in trans people can also put individuals at greater risk for human papillomavirus (HPV)–mediated cervical and anal cancers. Trans people living with HIV should be screened for AIDS-defining cancers like Kaposi sarcoma and non-Hodgkin lymphoma.

Insufficient evidence exists regarding whether hormone use among trans people increases cancer risk. Cancer screenings should be offered to all patients based on organ inventory and behavioral risk factors, in accordance with current guidelines for the general population. A full medical, surgical, and sexual history is critical to determine which routine screenings are appropriate for an individual trans patient.

Cervical Cancer Screening

All people with a cervix should receive cervical cancer screening. Research into the accuracy and sensitivity of self-collected samples for cervical cancer screening is ongoing, as this option is more

acceptable to trans men and nonbinary people assigned female at birth (AFAB) than clinician-obtained samples. Further efforts to improve accessibility and tolerability of preventive cancer screenings for trans people are critical.

Prostate Cancer Screening

Trans people with a prostate should receive prostate exams if indicated, based on guidelines for cisgender men. Androgen suppression likely reduces prostate cancer risk for some trans women and nonbinary people assigned male at birth (AMAB) who undergo surgical removal of the testes, hormone therapy, or both.

Breast Cancer Screening

Breast cancer screening guidelines continue to evolve for cis women, leaving open the question of how to adapt these recommendations for trans people.

Current data suggest that trans women and nonbinary people AMAB taking feminizing hormones have the same or lower incidence of breast cancer as do cis women. Due to variable length of estrogen exposure compared to cis women, screening mammography is not recommended for trans women until the age of 50; after 5 to 10 years of feminizing hormone use, mammography should be performed every 2 years thereafter. Longer duration of feminizing hormone use, significant family risk factors, or genetic mutations like *BRCA* may be cause for earlier or more frequent screening, at the clinician's discretion.

Trans men without a history of mastectomy or chest reduction surgery should be screened according to current guidelines for cis women. Trans men who have had bilateral mastectomy should be counseled that insufficient data exist regarding risk of breast cancer in residual chest tissue. If indicated, clinicians may perform screening chest exams; when mammography is not feasible, MRI or ultrasound may be appropriate for further assessment.

Cardiovascular Disease, Diabetes, and Osteoporosis

Screening for cardiovascular disease (CVD), diabetes, and osteoporosis in trans people is also important due to structural, pharmacological, and behavioral risk factors for developing these conditions.

Cardiovascular Disease

Higher rates of tobacco use, obesity, diabetes, lipid disorders, and low physical activity contribute to elevated CVD among trans women. Feminizing hormones like synthetic estrogen are thrombogenic (i.e., encourage clot formation), but the few studies of hormone effects on blood pressure and lipids in trans people show only mild, almost clinically insignificant effects. Since transdermally delivered estrogen is associated with lower rates of venous thromboembolism (i.e., a blood clot forming in a vein) and does not alter the lipid profile, it is preferable for trans women with cardiovascular risk factors or ongoing CVD. Trans men taking testosterone do not appear to be at greater cardiovascular risk compared to cis women.

Diabetes

Type 2 diabetes (T2D) rates are higher among trans than cis people. Behaviors more prevalent among trans people, including increased tobacco and alcohol use, augment the risk of developing T2D. Another factor is hormone therapy: Trans women taking oral estrogens may experience elevated triglycerides and altered insulin resistance, and testosterone may increase hemoglobin and hematocrit in trans men. Obesity and hyperlipidemia (i.e., having a high level of fats, like cholesterol and triglycerides, in the blood) are also more likely in trans than cis men. For trans people living with HIV, certain antiretroviral medications can also increase T2D risk. Since T2D disproportionately affects racial and ethnic minority people, risk for trans people of color is compounded. Clinicians should adhere to national T2D screening recommendations for trans patients, irrespective of hormone therapy.

Osteoporosis

Bone density screening in trans people should follow recommendations for cis women: Initiate bone density screening at age 65, or after 50 in the presence of established osteoporosis risk factors. Being agonadal (i.e., not having sex glands, or testes/ovaries) increases risk of bone loss, so trans

people with a history of gonadectomy (i.e., surgical removal of the ovaries/testes) who are not receiving hormone replacement should follow screening guidelines for agonadal or postmenopausal cis women.

Mental Health, Sexual Health, Substance Use, and Violence

Trans people have increased risk of depression, anxiety, and suicidality relative to their cis LGBQ counterparts, whose risk is itself higher than in the general population. Routine screening for mental health conditions and a thorough history of previous treatments are thus essential, as is a trauma-informed approach when caring for trans patients.

Tobacco, alcohol, and recreational drug use among LGBTQIA+ individuals may be up to three times that of the general population. Substance use may be a coping strategy for depression or anxiety. Clinicians should obtain a detailed substance use history and use a harm reduction framework to engage trans patients in dialogue regarding substance use behaviors.

Sexual health risk assessment for trans people should focus on current anatomy and sexual behaviors of themselves and of their partner(s). Risk may change as anatomy and behaviors change and should therefore be continually reassessed. For people engaging in high-risk behaviors, screening for sexually transmitted infections can be done as frequently as every 3 months. Higher rates of HIV and injection of drugs, hormones, and soft tissue fillers (which some trans women pursue to alter their body contour) place some trans people at heightened risk of hepatitis C infection. Clinicians should screen all trans patients for hepatitis C risk factors and test all trans people who inject soft tissue fillers.

According to the 2015 U.S. Transgender Survey, approximately 50% of all trans people and greater than 50% of trans people of color experience sexual violence at some point in their lifetimes; greater than 50% reported some form of intimate partner violence (IPV). Clinicians should know how to ask trans patients questions about IPV and other types of violence in a trauma-informed manner and be prepared to provide referrals as needed.

Prince, Virginia

Virginia Prince (1912–2009) was among the first out trans activists in the United States. She was a public speaker, publisher, editor, and author who advocated for acceptance of heterosexual male crossdressers from 1960 until the early 2000s. She described herself as a “transgenderist,” which many people consider to be the origin of the word *transgender.*

Virginia Prince was born on November 23, 1912, in Los Angeles, California, the first-born child in a conventional upper-middle-class white family of four. Prince, a good student and a physically active individual, completed her schooling in 1939 with a doctorate in pharmacology. Prince developed a successful

manufacturing business, sold it for a considerable profit in 1968, and retired at age 55, after which time Prince began to live full-time as a woman until her death in 2009 at the age of 96.

Prince started being fascinated and sexually aroused by women's clothing at 12 years old. By the age of 16, Prince had become completely committed to crossdressing for erotic purposes and continued to secretly crossdress for decades. It was not until age 30, at a time when crossdressing was illegal and extremely stigmatized, that Prince first learned of and met another crossdresser, Louise Lawrence, and a small circle of crossdressers who met secretly in Long Beach, California. Lawrence later began to live full-time as a woman and served as a role model for Prince.

Prince first married in 1941. The marriage, which lasted for 10 years, produced one son. During this marriage, Prince secretly wore her wife's clothing and sometimes went out in public dressed as a woman. In 1953, divorced and engaged in a custody battle, Prince's crossdressing was exposed in court and written about in Los Angeles newspapers. Remarkably, the court decision did not appear to be negatively influenced by Prince's crossdressing.

In 1956, Prince married a woman who already knew that Prince crossdressed, and around the same time, Prince began to take sufficient feminizing hormones to grow breasts but not enough to inhibit erections. Prince's second wife went out in public with Prince dressed as a woman, participated in Prince's sexual fantasies, and later assisted when Prince made presentations in college classes. The marriage ended in 1966.

In 1960, Prince began publishing the magazine *Transvestia,* whose objectives stated on page 1 in Vol. 1, No. 1 were "To provide EXPRESSION for those interested in the subjects of exotic and unusual dress and fashion. To provide INFORMATION to those who, through ignorance, condemn that which they do not understand. To provide EDUCATION for those who see evil where none exists." *Transvestia* became one of the most important publications in the trans community of its time. The magazine was usually about 90 pages, with many black-and-white photographs and a personal ads section at the back. At its peak, it had about 1,000 subscribers. Prince remained editor for the first 100 issues, through which she exerted a profound influence on the development of transgender thought across two decades. Prince's publishing house, Chevalier Publications, published *Transvestia* for 111 issues until 1986, as well as other small books of interest to the crossdressing community.

Also in 1960, Prince was charged with sending obscene letters through the U.S. postal system as a result of sexually explicit correspondence with another crossdresser. Convicted in 1961, Prince managed to avoid jail time, but crossdressing in public, being illegal, would have constituted a probation violation. Prince's lawyer negotiated permission for Prince to publicly crossdress for educational purposes and, with that, Prince's career of more than four decades as a public speaker and fearless outspoken advocate for crossdressers was launched.

In 1961, Prince started what may have been the first support and advocacy organization for trans people in the United States. Initially called the Hose and Heels Club, soon after, it became known as the Alpha Chapter of the Foundation for Full Personality Expression (FPE), and later it evolved into the Society for the Second Self (Tri-Ess), which then expanded into a national and international organization whose members, in turn, went on to found other significant advocacy and support organizations.

Admired by many as a strong and courageous leader, Virginia Prince held many controversial opinions and expressed them forcefully. In Prince's view, only heterosexual male crossdressers should be admitted to membership in FPE. No gay men or lesbian women were allowed because Prince felt that they would never gain acceptance and that their presence would taint the respectability of the organization. Neither could transsexual people join FPE lest wives of crossdressers, fearing that transsexualism was a possible outcome of crossdressing, would oppose their husbands' membership in FPE.

On the other hand, some of Prince's views were ahead of their time. For example, Prince, who insisted that sex and gender were entirely independent phenomena and advocated that gender was more important than sex, gave us the expression "sex is between the legs, gender is between the ears." Prince also gave us the word *transgender* by calling herself a *transgenderist* (full-time, no genital surgery) to distinguish herself from both transsexuals (full-time, genital surgery) and transvestites (part-time, no genital surgery)—the only two *trans* terms available at the time.

Decades before it became widely accepted, even among trans people, Prince also demanded that she be fully recognized as a woman despite retaining and enjoying the use of her penis. However, she also regarded genital surgery as an unnecessary and mistaken choice for others. While her very public claim to being a "woman though male" created welcome gender space for some people, her stance on genital surgery also enraged many transsexual women who felt denigrated by Prince's public pronouncements on the subject. Virginia Prince was a powerful and effective advocate for heterosexual male crossdressers at a time when few others would take the risk.

Puberty Blockers

Puberty suppression is a therapeutic strategy used to halt temporarily the development of secondary sexual characteristics in youth with persistent or worsening gender dysphoria. The purpose of *puberty blockers*, also known as *pubertal blockers*, is twofold: first, to decrease the distress caused by these physical changes and provide a window of time for the youth to explore their gender identity and the ultimate optimal approach to their gender dysphoria (i.e., the initiation of gender-affirming hormones and/or gender-affirming surgical procedures) and, second, to allow families, when needed, to inform and prepare themselves in order to better support youth as they begin to live in their affirmed gender and/or begin gender-affirming therapies. Although not specifically approved for this purpose, they are a valuable therapeutic tool in the management of transgender, gender-nonconforming, or nonbinary youth because they are considered to be fully reversible and safe.

The most commonly used medications to suppress or stop puberty are gonadotropin-releasing hormone (GnRH) analogs, which have been used for the treatment of precocious (i.e., early) puberty in children and, in adults, as part of the treatment for some hormone-dependent cancers, conditions such as endometriosis and uterine fibroids, and as part of fertility treatments. GnRH is released by the hypothalamus in pulses, which in turn promotes the secretion of luteinizing and follicle-stimulating hormones (LH and FSH) by the pituitary. GnRH analogs, by providing constant levels instead of pulses, effectively suppress the hypothalamic-pituitary-gonadal axis, with a resulting absence of endogenous sex steroid production. In pubertal youth, this prevents the development of secondary sexual characteristics, such as breast development, facial hair growth, and voice changes, among others, and the maturation of the reproductive organs, which is needed for production of sperm by the testicles and eggs by the ovaries. Other medications that have been used for this purpose include medroxyprogesterone acetate, antiandrogens, and antiestrogens, but these have given way to GnRH analogs due to their greater availability and accessibility, efficacy, the vast clinical experience in the management of precocious puberty, and the ever-growing clinical experience for the treatment of gender dysphoria in youth.

Puberty blockers were first used in the treatment of children and adolescents with gender dysphoria in the Netherlands, where the original treatment consisted of psychosocial support for

children; the initiation of puberty blockers at the onset of puberty (i.e., sexual maturity rating [SMR] 2 or Tanner Stage 2); the initiation of gender-affirming hormones at age 16, which coincides with the legal age of consent; and surgical interventions no earlier than 18 years. This model of care continues to be endorsed by clinical guidelines from most countries and centers that support the gender-affirming model of care for trans youth, but it is now common for the latter two of these interventions to be initiated on the basis of individual patient/family factors rather than on strict age criteria. Here the goal is to allow trans youth to have puberty and adolescence experiences similar to those of their cisgender peers while minimizing the potential risk of harm that could occur from the early or inappropriate use of therapies that are not fully reversible (i.e., gender-affirming hormones, gender-affirming surgeries).

As stated earlier, puberty blockers should be started no earlier than the onset of puberty; to begin sooner provides no clinical benefit. For patients who present for care prior to this, the treatment goals should include psychosocial support of the child and family, which may include a social transition during which the child begins to present as their affirmed gender. Adequate counseling and follow-up should be provided in order to identify the first signs of puberty, which consist of the appearance of breast buds, or thelarche, in youth assigned female at birth (AFAB) and testicular growth, or gonadarche, in youth assigned male at birth (AMAB). There is evidence that youth are able to adequately identify their sexual maturity rating, or Tanner stage, when taught to do so, obviating the need for frequent genital and/or chest exams, which may be distressing to some. Once puberty has begun, the use of puberty blockers should be started without delay to prevent further irreversible changes. Youth that present for treatment after the onset but before the completion of puberty (i.e., SMR 3 or 4) may still benefit from prompt endogenous puberty suppression, as the irreversible development of secondary sexual characteristics is a continuum that extends past SMR 5.

With puberty onset appearing as early as 8 or 9 years for youth AFAB and 9 or 10 for youth AMAB, puberty blockers are a temporary measure whose ultimate goal is to buy time to allow for adequate cognitive development in order for the youth to fully understand the consequences of receiving partially or mostly irreversible treatments. With this in mind, it may seem reasonable to delay these treatments as much as possible; however, preventing trans youth from entering puberty in synchrony with their peers can have developmental and psychological consequences. As with all interventions, it is of the utmost importance to weigh the risks and benefits of starting, continuing, stopping, or delaying any of the available treatments that exist to alleviate gender dysphoria, and particularly with youth, this risk/benefit calculation should be revisited as frequently as the youth matures developmentally.

Side effects of puberty suppression with GnRH analogs are mainly related to bone health and fertility. Decreased bone mineral density is a potential risk of puberty blockers as bone accretion is dependent on sex hormones. There is limited evidence on the long-term effects of puberty suppression on bone health, but some studies suggest that bone accretion resumes and, to some degree, compensates with the addition of gender-affirming hormones. Some guidelines recommend bone mineral density monitoring while the youth receives GnRH analogs, and others recommend measuring vitamin D levels and/or vitamin D supplementation. The potential risk to bone health with prolonged use of GnRH analogs should be taken into account when deciding the right time to begin gender-affirming hormone therapy. For nonbinary patients, puberty suppression may provide significant relief, but discussions should include future plans to either begin treatment with gender-affirming hormone therapy or allow the patient to progress through puberty, since puberty suppression is only a temporary measure.

The fertility potential of youth who receive puberty blockers early in puberty and then begin gender-affirming hormones is affected because the lack of endogenous sex hormones prevents the development of viable sperm or eggs. Although still experimental, some strategies to preserve fertility prior to the use of gonadotoxic therapy (e.g., chemotherapy) are promising as a future option for transgender and gender-diverse youth. Fertility preservation, however, is usually not readily available as it can be expensive and not commonly covered by insurers. This highlights the importance

of providing comprehensive and age-appropriate fertility counseling at the very least before beginning puberty suppression and again prior to starting gender-affirming hormones.

Puberty

Puberty is the process of physical maturation, during which there is an acceleration in growth in stature, secondary sexual characteristics appear and develop, and the ability to reproduce is achieved.

For transgender (trans) youth, the onset of puberty may mark the beginning of permanent and visible changes that may result in, or worsen, gender dysphoria. In this context, it is important to understand the concept of puberty, its timing, and its stages in order to tailor clinical interventions for youth who require them.

Puberty onset varies between sexes, appearing on average earlier in youth assigned female at birth (AFAB) around 10 to 11 years of age, compared with those assigned male at birth (AMAB) around 11 to 12 years of age. Aside from biological sex, timing of puberty varies across races, with an earlier onset in Black AFAB youth. It has also been noted that puberty is starting at increasingly younger ages on average, presumably as a result of positive factors such as improved nutrition, as well as a result of obesity (specifically in AFAB youth) and various potentially noxious environmental exposures (e.g., certain pesticides). Although the factors that determine the onset of puberty are not fully understood, it has been determined that puberty starts when the hypothalamus begins releasing gonadotropin-releasing hormone (GnRH). This production of GnRH begins to occur in pulses, and it is this pulsatile release that stimulates secretion of the gonadotropins, luteinizing hormone (LH) and follicle-stimulating hormone (FSH), from the anterior pituitary. Growth of ovaries or testes occurs as a result of the rising levels of LH and FSH, and these organs begin to produce estradiol (estrogen) and testosterone, respectively.

Pubertal development can be assessed by quantifying changes in breast development and pubic hair appearance and pattern for youth AFAB and genital changes (testicular and penile) and pubic hair for youth AMAB. The sexual maturity rating (SMR), also known as Tanner staging, is used to assess the progress through puberty and graded as 1, for prepubertal characteristics, through 5, for fully developed secondary sexual characteristics, with progressive and defined stages in between.

Differences in Puberty Between Individuals AFAB and AMAB

In AFAB youth, pubertal changes are mainly driven by hormonal rises in estradiol. The onset of breast/areolar development (*thelarche*) is usually the first sign of puberty, with the appearance of what is known as a breast bud (SMR 2) (~10.5 years). Further development and appearance of the breast and the nipple-areolar complex allow determination of SMR 3 to 5, with the latter describing a fully developed breast.

Thelarche is usually followed by *pubarche*, the appearance of pubic hair. Initially a few, thin, straight hairs appear alongside the labia (SMR 2), progressing to coarser hair filling the pubic triangle (SMR 4) and spreading to the upper thighs and lower abdomen (SMR 5).

Rising levels of estradiol produce the following genital changes: thickening of the perineal skin, thickening of the vaginal mucosa and an increase in its glycogen content, increase in size of the

uterus with consequent increase in the uterine body–to–cervix ratio from 1:1 before puberty to 2–3:1 after pubertal development is complete, and an increase in ovarian size and the development of larger ovarian follicles, which contain the egg surrounded by cells that at different times in the menstrual cycle produce sex hormones, including estrogen, testosterone, and progesterone.

The onset of menstruation, or *menarche,* is another landmark of pubertal development for AFAB individuals. It typically occurs 2 years after thelarche, with a wide normal range between 8 and 16 years. Initially, menstrual periods may be irregular because further maturation is required before ovulation. As the reproductive hormonal system matures, cycles become ovulatory and, as an effect of this, usually more regular and predictable. Both thelarche and menarche may be determining factors in worsening gender dysphoria for trans youth and may create extreme distress that, on occasions, may lead to worsening behavioral health and even suicidality.

Other changes experienced by females during puberty include widening of the hips, as well as increased fat tissue overall and preferential deposition on breasts, hips, buttocks, thighs, upper arms, and pubis, thus creating a typical female fat distribution. All of these changes may worsen gender dysphoria in trans youth.

In AMAB youth, pubertal changes are driven by testosterone and are collectively known as *virilization*. The earliest change in sexual maturation is an increase in testicular volume (≥4 mL) and length (≥2.5 cm), also known as *gonadarche,* and it is one of the parameters used in the sexual maturity rating, or Tanner staging. Testicular growth progresses from SMR 1, when testicular volume is less than 1.5 mL, to SMR 5, with a volume greater than 20 mL over approximately 6 years following the onset of puberty.

Testicular changes usually precede the increase in penile length and, subsequently, breadth by about a year. Penile growth is driven, in part, by enlargement of the glans penis and the corpora cavernosa, structures that, when engorged with blood, result in erections. Penile growth is accompanied by widening of the foreskin opening, allowing for easier retraction down the shaft of the penis. As puberty progresses, spontaneous erections become more frequent and may be a source of occasional embarrassment in many cases, as well as a source of worsening gender dysphoria for trans youth.

Reproductive maturation is heralded by the first ejaculation, which, on average, occurs at age 13. It is not uncommon for ejaculations to occur during sleep, a phenomenon known as a nocturnal emission or "wet dream." In the absence of comprehensive sexual and reproductive education, these nocturnal emissions may cause distress and even be confused with bedwetting or enuresis by the uninformed youth.

Pubarche in AMAB youth is characterized by the appearance of a few hairs on the dorsal base of the penis, shortly after the onset of genital growth. In SMR 3, usually 6 to 12 months after pubarche, there is further increase in the number of hairs, which, by SMR 4, densely fill the pubic triangle. In SMR 5, pubic hair spreads to the thighs and may spread to the lower abdomen, often attaining a diamond-shaped escutcheon.

Other changes that AMAB youth experience throughout puberty include increase in bone mineral density and skeletal muscle, with characteristic male bone growth, including wider shoulders and jaw. AMAB individuals tend to have higher lean body mass and lower body fat than those AFAB. Muscle growth tends to appear during later stages in puberty and may continue well beyond its completion. Peak skeletal muscle growth appears approximately 1 year after the growth spurt. Other changes driven by testosterone include the appearance of male-pattern body hair, which comprises axillary hair, perianal hair, facial hair (upper lip, sideburn, beard area), and periareolar hair. Arm, leg, chest, abdominal, and back hair appear and increase more gradually.

Another important aspect of virilization is the growth of the larynx, which causes deeper voice pitch as a result of longer and thicker vocal folds. The accompanying growth of the thyroid cartilage is what composes the laryngeal prominence, or Adam's apple. Most of these changes occur during SMR 3 to 4 with attainment of adult pitch, on average, around age 15 years.

While these changes may vary from individual to individual, they are fairly consistent both in characteristics and in timing. The changes attributed to increasing levels of estradiol and testosterone are predictable and, often, so is the distress

that may accompany their appearance for trans youth. Understanding and acquiring the skills necessary to assess the changes that mark the onset of puberty are of high importance, as they mark the earliest opportunity for medical interventions. Current treatment of gender dysphoria favors the arrest of pubertal development of the sex assigned at birth with the use of gonadotropin-releasing hormone analogs (puberty blockers) with subsequent pubertal induction with the hormone that more closely correlates with the youth's identity.

Public Opinion of/Climate for

This entry reviews public attitudes about trans people and trans rights. Very little was known about such public knowledge and attitudes prior to the mid-2000s. The earliest study in the 1960s of a representative sample of medical professionals revealed sharp differences in the legitimacy of medical interventions for transsexual people. Since then, social psychologists have developed scales of attitudes toward trans people, although usually based on student or other convenience samples. Since 2010, representative studies in the United States and across the globe have started to build a knowledge base. This literature suggests that the correlates of attitudes toward lesbians and gay men and LGB rights tend to associate similarly with trans people and trans rights. American adults, however, tend to be more antagonistic to trans people, and the public remains divided on certain topics such as gender identity public accommodations protections and gender-inclusive sex-segregated sport participation. Despite a growing knowledge base, more research is needed to understand the correlates of public opinion and interventions that may foster a reduction in the prejudices people may hold.

This entry situates the current state of knowledge on transphobia and attitudes toward trans people and trans rights. The first section provides a theoretical framework for gender stigma and prejudice and explains the distinctions between transphobia, attitudes toward trans people, and attitudes toward the rights of trans people. Next, a brief discussion of scales meant to operationalize attitudes is presented. Finally, a review of the existing literature on public opinion is provided with attention to experimental interventions shown to reduce prejudices.

Trans people may be broadly defined as people whose gender identity or expression is different from that of their assigned sex at birth. Studies have documented experiences of trans discrimination, how lack of public employment protection policies may facilitate in such discriminatory experiences, how certain policies relying on sex classifications may result in denial of public goods and services for trans people, and the consequences of such experiences—increased thoughts of suicide, self-harm, and other factors related to internalized stigma. Studies have shown that the health and well-being of lesbian, gay, and bisexual people are linked to public policies affecting them and the social climate in which they live. Indirect structural factors relating to gay rights and public attitudes toward lesbians and gay men relate to the number of suicide attempts by trans adults. Similar explanations likely exist for structural factors directly relating to trans stigma. Social climate, however, requires measuring the attitudes of the mass public about minorities and their attitudes toward policies relating to those minorities. There have been few nationally representative surveys about attitudes toward trans people, especially in comparison to other groups.

Without such studies, the factors underlying the attitudes of the public remain less well known. It remains less clear, for example, the extent to which

people's attitudes are dependent on developing a fuller understanding of trans people and knowing trans people. It remains unknown whether experiences of discrimination and negative outcomes in health and well-being among trans individuals are directly related to these attitudes. The linkage between people's attitudes and public policy is also underaddressed, which may be another mechanism through which attitudes indirectly affect the physical and psychological health of trans people. Without a clearer and generalizable understanding of transphobia, attitudes toward trans people and rights, therefore, are only impressions, intuitions, and potential misinterpretations about how trans people's experiences are shaped by these attitudes.

Stigma and Prejudice: Conceptualizing Attitudes

A framework for understanding the way attitudes are formed about trans people is to acknowledge both the hierarchical or structural social components framing human interactions and the personal or psychological components of internalizing these structures. The former may be more clearly defined as stigma, while the latter is more closely linked to prejudice. Stigma refers to the collective, societal-level negative sentiment toward people who have a certain trait or group membership, resulting in beliefs that those individuals have a lower social status. Several social reinforcements of strict traditional gender roles may result in stigma toward those who transgress those gender roles. The social reinforcement of gender norms occurs through policies (e.g., sex indicated on driver's licenses), social custom (e.g., dress standards), and public accommodations (e.g., restrooms). Policies that classify people by gender or sex may ultimately be used to deny trans people public services. Trans people may be stigmatized because they transgress the value society has placed on gender and gender norms.

The structural and social aspects of stigma may be internalized by those who are not stigmatized. When those who are not stigmatized internalize stigma, it is expressed as negative attitudes toward those who are stigmatized, which is called prejudice. Sexual prejudice is viewed as the internalization of societal sexual stigma that may result in negative attitudes toward lesbians, gay men, and bisexuals. Trans people may be stigmatized because they do not conform to gender norms or stereotypes expected of their assigned sex at birth, and people who are cisgender may internalize this stigma and form negative attitudes toward those who are trans. The relationship between sexual prejudice and prejudice toward trans people may be closely related, although they should be seen as conceptually distinct. For example, some LGB people experience prejudice, discrimination, or violence as a product of their gender-nonconforming behavior as opposed to other aspects of being a sexual minority. Trans people may not experience prejudice and stigma uniformly, because some trans people are perceived by others to be gender nonconforming while others are not. Trans people who are perceived to be gender nonconforming are more likely to report experiences of violence, harassment, and discrimination.

The socialization of gender and gender norms begins at birth, and gender is one of the most fundamental categories that divides the social world. Given the primacy of gender in everyday interactions, trans people may be uniquely targeted by prejudice for challenging norms that seem so fundamental. The extant literature has not adequately or consistently used terms to define stigma or prejudice relating to people who are trans. Following the terminology of sexual stigma, it may be appropriate to define gender stigma as the stigma attached to behaviors, identities, relationships, or communities involving gender nonconformity. Similarly, gender prejudice is internalized gender stigma resulting in the negative evaluation of people who are trans or gender nonconforming. Since these terms have seldom been used in the existing literature, the following section will discuss how gender prejudice has been operationalized and labeled.

Three constructs of gender prejudice encompass the numerous ways studies have approached measuring and understanding the attitudes people have toward trans people. Since 2005, there has been an increasing effort among social scientists to develop a standardized scale for measuring these constructs, although only a few have been used in multiple studies.

Transphobia

The elements underpinning transphobia may be rooted in emotional and cognitive psychological

processes that reinforce heteronormativity and gender conformity. Scholars have used different terms to define the construct. One of the most widely used scales is the Genderism and Transphobia Scale (GTS), which conceptualizes gender prejudice as comprising three constructs: transphobia, genderism, and gender-bashing. *Transphobia* is a feeling of disgust toward people who fail to conform to gender role expectations. *Genderism* relates to people's negative evaluation of gender nonconformity, and *gender-bashing* refers to reported behaviors such as assault or harassment of people who do not conform to gender norms. Transphobia is an emotional process, genderism is cognitive, and gender-bashing is behavioral. Others have used the term *transprejudice* for the internalization of stigma toward trans people. While there are conceptual differences between transphobia and transprejudice, their measurement is quite similar.

Attitudes Toward Trans People

The preceding discussion relating to transphobia stresses that attitudes are about the acceptance of gender-nonconforming behavior among people. Many questions used to measure transphobia emphasize feminine men or masculine women. This does not necessarily encompass people who identify as trans. Studies have asked specifically about the acceptability, beliefs, and attitudes toward transsexuals, crossdressers, and trans people. These approaches focus less on the acceptability of specific behaviors and emphasize individuals who identify with a social group that is stigmatized. This is the primary difference between attitudes toward trans people versus transphobia. The earliest studies of attitudes were squarely focused on individuals who identify as transsexuals. More broad and inclusive language has developed since the earliest studies, and more recent research investigates attitudes toward people who identify as trans.

Attitudes Toward the Rights of Trans People

Like attitudes toward trans people, previous studies have asked whether they support certain social policies that would affect the lives of people who are trans. These policies vary from study to study and include questions such as whether state-funded health insurance should cover costs relating to transition, whether gender identity should be included in nondiscrimination policies, and whether gender markers on birth certificates and other government documents can be updated. Some studies have approached attitudes on social policy as synonymous with general attitudes toward the group, while others investigate the relationship between the two, or with transphobia. Attitudes on social policy affecting a minority group may not necessarily equate to an individual's attitude toward that group. For example, opinions regarding affirmative action for Black people bear little relationship to explicit warm or cold feelings toward Black people. Similarly, attitudes toward the rights of lesbians and gay men are only moderately related to their levels of sexual prejudice. Although gender prejudice may bear a relationship to attitudes on trans rights, other outside factors likely influence policy opinions in addition to transphobia and attitudes toward the group (e.g., partisanship and religious affiliation).

The studies that measure gender prejudice use different research strategies and conduct interviews in a variety of ways. Most studies on this topic use college or university students. There exist more than 80 scales measuring transphobia, attitudes toward trans people, and attitudes toward trans rights. However, the proliferation of such scales does not mean they are widely applied, especially in national studies of public opinion.

Studies of Public Opinion

The earliest probability-based study of attitudes toward transgender people was conducted in the 1960s among medical professionals. The primary focus of early studies was on attitudes toward gender confirmation surgery among general medical practitioners, urologists, gynecologists, and psychiatrists. It asked them about their perception of the mental health of people seeking gender confirmation surgery. While there were minimal differences among these three groups, psychiatrists were most likely to be supportive of gender reassignment surgery while the other medical groups were less likely. Additionally, the other groups were more supportive if there was a recommendation from a psychiatrist. This study was replicated in 1986 and showed that medical professionals' knowledge levels had increased. Also, both support for gender confirmation surgery and positive

impressions about people seeking transition-related care had more than doubled. Other surveys ask policy-related questions regarding gender confirmation surgery, the most common of which is whether the costs relating to transition should be included in state-funded health care. The earliest survey on this topic was in Sweden in 1998, and the authors found clear majorities of support for rights to transition but also found a majority of Swedes felt the trans person should bear the costs associated with transition.

Observational Studies of Public Opinion

Since 2015, there has been a marked increase in the number of studies on U.S. public attitudes about trans people and trans rights. Surveys of American adults often show vast majorities in support for numerous rights. This includes broad nondiscrimination protections in employment, public housing, and accommodations. A majority of the American public supports open service in the armed forces and believes gender markers should be changeable on government-issued identification documents. American adults also tend to be opposed to the use of conversion therapy on trans youth but remain evenly divided on certain areas of public policy such as specific gender identity provisions in public accommodations protections involving bathrooms, changing rooms, and locker rooms and participation in sex-segregated sports. They also are less supportive of policies regarding public insurance coverage of gender-inclusive medical care. Yet, there is further evidence to indicate that public support has increased over time.

Studies suggest that the American public organizes their opinions on rights along two dimensions. On one dimension, there are policies pertaining to general equality like broad nondiscrimination protections and other aspects of equal treatment. On the other dimension, there are policies pertaining to body politics where the presence of trans people is under question (e.g., public bathrooms or sports participation) or in medical-related policies (e.g., public coverage of transition-related care). While these two dimensions are highly related with one another, public support is on average higher on the first dimension and lower on the second. These two dimensions also reflect rights discourses, with advocates in favor embracing equality while those opposed emphasize policies such as public accommodations.

A plurality of American adults believes that there exist only two genders, and they also perceive trans people to face a lot of stigma in their day-to-day lives. Most American adults think they have a good amount of knowledge about trans people, even though only about one in four is likely to personally know a trans person as a close friend or family member. With the increased visibility in mass media, there is potential for numerous individuals to increase their familiarity and knowledge.

Common Correlates of Public Attitudes

Gender. Quite possibly the most common finding in the literature is the existence and persistence of a gender gap. Men have more negative attitudes and women have more positive attitudes. While the indicator of male or female is predictive of attitudes, more complex measures of gender also find that the more gender conforming men and women are in their behaviors, the more negative their attitudes. Thus, the gender gap may be connected to a gender nonconformity gap, with those in the public who engage in less stereotypically gendered behaviors being more supportive.

Sexual Orientation and Gender Identity. People who identify as LGBTQ often hold the most positive attitudes, on average, whereas cis heterosexual women have more positive attitudes than cis heterosexual men.

Educational Attainment. Those who have higher levels of educational attainment tend to report more positive attitudes. Additionally, those with greater educational attainment perceive that they have adequate knowledge and understanding. The college experience may offer opportunities to think critically about gender and increase the chances for exposure to diversity, which may also be a source of increased understanding.

Partisanship and Ideology. In the United States, Democrats, independents, political liberals, and moderates tend to have more favorable attitudes. Republicans and conservatives tend to hold attitudes less favorable. The partisan gap has widened

over time, as elected officials in both parties have staked opposing viewpoints.

Gender Role Beliefs. People's adherence to traditional gender roles is a source of negative attitudes. Studies find that those who are more traditional in their beliefs about gender roles hold more negative attitudes.

Values. Individuals who are more egalitarian hold values that society operates best when people are offered more equal chances to succeed in life. Egalitarian values positively predict supportive attitudes. Individuals who are more authoritarian hold values that individuals should obey authority. Authoritarian values negatively predict supportive attitudes.

Emotions. People's attitudes about public policy are emotionally laden. A common emotion predictive of negative attitudes is disgust. Those who are more easily disgusted are less favorable.

Interpersonal Contact With Trans People. Knowing and interacting with someone who is from a minority group is one of the primary ways an individual may change their attitudes toward the minority group and reduce their prejudice. However, studies are mixed about interpersonal contact with trans people, with some finding positive associations but others finding no association. Studies show that trans television celebrities and characters may also reduce negative attitudes toward trans people, but the findings are mixed. Studies suggest that the way trans people are represented conditions how viewers respond, with certain representations increasing negative attitudes while others do not reduce prejudice.

Origins of Being Trans. Several studies indicate that people who believed that being trans has biological origins were more likely to have more positive attitudes.

Attitudes Toward Sexual Minorities. A consistent finding is that gender prejudice is strongly predicted by people's sexual prejudice.

Interpersonal Contact With Sexual Minorities. Studies have also shown that knowing someone who is lesbian, gay, or bisexual relates to more positive attitudes. This finding is called a secondary transfer effect of interpersonal contact. Just as knowing someone from a minority reduces prejudice toward that group, prejudice reduction may also expand to other minority groups.

Geographic Location. Attitudes of American adults also vary by geographic location, where attitudes of those in the South are more negative than those who reside on the West Coast and in northeastern parts of the United States (see Figure 1). Furthermore, attitudes are more negative in rural locations of the United States than those in urban or suburban locations.

Outside the United States, there have been a few cross-national surveys. Countries with greater levels of religiosity, those that were former members of the Soviet Union, and countries with lower levels of cosmopolitanism are more negative. However, global understandings of trans people are quite variable, with some areas of the global South having a greater understanding and cultural tradition (e.g., *hijra* or Kinnar in India).

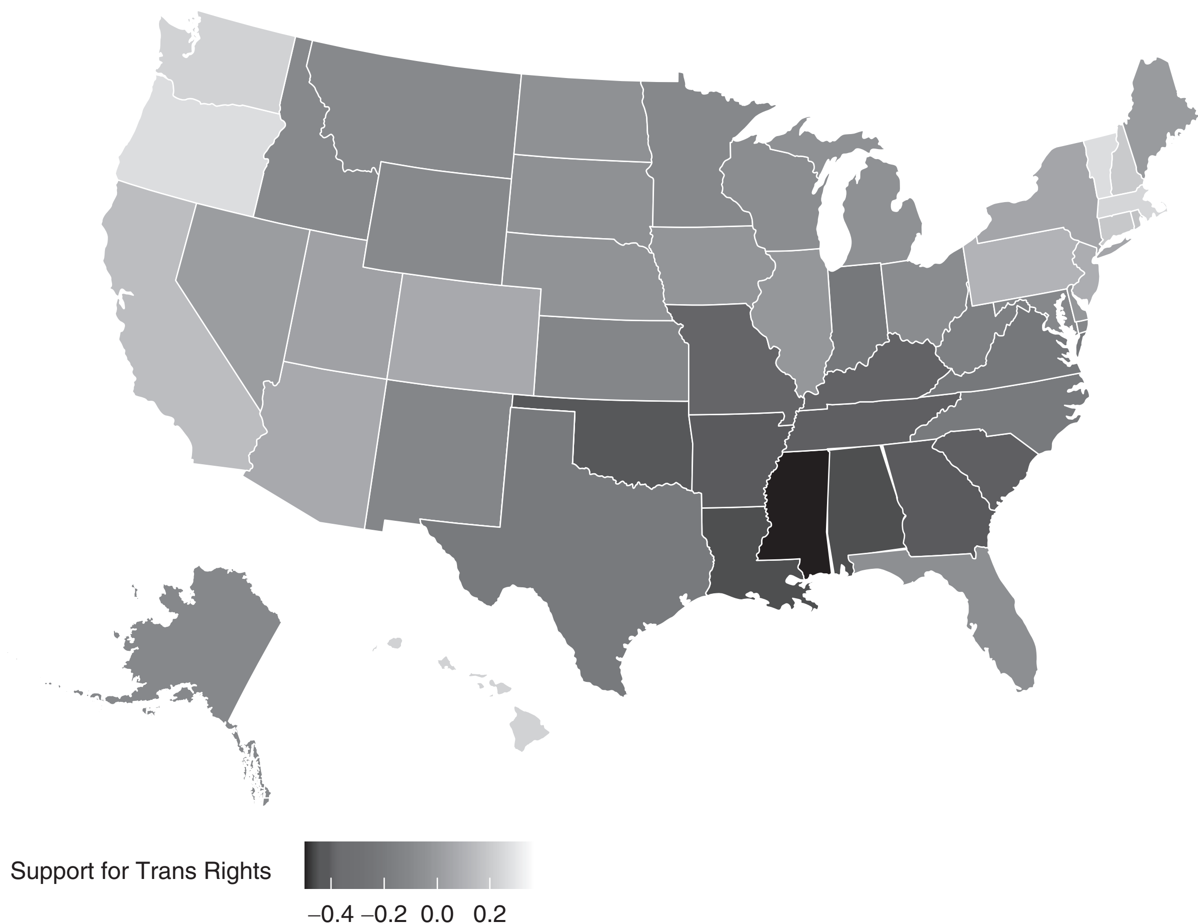
Experimental Studies of Public Opinion

In addition to studies of adults in the United States, experimental interventions have identified ways to reduce negative attitudes and potentially increase support for rights. One potential way is to engage in 15- to 20-minute discussions with people about trans people and trans rights. In the process of these discussions, people are encouraged to try to imagine what life would be like as a trans person and feeling stigmatized. This exercise, known as perspective taking, can reduce prejudice and sustain the reduction for months after the discussion. Studies further show that engaging in a conversation without critical judgment of an individual enables these conversations to be effective.

Other experiments have found that merely introducing the topic to others can be a source of prejudice reduction. If people are provided a definition of trans and images of presumably trans people, people express less prejudice. Furthermore, these exposure effects may also increase support for trans rights by reducing prejudice.

Another series of experiments has found that reminding people to be a "good person" may also

Figure 1 Public Opinion on Trans Rights Across the United States



Source: Author's own analysis of public opinion polls, 2015–2017.

enable people to be more persuaded by arguments to be more favorable. Individuals tend to process new information either quickly or slowly. This intervention is designed to encourage people not to jump to conclusions but to take in a broader set of considerations when forming their opinions.

Future Research Needs

While some comprehensive studies of public attitudes on this topic exist, they are limited in the scope of other factors that may be associated with attitudes. Such limitations include personally knowing parents of trans children, how people come to have trans people as close friends, and other psychological and emotional factors that structure public opinion. As new questions arise, it will be important to measure public attitudes, since public policy tends to correspond with majority support. With more than 80 scales to measure gender prejudice, national studies could field some of these established measures to comprehensively examine attitudes of the American public. Further data collection is needed in cross-national surveys to understand attitudes more comprehensively in a global context.

Although experimental interventions exist, few studies have evaluated how long such interventions reduce prejudice; among these, however, are some that indicate these may not be long-lasting. Outside of the perspective-taking studies, others have yet to evaluate long-term effects. Experimental interventions can further help in understanding the effect of trans representations in mass media. Finally, the promise of perspective taking begs the

question of whether such efforts can be scaled up in ways that may require fewer resources than in-person, 20-minute conversations.

Trans rights have emerged in the public consciousness, and social surveys and public opinion polls have gauged public attitudes. As a result, much is known about the factors that shape public opinion on these topics, yet at the same time ample research opportunities exist to further our understanding of gender prejudice and prejudice reduction.

Qualitative Research

Qualitative research (or inquiry) refers to a set of methods that are used to ascertain the meanings and experiences of issues related to human beings and societies, rather than natural objects in the world. These methods are well suited for the study of subjective, individual, and complex social phenomena because they are designed to study the content of holistic experiences as well as highly contextualized processes of developing understanding. Qualitative research methods have long been considered LGBTQIA+ methods because they offer an approach to science that centralizes the subjectivities of individuals from minority or marginalized groups (rather than the average experiences). This entry on qualitative research methods will describe what is meant by this term, its aims, and how these methods can improve our understandings of trans experiences, with examples of qualitative research related to Trans Studies.

Qualitative Methodology

The term *qualitative methods* has come to signify the analysis of language-based or arts-based data in contrast to numerical data, which are seen as the domain of quantitative research. Instead of generating statistical findings to predict and control events, qualitative methods facilitate the elucidation of the what, where, when, why, and how of a phenomenon. The term *human science* is sometimes preferred to refer to qualitative inquiry more generally. This term references a European Continental philosophical and scientific tradition arguing that humans should be studied using different methods than the natural sciences because of their unique capacity for reflexivity and consciousness.

Quantitative methodologies tend to be based within philosophical foundations that emanated from the natural sciences across many social sciences (e.g., psychology, sociology). The main goal for those methods is to produce findings that describe the variability of ratings of a phenomenon within the population of interest to the investigators. The transformation of data from holistic experience to numeric ratings is in line with the objectivist processes of reductionist materialism because it results in data that can be statistically analyzed and that examine a phenomenon (or part of a phenomenon) without requiring description of the nuances of its external situation or internal experiences. Ideally, participants are selected through random sampling and random assignment to support generalization to the population. Many quantitative analyses use statistical tests, which also assume that sample characteristics adhere to a normal distribution of data (i.e., a bell curve). Through this process, natural scientific methods aim to produce generalizable laws that are meant to be enduring.

In contrast, qualitative methods do not engage in the reduction of experiences and social practices by quantifying variables but, instead, analyze

variability within a phenomenon by studying richly contextualized data. For example, a quantitative study of transphobia is likely to engage a measure of transphobic experiences, with a total score that is averaged across the items and compared with other similarly averaged variables. A qualitative study might instead interview participants about their experiences in detail; analyze vivid idiosyncratic descriptions of the interpersonal contexts, social repercussions, and psychological experiences of these events; and identify patterns as they are intertwined. Findings are not meant to be enduring; they are specific to the ecological and historical context under study and expected to change as culture and meanings shift. Qualitative research is scientific in employing the systematic use of methods to arrive at findings that are insightful, are of high quality, and have methodological integrity.

In addition to reconsidering the methodology used to investigate a phenomenon, qualitative researchers have drawn attention to the need to consider epistemological assumptions—that is, theories and beliefs about how people gain credible knowledge. Because of their emphasis on reflexivity, human science approaches to research tend to be characterized by an intersubjective understanding of the research process in which both participants and researchers are recognized as co-constructing the data and findings. This contrasts with the approach characteristic of natural science, in which there is an essential, dualistic divide created between the researchers and their subjects, reflective of beliefs in researchers' disinterested objectivity.

In line with this intersubjective approach, human science researchers tend to be transparent about their assumptions and research procedures. For instance, qualitative researchers may describe in their reports their initial beliefs or allegiances or demonstrate how methods (e.g., queer theory) maximized the researchers' attunement to the experiences under study. Reflexive self-disclosure contributes to the rigor of an analysis by making evident the perspectives of investigators to the reader as well as the ways these were managed or used within the analysis. These approaches also encourage researchers to consider the influence of investigators' expectations upon participants' responses and the routine effects of participants' subjectivity, such as their ability to withhold or misrepresent experiences. For instance, in a qualitative study published in 2018 by Autumn Bermea and colleagues, called "Queerness and Dating Violence Among Adolescent Mothers in Foster Care," the research team wanted to compare the experiences of queer adolescent mothers in foster care who experienced teen dating violence with the experiences of program staff at the foster care facility serving them. The research team drew from queer theoretical perspectives to help them contextualize the mothers' sexual performativity and interpret how it was understood by both parties. Starting before the analysis and throughout the process, the research team used memo-ing to document their assumptions about adolescent mothers, the foster care system, and intimate partner dating violence. Additionally, the team met multiple times to discuss how researchers were interpreting the data. Their reflexivity allowed for a more credible interpretation of the data by providing the reader with details on how the study's findings were developed.

Understanding qualitative methods, then, is not merely a process of learning procedures or specific methods but a process of understanding the implications of objectivist and subjectivist frameworks in conceptualizing research. These differences may require researchers to develop new fluencies in order to recognize credibility in varied forms.

Common Approaches to Qualitative Research

Many qualitative methods have been developed by researchers to gain insight into understanding an issue or phenomenon. The following sections highlight the most prominent qualitative methodologies within LGBTQIA+ studies.

Phenomenological Methods

Phenomenology refers to the study of lived experiences; thus, phenomenological methods in qualitative research generate knowledge about how participants make meaning out of their experience. Two major approaches to phenomenological methods differ in their emphasis on how much data are transformed during interpretation. The *descriptive phenomenological method* guides

researchers to adopt an attitude toward inquiry in which they set aside their own preconceptions, using procedures such as bracketing, to more accurately describe the essential aspects of participants' experiences. For instance, descriptive phenomenological researchers might seek to learn the central aspects of trans identities that seem constant across participants' experiences. A second phenomenological approach is *interpretive phenomenological analysis* (IPA), encouraging researchers to more deliberately use their perspectives when analyzing the data (rather than to set them aside). IPA embraces the interpretive stance of researchers in analyzing participants' experience. An IPA study might examine the experience of trans people without identifying the essential aspects across their reported experiences. Both approaches are well established and being used internationally.

Grounded Theory Methods

A defining feature of these methods is the inductive creation of a hierarchy of data categories that is capable of generating a theory "grounded" in the data. In the analytic process, researchers compare units to one another, identifying commonalities in meaning, and create categories that are grouped into an organized data hierarchy. A grounded theory study of trans people's body image might lead to a hierarchy of categories that describe key positive, negative, and neutral meanings, including subcategories that articulate specific self-evaluations within each group. Other defining features of grounded theory include data collection guided by *theoretical sampling methods*—in which researchers, within their ongoing analysis, intentionally recruit additional participants who have experiences with less well-understood aspects of the phenomenon—stopping recruitment at the point of *saturation,* where further data analysis no longer seems to yield new categories.

Narrative Methods

The narrative research approach includes a number of methodological variations that share the aim of understanding people's experiences within a narrative format through inquiry into the content of narratives, their function, their structural features, their evolution over time, and their production. Some of the variations in narrative methods include studying people's stories in isolation, their effect upon listeners, and their meaning within their historical and cultural context. Entire life stories can be examined, focus upon stories told within or about people's lives, or relate to specific topics or concerns. For instance, coming-out stories can be examined to provide a sense of common obstacles that LGBTQIA+ people face.

Discursive Methods

Discursive methods, including conversation and discourse analysis, are different from other qualitative methods in that they are mainly interested in the functions of language use, rather than understanding internal experience. Conversation analysis is focused on studying the relational patterns between speakers, whereas discourse analysis focuses on uncovering cultural and ideological assumptions embedded within language. Qualitative researchers using discourse analysis explore the use of linguistic devices in communication and their rhetorical impact. A qualitative study using discourse analysis within trans health care might examine how a guidance document, from a medical organization directed at medical practitioners, talks about working with trans patients, allowing the researchers to examine how attitudes toward trans people are communicated within medical contexts.

Ethnography

Ethnographic methods generate knowledge about social relations within a cultural context. Widely used in social sciences such as sociocultural anthropology and sociology, these methods aim to understand cultural and social systems. Through the use of lived experience, observation, and interviews with participants in the relational systems being studied, ethnographic researchers also use their positionality to articulate contextualized findings. Ethnography might explore interpersonal behaviors within a community, their attitudes and beliefs, or the use of symbols within a cultural group while describing the environment in which these phenomena occur. A trans-relevant ethnography might explore how queer bodies, as they relate to the development of gender identities within a

particular cultural context, are perceived and responded to by other community members.

Critical Methods

Critical researchers begin their analyses with an interest in analyzing how interpersonal and sociopolitical structures and processes function to support the privilege and power of dominant classes in society (e.g., in relation to gender, sexual orientation, race, socioeconomic class, ethnicity, immigration status). Researchers are interested in shedding light upon otherwise invisible forces of oppression and injustice that have become status quo. They also critique the research process and the ways science engages in actions that might perpetuate discriminatory practices and perspectives. Research conducted using these perspectives may engage quantitative and/or qualitative methods, as needed, to shed light on oppression and move toward emancipatory social change. Critical methods are central in trans-queer qualitative research and are compatible with participatory methods that engage an advisory team from the group under study, recruit coresearchers from that group, or engage participants to guide the development of the research question, research design, data collection, analysis, and/or application of findings.

Quality, Trustworthiness, and Methodological Integrity

Reporting standards indicate how rigor can be evaluated in research, and qualitative researchers have long sought ways to describe rigor in their approach. Trustworthiness is a concept often used in qualitative research to evaluate the worth of a qualitative research presentation, based in the judgments of its readers and its suitability to be presented to them in a convincing manner. However, trustworthiness as a concept may be influenced by evaluations that are not related to the research processes themselves (e.g., reputation of authors, congruence with readers' own expectations and beliefs, rhetorical style, or superficial features of presentation). In order to reflect specifically how rigor relates to the underlying methodological basis of a study, a concept called *methodological integrity* was advanced in 2017 by the Task Force on Resources for the Publication of Qualitative Research of the Society for Qualitative Inquiry in Psychology (a section of American Psychological Association, Division 5), in consultation with a broad range of leading qualitative researchers.

Rather than directing researchers to follow standardized checklists for using a certain method, which reflects the natural science values of uniformity of methods and reproducibility, methodological integrity is more consistent with human science, which values the flexible and creative use of methods to achieve study aims. By focusing researchers on the principles underlying research design, it provides a framework for researchers, reviewers, and consumers of research to evaluate the qualitative research findings solely by considering the logic underpinning a study's design and process. Methodological integrity comprises two composite processes: *fidelity to the subject matter* and *utility in achieving research goals*. Fidelity to the subject matter is the process by which researchers select procedures that develop and maintain allegiance to the phenomenon under study as it is conceived within their approach to inquiry. The researchers should communicate to the reader whether they believe the phenomenon being studied is understood as a social construction, as an existential given, or in another manner. By describing the process of analysis and including quotations from the data, researchers from across the different approaches can demonstrate that findings have been developed to represent commonalities found within the data.

A central element of fidelity is the management of reflexivity through both data collection and data analysis. When conducting research from a reflexive stance, LGBTQIA+ researchers will consider the hopes, expectations, and perspectives that they bring to their research and the ways in which they might influence their research. Reflexivity can act to increase the readers' trust in the findings by explicitly describing the way the investigator's beliefs were managed. Typically, researchers' perspectives are dealt with in two ways. First, by becoming aware of their beliefs, they can set them aside or find ways to limit their influence on the analysis. For instance, a trans researcher might realize that their own experience of medical affirmation procedures could influence their assumptions and interpretations of data. To avoid researcher bias, they might be especially cautious

during the data collection and analysis by using disconfirming questions in the interview and by working to broaden their understanding of the experiences that others have had with these procedures. They also might use procedures such as seeking consensus with other researchers when coding (or analyzing) data or inviting external auditors to review findings and provide feedback to help them see their data from multiple perspectives. In the second approach to managing the researchers' perspectives, the trans researcher might use queer theory as a lens that structures initial categories for their analysis. In this case, they would be very overt about the theory in use and its influence on the inquiry. This transparency would facilitate the fidelity of the analysis by making clear how it was performed.

The second core aspect of methodological integrity, utility in achieving research goals, is the process by which researchers select procedures that usefully answer their research questions and address their aims. The aims of qualitative research can be varied, including developing theory, identifying social practices, forming conceptual frameworks, raising critical consciousness, increasing sensitivity to an issue, and developing local problem-solving knowledge. The evaluation of methodological integrity must consider whether the procedures used to enhance fidelity and utility are coherent in relation to the researchers' goals, approaches to inquiry (e.g., philosophical assumptions), and study characteristics (e.g., the particular subject matter, resources, participants, researchers).

A central element of utility is the need for adequate contextual description that would enable researchers to make use of a study's findings in their own contexts. This detail facilitates *transferability*, the term for the generalizability of findings in qualitative contexts, which is the extent to which a qualitative study's findings are thought to transfer to other situations. LGBTQIA+ researchers will seek to enhance generalization by using procedures such as theoretical sampling, the process through which researchers seek out participants who might fill our gaps in their emerging understanding. By researchers grounding the findings in the data, describing the sample characteristics, and providing contextualized examples, readers are provided with information that permits them to assess the appropriateness of generalization.

To maximize methodological integrity, researchers may wish to consider how all aspects of the study function to enhance fidelity and utility, including participant selection, recruitment, data collection strategies, and data-analytic strategies, as well as broader aspects of the research, such as the formulation of research questions or the articulation of implications. Procedures used to check data collection or findings (e.g., asking participants for feedback) often are employed. Checks also may include incorporating triangulation along with other sources of data (e.g., data from quantitative analyses). They can strengthen the credibility of findings, though, as they are enhancing the methodological integrity of the method, goals, study characteristics, and qualitative inquiry tradition. The framework of methodological integrity recently has been incorporated into the seventh edition of the *Publication Manual of the American Psychological Association* and their reporting standards for qualitative research. This understanding of qualitative methods can guide readers to evaluate the contributions of trans research, as exemplified in the following section.

Examples of Qualitative Research on Trans Issues

As mentioned earlier, qualitative research can be particularly adept for studying topics of interest in trans issues. Qualitative inquiry provides researchers with methods that more complexly describe the social world in which people inhabit. In this section, we consider a few examples of LGBTQIA+ qualitative research and the contributions that they make to the literature.

Centering Marginalized Experiences

Qualitative research has long been commended for placing in focus experiences that fall outside of the average or dominant ones. For instance, Carmen Logie and colleagues, in their 2012 article, "'We Don't Exist': A Qualitative Study of Marginalization Experienced by HIV-Positive Lesbian, Bisexual, Queer and Transgender Women in Toronto, Canada," explored the experiences and challenges of LBQT women living with HIV in Toronto as they

try to access health care services. The research team was particularly interested in this population because it is one that is largely ignored and invisible, resulting from misconceptions about their lower risk for HIV transmission. Taking an intersectional theoretical approach, the research team noted how heterosexism in the forms of social exclusion and violence were significant structural risk factors for contracting HIV. Interestingly, the researchers identified a trajectory of structuralized marginalization, in which LBTQ identities increased participants' risk for HIV transmission, playing into further barriers to accessing health care and social services for HIV-positive people. Although looking at LBTQ women overall, the authors noted the variations within this experience, for instance, in how trans women experienced social exclusion in sexual minority communities through stigma around gender nonconformity, along with perceiving themselves as lower class.

Demystifying Forms of Systemic Oppression and Resistance

LGBTQIA+-focused qualitative research often makes evident forms of bias that might be invisible to people from dominant perspectives who do not face those same issues. In the 2014 published paper "Queer Habitus: Bodily Performance and Queer Ethnography in Lebanon" by Sofian Merabet, the anthropologist integrated ethnographic findings and theory perspectives to focus an understanding of a queer habitus: character traits that cultivate resistance against social oppression. In the context of a post–civil war Lebanon around the early 2000s, Merabet walks through the various "queer" urban topographies of an ever-changing Beirut. Guided by an informant, a local drag performer, the author posits the queer habitus through the various ways bodily performance comes to assert a queer presence in a city where even walking can be seen as a queer activity because of its construction being hostile to pedestrians.

Through the use of queer ethnography and the researcher's self-positioning reflexively as an active participant-observer, Merabet highlights bodily performances that challenge normative behaviors yet blend within particular culturally normed practices to play on the idea of creating a more "cosmopolitan" Beirut. These include such traditions as the celebrating of St. Barbara's feast day with men performing drag and the practice of *mazāhir* ("seeing" and "being seen" by others), which is manifested through large-scale "performance" in the street culture of Rue Monot. Through these findings, Merabet built evidence for the production of a queer habitus and produced an innovative understanding of how queer individuals influence urban topographies.

Encouraging Liberation and Emancipatory Practices in Mental and Physical Health Care

Within health contexts, qualitative research has been employed to guide practitioners and improve the quality of care for LGBTQIA+ patients. For example, in their 2018 article "Perspectives on Queer Music Therapy: A Qualitative Analysis of Music Therapists' Reactions to Radically Inclusive Practice," Catherine Boggan and colleagues evaluated LGBTQ+ music therapists' perspectives of the queer music therapy model with LGBTQ+ clients. The research team analyzed interviews with the music therapists, identifying oppressive systemic factors operating in the field of music therapy. The critical discourse analysis identified structural barriers related to the lack of intersectional diversity in music therapy training programs, the privilege needed to access therapeutic services, and a Eurocentric cultural music bias that more highly values the Western classical music tradition to the exclusion of other genres. They identified the strengths of the queer music therapy model in challenging heterosexism and cissexism, such as its use of a group modality that functioned to promote solidarity. Their critical method increased the fidelity of the research findings by guiding the researchers to interpret the subtle aspects of participants' experiences that appeared to be internalized as natural.

Qualitative LGBTQIA+ research is a growing area across many social sciences. A human science approach to Trans Studies is poised to allow researchers to develop a richer understanding of the complexities in the lives of LGBTQIA+ people, promote policies that advance social justice, and shape empowering interventions. Qualitative approaches to research can communicate solutions to problems that engage the self-determination and agency within trans communities. Their use within a critical lens lends itself to identifying, reflecting, and acting upon forms of systemic oppressions that affect trans

people and the communities in which they live. Qualitative LGBTQIA+ researchers are directed to enhance the integrity of their methods by increasing both the fidelity to the phenomenon being studied and the utility of the methods in meeting their study's aims. Through an improved understanding of diverse qualitative methodologies and epistemological perspectives in human science, trans research can continue to create insightful findings that have potent political and scientific implications.

Quantitative Research

This entry provides an overview of quantitative research on trans populations, with a focus on social and health science, using a Trans Studies lens. Following a brief discussion of this epistemological approach, the entry reviews the hallmarks of quantitative research on trans populations, including dominant etiologies and methodologies. A history of quantitative trans research and a discussion of contemporary approaches follows, with a focus on strengths and challenges of the field. The entry concludes with an examination of major themes of contemporary findings, a discussion of limitations, and directions for the future.

Epistemology

Trans scholars Susan Stryker and Stephen Whittle make a distinction between the "study of transgender phenomena" and transgender studies. The former encompasses quantitative, mixed-methods, and qualitative studies mapping the intersections between gender identities and roles, kinship formations, and the physiology of the sexed body (e.g., genetics, endocrinology, comparative anatomy). Trans Studies, by contrast, has epistemological roots in poststructuralist frameworks forged in queer theory and queer-of-color critique. Keeping Trans Studies' critical epistemological framework in mind, this entry aims to incorporate two methodological propositions for analyzing trans quantitative research. First, it attends to the political and epistemological relevance of lived trans experience. Second, it attends to the inherent power dynamics of knowledge production and dissemination. In turn, attention is paid to the sociopolitical contexts and unspoken epistemological and moral investments implicit in quantitative literature.

Defining Quantitative Research

Much but not all quantitative research, including transgender quantitative research, reflects a positivist

approach—the idea that knowledge can be generated by observing facts and patterns, which in turn can be used to make predictions and develop interventions. Researchers generally begin with a theory to generate a hypothesis that can be tested deductively, done by selecting and collecting numerical data from an observable population. Data are statistically analyzed in order to examine overarching characteristics, explore relationships between data points, and make causal inferences. Perhaps the most important difference between quantitative and qualitative approaches is the assertion that quantitative research is generalizable and therefore representative of the chosen population as a whole. Generalizability, however, depends upon availability and quality of constructed samples—a particular challenge in trans research.

Historical Legacies and Antecedents of Trans Research

The quest to examine sexual and gendered difference began largely within Europe and North America beginning in the late 19th century. Initial research focused on monitoring and regulating so-called sexual deviance and nonnormative sex-based characteristics. This project—to define the characteristics of gendered/sex difference and its associated perversions—was often a deeply moralizing enterprise. Early writings and research promoted white, cisgender, heterosexual subjects as normative in order to sustain biological reproduction of the Euro-American industrial nation-state and regulate the productive capacities of colonized territories and people abroad. These writings defined gender as fixed, binary (either man or woman), directly tied to reproductive anatomy, and associated with prescribed social roles.

The study of trans phenomena influenced the development of biomedical and social science subdisciplines within the fields of psychiatry, sexology, endocrinology, and psychology, among others. These disciplines, historically dominated by white cisgender men, generated clinical, case-based writing about gender, sex phenomena, and gender dysphoria. Key principles from these clinical case studies were influential in shaping clinical treatments and biomedical services for trans-identifying people and continue to affect trans quantitative literature to this day. These principles include (a) an assumed correlation between sexuality and sex/gender expression and identity (first captured in early sexologists' definitions of "deviant" sexuality) and the related concept of "sexual inversion" (the possession of a gender that was opposite to or inverted from the gender assigned at birth), (b) the separation of mental or psychological sex (i.e., gender identity) from physical sex, (c) an investment in understanding the etiology of trans identity as either a genetic or an endocrine condition or a psychoanalytic phenomenon ("transsexuality" as expression of pathological psychosocial development during early childhood), (d) transness as a psychopathological condition deviating from a strict gender/sex binary (captured in terminology such as *gender dysphoria* and *gender identity disorder*), and (e) gender identity as immutable (and aligned with a strict gender/sex binary and normative, heterosexuality) rather than fluid and diverse across space and time.

Methodological Dilemmas Associated With Trans Research

Difficulties with measurement and sampling in trans research are widely discussed in the literature, highlighting several overlapping dilemmas for quantifying trans populations. One issue relates to how researchers define who is, or might be, a trans person. There are no standardized criteria for who should be counted as trans, leaving each research study to develop its own definition and causing wide variation between studies. A related issue is that one cannot calculate a prevalence estimate among trans communities without an overall estimate of the size of the entire trans population. In the absence of a clear measure of the entire population, many studies have relied on approximated estimates as the denominator in prevalence calculations. Thus, across studies, there is no standard denominator.

Another dilemma concerns tensions between a more subjective understanding of self-identification and demands of identification in a quantitative research context. In early research, trans individuals were identified by others, usually through medical or clinical diagnoses or type of medical services received (e.g., a gender clinic). Only recently have studies developed samples of self-identified trans individuals. While self-identification is preferable

for social and political reasons, challenges remain. To create a sample, one must define at a single point in time who is included or excluded. As a result, researchers often provide definitions of a particular gender identity that a participant is asked to endorse. Researcher-provided definitions of trans identity vary across studies, rendering cross-study synthesis challenging. In addition, standardized measures, drawn upon for determining study eligibility and for use in statistical analysis, run the risk of reducing complex social experiences into single categories (such as trans, non-trans) at a single moment in a life trajectory and often fail to capture the nuanced ways people understand or express their gender, especially if these vary by social context or over time. Creating narrow definitions of gender identity and expression excludes those who exist outside of researcher-defined norms, giving researchers the power to define the population according to their own ideologies. Finally, trans individuals may be reluctant to self-disclose gender identity for fear of being stigmatized or discriminated against.

It is necessary to interrogate how researchers consider or ignore differences *within* and *between* trans and cisgender people with varying social identifications. Historically, research lumped nonnormative gendered and sexual identities/experiences together (e.g., studies of "LGBT" people). This tendency to conflate sexuality with gender reflected precedents set by early sexologists' definitions of sexual deviance. In more contemporary work, these populations have been separated, recognizing the distinction between gender identity and sexual orientation. Yet, dividing populations by a single identity (e.g., gender) can obscure how intersections of social identities shapes differential outcomes and experiences. Furthermore, even within the single identity category of gender, existing research often elides nonbinary experiences by lumping them together with their binary trans counterparts, despite a growing body of work suggesting important differences between these populations. To better reflect the complexity of trans lives, some quantitative researchers are now deploying an intersectional approach to study designs. As an example, research examining the intersections of race, class, gender, and sexuality in the lives of trans youth demonstrates that queer trans youth of color experience bullying at higher rates than do their white trans peers. By deploying an intersectional lens to trans research, researchers can draw critical attention to the ways in which relations of power such as racism, homophobia, classism, ableism, and transphobia intersect to shape the experiences of study subjects.

The application of standardized measures to trans people is also fraught with complications. For instance, things that are pathologized in cisgender populations may be normative experiences for people who identify as trans. One such example is evident in scales assessing for dissociation, which often ask if people feel disconnected from their bodies. For trans individuals, this experience may be part of their identity development, rather than a symptom of a disorder or trauma response. These and other psychometric tools fail to capture trans individuals' complex experiences navigating diverse social spaces where their body selves are being evaluated and/or regulated in relation to a web of normative cultural values or, at times, validated through trans-affirming interactions. Such measures also recast coping skills or trans identity as pathology. Given that trans people appear to have higher rates of depression and anxiety, attention to the measures being used to determine such diagnoses and their accuracy for use in trans populations is critical. Recent work in this area has either adapted or developed scales for specific use within the trans community, for instance, the trans discrimination scale.

Of note is the need for quantitative researchers to turn critical attention to institutions' use of social categorizations to regulate and normalize gender expression. According to trans activist and scholar Dean Spade, biopolitical mechanisms of power are mobilized at a structural level by racialized and gendered regimes. State-level administrative processes depend on the systematic categorization of individuals based on particular traits. These categories have extreme ramifications on the physical safety of trans lives, especially when compounded by other forms of systemic violence such as racism and homophobia. Notably, trans individuals face significant vulnerability to violence in rigidly gender-segregated institutions, especially those that are mandatory in nature (e.g., prisons, homeless shelters, psychiatric treatment facilities). For example, incarcerated trans people are 5 to 6 times more likely than the general

incarcerated population to be sexually assaulted by facility staff and 9 to 10 times more likely to be assaulted by another inmate.

Dominant Themes in Quantitative Trans Research

Quantitative trans research has predominantly focused on several major areas, including demography of trans communities, experiences across the life span, discrimination, and health behaviors and outcomes.

Demography of Trans Communities

Population-based estimates of the size of U.S.-based trans communities are inconsistent at best. Systemic reviews highlight the heterogeneity among prevalence studies, specifically a lack of definitional clarity about what constitutes a case, as well as the appropriate denominator in prevalence equations. The most frequently cited statistics about the size of trans communities come from the Behavioral Risk Factor Surveillance System (BRFSS)—a national health survey with a standardized set of core questions and add-on modules available at the state level. A sexual and gender identity module was included for the first time in 2014. On the basis of data from states that adopted this module in 2016, the BRFSS estimates suggest that approximately 1.4 million people who are trans live in the United States. These estimates are based on a generalization of data from only 19 states. The U.S. Census continues to offer a binary choice of male or female as a gender response, despite calls for a more trans-inclusive approach. Changing the census question, or including the BRFSS gender question in the core BRFSS questionnaire, would be helpful in this area. TransPop, a collaboration between an LGBTQ+ think tank, two universities, and an LGBTQ+ health center, will be the first probability sample of trans individuals across the United States and will help fill a gap in this area. Early work from the TransPop study has focused on parenting and COVID-19 risk in the trans population.

Experiences Across the Life Span

The developmental process of trans identity and the act of "coming out" is a contested area of study within the field of trans research. While an influential body of literature has examined the developmental trajectories of trans individuals using linear, stage-based frameworks, trans activists and scholars highlight a need for more flexible and less linear approaches. Contemporary research collaborates this charge, suggesting that trans-identified individuals reported more diverse transition trajectories than was previously assumed. Additionally, many of these models assume that an individual will eventually reach a binary gender identity (man/woman), while trans scholars and activists highlight the fluidity of gender identity and expression beyond the binary. More intersectional research is required to examine how issues of race, class, ability, and sexuality shape the nature of coming-out trajectories and are determinants of different social pathways. Advanced statistical methodologies that tease out nonlinear relationships could be generative in this regard.

When trans youth come out, they face stressors at home and with peers. Approximately one-third of LGBTQ youth report experiencing parental rejection, with trans youth likely to experience higher rates than their LGBQ peers. The frequency of family rejection results in overrepresentation of trans youth in both homeless and child welfare services where they face a lack of trans competent providers and caregivers. Bullying and harassment of trans youth is common in schools, and the overarching school climate can either exacerbate or ameliorate such aggression. Trans youth who remain enrolled in school show poorer grade point averages compared with cisgender youth, and a disproportionate number of trans youth are involved with the juvenile justice system, especially youth of color. Perhaps, then, it is unsurprising that trans youth are at higher risk of depression and anxiety than their cisgender peers. According to one study, the rate of suicide attempts is highest among transmasculine young people (51%), followed by nonbinary young people (42%) and transfeminine young people (40%).

Research on transgender parenting is still in a nascent stage. Demographic studies suggest that one third to one half of trans people are parenting, with differences between subgroups (e.g., those who came out later in life are more likely to parent than those who did not). The research has largely been defensive in nature, focusing on child outcomes and finding no negative effects of trans

parentage. Trans parents experience discrimination in a wide variety of settings, including pediatric practices and their children's educational systems. Several studies identify unmet social service needs for this population, including family planning. This area of research largely examines white participants and their families and often reflects homonormativity (e.g., focuses on biological reproduction rather than adoption).

Trans elders are largely excluded from existing quantitative research pertaining to aging populations. Within the past decade, the first out population of trans elders has begun to navigate the challenges surrounding end-of-life care. Despite their emerging visibility, researchers still lack sufficient data to make accurate population estimates for trans elder populations in the United States. Such estimations are complicated by a general hesitancy to self-identify, erasure in many standardized data-gathering instruments, and abuse of trans individuals in institutional settings, resulting in distrust and fear of care providers by trans elders. Census estimates suggest that there could be between 1.2 million and 2.8 million trans-identified individuals aged 65+ living in the United States. The Trans MetLife Survey on Later-Life Preparedness and Perceptions in Transgender-Identified Individuals (TMLS) represents the largest internationally distributed survey to date of trans-identified elders. Reporting on results from the TMLS, computer science scholar Tarynn Witten found that 40% of survey respondents feared that they would be treated unfairly and inconsiderately in most eldercare facilities. Other studies provide evidence suggesting trans-identified elders have much higher levels of depression and lower levels of self-acceptance than their cisgender peers.

Experiences and Effects of Discrimination

Trans adults are victims of harassment, violence, and premature mortality. According to the report on the 2015 U.S. Transgender Survey, 46% of respondents had been verbally harassed within the past year, and 9% had been physically attacked for being transgender. Research on trans adults also indicates that trans people of color and those who identify on the transfeminine spectrum are disproportionately affected by violence compared with other members of LGBTQ+ communities.

Trans-identified adults are also more likely than their cisgender peers to face barriers to seeking employment, be underemployed or unemployed, or face discrimination and harassment or barriers to employment opportunities (e.g., promotion, wage increases) in both private- and public-sector work. This may be a result of inconsistently applied gender identity–based antidiscrimination protection for private-sector labor across the United States. In addition to transphobia and its related violence, other barriers to employment include the inability to secure identification documentation that matches one's gender identity, disrupted education and family life, experiences of housing insecurity and episodic homelessness, how people are gender coded, and, relatedly, whether people disclose their gender identity. When compounded by racism and ableism, rates of unemployment and underemployment are higher for trans people of color, trans people with disabilities, and those at the intersection of these identities.

Experiences of homelessness or being precariously housed (either episodically or chronically) are disproportionately high in transgender communities. Given that the majority of homeless shelters segregate by sex assigned at birth or have insufficient gender identity–based discrimination policies in place, evidence suggests that 25% of trans individuals experiencing homelessness avoid shelters. When trans people gain access to shelters, they experience poor treatment or harassment by staff and other residents because of their gender identity, or they are forced by shelter staff to present as the wrong gender in order to secure a bed. An intersectional lens reveals increased rates of housing discrimination and homelessness for Black trans people, Indigenous trans people, and trans people of color when compared to their white and cis peers.

Up to 20% of trans individuals engage in some form of criminalized labor such as survival sex work and/or drug sales. Rates of participation in survival sex work are higher for trans women of color, trans-identified Indigenous and Black women, and undocumented trans women. Race- and class-based explanations for these differential rates remain unexplored. Most studies point to negative outcomes for participation in sex work. Associations are documented between trans

women's participation in sex work and experiences of homelessness or housing precarity, substance use disorders, experiences of violence by a known partner, elevated risk of HIV and being sexually assaulted, and, if involved in street-level sex work, risk of being harassed or assaulted by police. Evidence also suggests that these interactions can lead to arrest and further violence at the hands of law enforcement. Overlooked in the quantitative literature, broadly, is the investigation of sex work as a viable form of labor for overcoming economic instability or as a source of empowerment.

Health, Behavioral Health, and Its Social Determinants

Research on trans health and behavioral health constitutes the bulk of quantitative research on trans populations. However, most of this research focuses not on general health but rather on risk behaviors among trans people, including high rates of substance use, sexual practices, and use of illicit drugs and nicotine. Although the AIDS epidemic is often referenced as the reason for the discrepancy in the scholarship, it is also likely the result of the sexualizing of trans bodies and the use of a pathologizing lens. Behavioral health research highlights disproportionately high rates of mental illness among trans youth and adults, with a focus on suicidality and its outcomes. Access barriers to health and behavioral health care are well documented and include financial barriers (e.g., lack of insurance), unavailability of trans-specific services, and experiences of discrimination from general health practitioners and their institutions. When an intersectional lens is applied, findings illuminate that systemic racism, classism, ableism, and issues of citizenship compound experiences of cissexist discrimination and contribute to greater inequities in health outcomes and barriers to seeking treatment and care. For instance, trans individuals of color are less likely to access trans-affirmative care under Medicaid compared with their trans white peers. Researchers are also just beginning to recognize differences of gendered identities and embodiments within the trans community (e.g., seeking to understand how nonbinary identity may uniquely affect health).

Areas for Future Research

Measurement dilemmas cross most of the social science, health, and behavioral health literatures and affect these fields' ability to produce generalizable findings regarding trans people. The technical needs of quantitative research with its attendant focus on issues of validity and rigor through an increasing standardization of measures can conflict with the complexities of lived trans realities. To date, research on the life span of, social conditions experienced by, and the resulting health and behavioral health outcomes for trans people is largely deficit focused and driven by disease models that pathologize trans lives in terms of behavior and risk. Instruments specifically designed to measure the lived realities of trans people are in a nascent stage, as is a recognition that existing measures are insufficient. Intervention research beyond that focus on sexual and health adherence is lacking, particularly with regard to social determinants of health.

Over the past decade, trans community activists and scholars have been instrumental in championing a movement toward greater trans community control or at least consensual involvement in co-shaping study design and managing research processes. Many of their efforts mirror the gaps in current research, for instance, creating measures that shift away from pathologizing trans experiences and creating community-driven research agendas. These activists and scholars are forging a path into the future whereby advanced quantitative methodologies could be deployed to understand the complexities of lived trans experience, rather than focus on the myriad results of systemic oppression on the living conditions and health of trans people.

A Trans Studies lens demands that the field adopt intersectional approaches to trans research that disrupts the white, Western-centeredness of most quantitative studies. Central to this project are quantitative analyses exposing the complexities of trans experiences. This implies critical examinations of the ways in which privilege and oppression are lived differently by trans individuals and communities occupying a variety of social locations, as well as how ideological and institutional white supremacy, ableism, capitalism, neoimperialism, and other oppressions converge and manifest in anti-trans discrimination and animate trans people's resistance. While it is crucial to

explore the intersectional oppressions that order trans people's lives, quantitative studies that emphasize and examine trans people's daily resiliency, activism, social networks, and survival practices are essential to exposing and understanding the full depth and breadth of trans lives.

Queer, Intersections With Trans

This entry considers the intersection of LGBQIA+ and trans identities. This is initially discussed using the historical context of LGBQIA+ trans individuals and is followed by a more contemporary understanding of LGBQIA+ trans identities. The entry concludes with a discussion of potential directions needed for expanded research in the area of LGBQIA+ trans identities.

Basic Definitions

Trans individuals, like cisgender (cis) individuals, may have a myriad of sexual identities and orientations. The present entry focuses directly on trans individuals who do not identify as heterosexual. Explicitly, these individuals sit at the intersection of gender and sexual minority identities and are thus marginalized at this specific intersection. These individuals may find support as well as tension from both the trans and the LGBQIA+ communities. Furthermore, although these individuals exist within and identify with both communities, it is important not to conflate the gender and

sexual minority communities. Instead, this encyclopedia entry acknowledges gender and sexual minority identities as two separate yet interacting constructs that affect not only LGBQIA+ trans individuals but also individuals of any gender and sexual configuration.

Historical Context

Throughout the history of conceptualizing LGBQIA+ trans individuals, many have sought (whether intentionally or unintentionally) to erase the experiences of trans individuals who were sexually and romantically attracted to the same gender as their affirmed gender. One of the approaches that has worked to further this erasure is the autogynephilia movement. Conceptualized by Blanchard, *autogynephilia* refers to a classification of transfeminine individuals who were deemed to be "heterosexual fetishistic transvestites," or transfeminine individuals who were romantically and sexually attracted to other women. This label pushed the idea that trans women were sexual fetishists and that lesbian trans women were not actually attracted to other women but were attracted to the idea of themselves as women. As there is little empirical basis for this classification, the autogynephilia label underscores the underlying biases and assumptions that lay the foundations of the theory itself.

Intersections of LGBQIA+ and Trans Identity

According to the U.S. Transgender Survey (USTS) conducted in 2015, less than 18% of trans individuals identify as straight or heterosexual. Even so, the majority of research that focuses on the sexual and romantic relationships of trans individuals assumes that most people within this population identify as heterosexual. As results from the USTS show, the assumption that most trans individuals are heterosexual is not only incorrect but also erases the experiences of nonbinary trans individuals. This erasure, intentional or not, is due to the fact that heterosexuality implies a binary gender dichotomy, something that nonbinary individuals may not identify with or see as relevant to them. Like cis individuals, trans individuals' sexualities vary, although limited empirical research acknowledges or explores this variability. Scholarship in the area of trans individuals' sexual identities and romantic relationships primarily focuses on the cis partners of trans individuals.

Furthermore, trans individuals' sexualities may have relationship configurations and sexual power dynamics that are more fluid than those of cis individuals. Focusing explicitly and singularly on the biological sex of the individuals involved in these intimate relationships may render some of them to be illogical. For example, a trans man sexually and romantically attracted to women is not to be categorized as a lesbian, as those scholars who focus only on biological sex would seek to categorize him. Furthermore, power dynamics may play a role with trans individuals who choose to partner with cis individuals. As with any relationship in which one partner holds a minority identity while the other does not, experiences of these couples may show a societal power dynamic in which the cis partner inherently enjoys more systematic benefits than the trans partner does. Thus, negotiations in relationship dynamics, such as division of labor, disclosing trans or sexual minority identities, or sexual intimacy, are all dynamics that must be navigated within the relationship. Furthermore, LGBQIA+ trans individuals may experience rejection from the sexual minority communities that they are a part of, owing in part to experiences of biological essentialism and distilling trans individuals down to their genitals instead of their gender identities.

LGBQIA+ trans individuals may also have more fluid ideas around sexual configurations than their cis counterparts. Although many trans individuals choose to monogamously partner with one other individual, others choose to partake in ethical or consensual nonmonogamy or polyamory. This may be in part due to the idea of challenging heterosexuality that is embraced and performed by the LGBQIA+, trans, and polyamorous communities.

As previously stated, trans individuals have sexualities that are as varied and rich as those of cis individuals. While the majority of trans individuals identify as not heterosexual, little research has been done on the exact intersection of having both an LGBQIA+ identity as well as a trans identity. However, this unique intersection may present some challenges for trans individuals. By nature of their history of a gender transition, many trans individuals describe *queering* sexual identity.

Instead of seeing sexuality as something that is immutable and permanent, some trans individuals may see the notion of sexuality as something that is fluid, alterable, and rational, instead of something that is "fixed" to their authentic self.

Experiences of LGBQIA+ Trans Individuals at the Intersection of Multiple Marginalized Identities

Trans individuals who identify as LGBQIA+ may be seen as experiencing marginalization at the intersection of their gender identity and sexual orientation. This is because LGBQIA+ trans people inhabit spaces that occupy at least two minority groups: sexual and gender minorities. Trans individuals are disproportionately more likely than their cis counterparts to be homeless, live below the poverty line, or experience harassment or discrimination by law enforcement and police. Similarly, individuals who identify as sexual minorities are at risk of being fired from their job due to their sexual identity and more likely to be turned away from services than their heterosexual counterparts.

By combining two marginalized identities, LGBQIA+ trans individuals may experience *multiple minority stress*, the stress that occurs when cisgenderism and heterosexism intersect to form a compounding stress that is different from experiencing cisgenderism or heterosexism alone. Through these feelings of multiple minority stress, individuals may not feel accepted within either group that they belong to. For example, some trans individuals may be rejected by the LGBQIA+ community (e.g., due to the presence of trans exclusionary radical feminists), while LGBQIA+ trans individuals may be excluded from the LGBQIA+ community for their perceived heterosexuality. Minority stress at the intersection of gender identity and sexual orientation and the social oppression that it is derived from takes a toll on the health of the individuals that it affects.

This intersection also disproportionately affects trans individuals who are disabled, religious minorities, and racial and ethnic minorities. Being situated at the unique intersection of various minority identities not only works to facilitate feelings of minority stress due to one's being a sexual minority but may also affect feelings of belongingness to a racial, ethnic, or religious community. LGBQIA+ trans individuals are specifically looking for spaces to feel welcome and may attempt to access spaces that should feel validating but where, in reality, they are disenfranchised and discriminated against due to their other minority identities.

Sexuality Changes via Hormone Replacement Therapy

Although sexual orientation has previously been conceptualized as being static across life stages, a phenomenon has been reported in which trans individuals have noted shifting sexualities during a medical transition. While it is understandable that some shifting of sexualities may occur due in part to the way society labels sexuality (e.g., a trans man may identify as heterosexual after his transition, as he retains the attraction to women that led him to identifying as a lesbian before coming out as trans), there are other trans individuals who experience a shift in the gender that they may be attracted to sexually and romantically following a gender transition. Specifically, research indicates that transmasculine individuals who use testosterone as part of their medical transition may experience an increase in their attraction to cis men. Current scientific literature is unsure, however, as to whether or not this change in sexuality is directly tied to testosterone. This phenomenon has been noted both anecdotally as well as in the research literature. Conversely, many transfeminine individuals note that their attraction to other women did not change when starting hormone replacement therapy (e.g., estrogen).

Nonbinary Sexuality

Within the United States today, the gender binary is implied in almost every relational context, including sexuality. Nonbinary individuals, then, may have a difficult time determining whether or not they fit romantic scripts that their partners may assume for them. As sexual orientation is one of the identities an individual has that is rooted primarily in the identity of others, it may be difficult for nonbinary individuals to find which labels may work for them and which do not. Previous conceptualizations of sexual identity such as the Kinsey Scale or the Storms Sexuality Axis have excluded attraction to, and of, nonbinary individuals.

In terms of labeling sexual identities, nonbinary individuals may face difficulty finding a label for themselves that they deem fits. Even labels that are meant to encompass attraction to more than one gender identity (*bisexual*) may feel limiting and rooted in binary assumptions. Many individuals who identify as nonbinary have moved from identifying in ways that assume a gender binary to more broad terms such as pansexual and LGBQIA+. By using labels that do not inherently enforce a gender binary, nonbinary individuals may attempt to reconstruct previously used language in order to create meaning out of labels that are most authentic for them.

Conclusion

LGBQIA+ trans individuals cover a range of marginalized identities that may extend beyond gender and sexual minority identities. Individuals who hold both sexual and gender minority identities have been historically disenfranchised or seen as "less than" trans individuals who hold heterosexual identities. Furthermore, previous conceptualizations regarding trans individuals as exclusively heterosexual work to erase the sexual identities of nonbinary individuals; this is rooted in exclusively binary heterosexist ideas of sex and gender, and it fails to conceptualize these ideas in ways that acknowledge fluidity in sexuality. This sexual fluidity may be derived from hormone replacement therapy. Understanding the intersections of LGBQIA+ identities and trans identities may shape the way that clinicians, researchers, and educators work to further expand the field and acknowledge this population.

Queer Theory and Trans People

Since the 1980s, theorists in the fields of sociology, gender studies, philosophy, and sexology have radically transformed theoretical perspectives on transness, gender transition, and the concept of gender more broadly. Many of these theorists have been grouped into a field often referred to as queer theory (QT). QT has provided a set of tools and frameworks that hold the potential for more in-depth and nuanced

understandings of the ways transness interacts with societal norms, interpersonal relationships, and the human body itself. This entry explores the leading queer theory perspectives on the lived experiences of trans people, including embodiment, liminality, performativity, and failure. The limits of QT are also considered.

Embodiment

Contemporary public discourse around trans people and transitioning centers on the intentional physiological and aesthetic shifts that signal a person's engagement with a gender transition process. This process can involve hormonal, surgical, behavioral (e.g., voice or gait training), and sartorial changes that indicate a person has transitioned from one gender to another. However, this focus on what can be clearly seen by others provides an incomplete picture of the embodied experience of transness and the transition process.

Even if a trans person chooses not to change any of the above factors in their life as part of coming into their transness, the fact of their transness is in itself a material reality that sits first and foremost within their body. Each trans person is forced to experience their body in a way that situates it in opposition to current ciscentric societal narratives. QT provides multiple approaches to consider how trans people's bodies are understood within and without, ranging from the abject to the highly transformative. The following are some of these embodied figures, understood as archetypes etched into the Western collective subconscious, which QT has used to denote the reality of "the trans person."

"The Monster"

Trans bodies have often been compared to or conflated with monsters, chimeras, and other figures that strike mythological fear into the hearts of others. This perspective of trans people as monsters, and therefore as fundamentally inhuman, is one that has often been used to fuel fearmongering and hate campaigns against trans people. But QT allows us to contemplate what exactly we are so afraid of. The answer goes beyond abjection; repulsion alone does not yield the sort of vitriol aimed at trans people.

In reality, the monster is a figure that reflects to a society what that society fears confronting and is far more like us than we would like to admit. At the same time, it is something physiologically distinct from the "average" human. In the typical monster tale, the monster is wholly connected to its nature, unchained from the narratives of normalcy spouted by the (often weaker) villagers. Its body is not like those of the villagers, or so they think. If taken literally, it is understandable that a person would fear a real-life Frankenstein creature or werewolf in their midst. After all, the standard story is that these monsters bring with them death and destruction. But to the keen observer, the (trans) monster is not hell-bent on destroying people and places; rather, it is here to destroy old paradigms, thereby making us see who we are, who we can become, and the fear-inducing power that comes with embracing the aspects within us that exceed the horizon of gender as we currently understand it. Even as we burn at the stake, we reflect society's misdeeds to itself and highlight the transformative potential that is lost in the process of our persecution.

"The Cyborg"

Most common narratives of transness focus on the aforementioned physical pillars of transition: hormones, surgery, clothing, and behavior. These shifts are often understood as necessary means for a person to bring forth their most authentic self, aligning their physical appearance with what is already inside. In this story, physical interventions and modifications are simply tools to be used, meaningless except as aids in the trans person's journey into authenticity. However, this story of alignment and inner truth is radically disrupted by the QT figure of the cyborg.

The cyborg is a modified human; it too has undergone significant physiological shifts to achieve its final form. Where it differs is in its relationship to the tools and processes used upon its body. The common trans narrative is subtractive: It situates the cutting away of flesh and changing of its costume as actions that reveal a fundamental truth about that person. But the cyborg is additive: Each new modification is a discovery, a movement forward (or sideways). It is not unveiling; it is updating. Each new version may have

some likeness to the previous one, but the cyborg is truly a new and ever-improving machine at each stage. The (trans) cyborg's body is therefore not simply a vessel for actualizing what is already there. Rather, it is an ongoing project—a living, breathing science experiment, with outcomes unknown. Its body and its gender are subject to flux, setbacks, and unanticipated evolutions. In sitting with the cyborgian potential of human bodies, trans or otherwise, we become privy to the ever-changing nature of gender and our capacity to actively participate in that process.

"The Eternal Adolescent"

A third figure often invoked in QT is that of "the eternal adolescent." Trans people who choose to undergo hormone replacement therapy or other hormone-altering procedures such as orchidectomies experience what is essentially a "second puberty," wherein their bodies are literally thrown back into the hormonal processes of adolescence. These include changes in fat distribution, body hair density, and other significant shifts that most people have only had to experience once in their lives.

The figure of the eternal adolescent is not, however, simply a reflection of the physiological transformations many trans people undergo as part of their transition. Instead, the eternal adolescent is a figure lost in time. They have been unmoored from the conventional, normative timelines of adulthood, success, and relationship to the body. The eternal adolescent carries the stereotypically risky, rebellious, and oppositional mind-sets and behaviors of teenagers beyond the threshold of adolescence; the turmoil of self-discovery, of a burgeoning sexuality, and of intensively exploring gender, bodies, and aesthetics is transported into periods of people's lives often associated with settling down, "growing up," and other notions of permanence and inner deceleration. Eternal adolescence may look like a person who decides to pursue transitioning in their 50s or 60s and upturns their life or someone who has embraced the fluidity of gender early on and continues to change how their body exists and is perceived into their "adult" life. This (sometimes constant) state of flux is not only representative of the eternal (trans) adolescent but also of how QT approaches the concept of gender itself.

Liminality

A pillar of QT is the way it challenges notions of physiological, psychological, spiritual, and societal permanence. Fundamentally, QT suggests that "transness" is simply a part of the broader complexity of the world; trans people are not necessarily uniquely separate from their cis counterparts but rather are enacting ways of existing that engage with the messiness of gender, thereby revealing the ways it is hard to define, grasp, or even witness. However, QT does not provide a singular voice on the liminality of trans embodiment and conceptualization.

Some theorists view any type of so-called queer existence, including transness, as being a set of embodiments and actions that directly negate any consolidation or coherence. Queerness is viewed as disruptive in and of itself, introducing not only ambiguity and pathlessness to normative notions of gender but also other linear life aspects such as marriage and procreation. In the context of transness, this perspective hinges on the ways that transitioning, both socially and medically, makes all of the above categories unstable or nonviable. The fact that a person may move from one gender to another, embrace multiple genders, or reject gender altogether casts a long shadow over any kind of certainty around the limits and rules of gender. Similarly, the social rejection often experienced by trans people is viewed as a catalyst for the formation of familial, romantic, and friendship networks that defy any expectations of normative Western social structures. Last, transition-related medical interventions often prevent trans people from producing children, thereby setting them permanently apart from most of the nonqueer world in terms of the common narrative of monogamy and marriage leading to children.

The QT view of queerness/transness as negating social standards places all trans people as permanently "on the outside" of society, incapable of, or uninterested in, aligning with social expectations. This is often the case even for those who elect to blend or who try to "pass." Transness can be directive resistance, but it is also in and of itself a lived experience, which results in significant separation from cis-heteronormativity, regardless of the actions any particular trans person may take.

Other theorists offer more integrative understandings of the liminality of transness; they see gender as complex for everyone and position trans people less as outsiders and more as pioneers and explorers of new potentials. QT suggests that trans people are simply people who actively engage with the innate liminality and fluidity of gender and that their existence is a signpost for all others to consider that potential within themselves. This extends the sense of liminality beyond any individual trans person and instead positions gender as a precarious construct that is immaterial, impossible to name, and yet one that each person, trans or otherwise, has an active role in shaping and embodying. Within this framework, transness is not an innate biological or psychological process but rather a person's passage past a gendered threshold that delineates their experience as one that questions or defies the gender binary.

In this sense, QT provides a split view of transness. On one hand, it can be seen as a radical and unique lifeworld that could never be fully understood by cis people. On the other hand, QT suggests that all people have the potential to actively engage with their gender and mold it as they desire, with trans people positioned as beacons of liminality that we can all swim toward. This divide is in and of itself a show of the liminality and slipperiness of transness; the further any group of theorists explores gender, the more it becomes bifurcated and impossible to quantify. This has as much to do with gender as a construct as it does with the ways in which it is enacted within different individuals/groups/societies. In order to gain an understanding of the complexity of this enactment, it is important to consider the role that theories of performativity play in QT.

Performativity

The term *performativity* was first coined by Judith Butler as a means of exploring the role each person plays in creating and re-creating both their gender and the concept of gender more broadly. "Performing gender" might be physical (e.g., clothes, hormones), but it also might include more complex inner workings that are nonetheless tied to how the person exists in the world and how their gender is shaped by that reality. In this framework, "performance" is not something that is disingenuous or separate from a person's inner core; rather, it is a manifestation of a set of gender-oriented choices a person may make.

Performativity often comes into conflict with other theories of gender, particularly those that position gender as innate and unaffected by a person's behaviors and choices. If our gender is something fundamental, then the idea that we are performing it in any way may be seen as undermining its supposed naturality. Performativity, however, can help us understand how gender plays out internally, relationally, and socioculturally.

At its essence, QT suggests that each person's understanding and enactment of their gender contributes to how their gender is understood by oneself and others, as well as adds more information to our collective understanding of gender. Whether transgressing or aligning with cultural scripts of gender, we create and re-create gender as a system. Performativity can be used as a lens to examine other gender theories, particularly as a way to look at the "root" or "truth" of any particular gender or gender system, and several frameworks have been developed within QT to do just that.

First, José Esteban Muñoz's notion of "disidentification" provides one of the more straightforward ways to use performativity. Within this framework, trans people may contend with normative and, at times, stereotypical scripts about gender by situating themselves both within and against these scripts. For example, trans women may feel aligned with many of society's expectations of womanhood (e.g., wearing makeup and a dress). There are also trans-specific scripts, which for trans girls include supposed submissiveness, heterosexuality, and overwhelming body dysphoria. However, many trans women defy some if not all of these expectations; they might be dominant, queer, and have no desire to have "bottom surgery." These seeming contradictions might cause some trans women to distance themselves from the concept of womanhood, as the puzzle pieces simply do not seem to fit. But many "disidentify" with the script of trans womanhood; they partly form an affinity and partly disrupt and critique the static and unaccommodating nature of this gender narrative.

Second, Eve Kosofsky Sedgwick provides a framework for understanding these supposedly disparate scripts as narratives that exist *beside* one

another. The cultural narrative of transness largely goes as follows: A person grows up being perceived as cis, figures out that their gender is different from how they were raised, undergoes a personal transformation, and thereby "uncovers" their authentic trans identity. In short, their "true" gender needed to be revealed from beneath the mask they had been forced to wear by society. This script may apply in broad strokes, but for most trans people, the reality of transitioning and coming to terms with one's gender is not simply a matter of switching from one cultural script (e.g., cis lesbian) to another (e.g., heterosexual trans man). Instead, all of these histories and identities often coexist; the notion of a distinct uncoupling between the "pretransition" and "posttransition" self fails to recognize both the continuity and the piecemeal evolution of a person's gender transition. In this sense, many people will find themselves "performing" a gender that is the culmination of all of their lived experience—in all its complexity and oxymoronic beauty. Someone may be both a man and not-a-man or a proud trans woman who talks about her past self using "he/him" pronouns. These elements all come into play in a person's understanding and presentation of their gender, and they exist *beside* each other like pieces of a puzzle, rather than one above another in a perpetual game of inner archaeology. This theory can apply equally to cis people, as every individual has both resonant and conflicting elements of themselves, including their gender, sexuality, and family history.

One final factor in understanding performativity relates to recent critiques of the concept of "passing." Passing refers to the ability of some trans women and men to "pass" or be consistently seen as their affirmed gender. A trans man who has undergone phalloplasty, multiple years of hormone replacement therapy, and a double mastectomy may find that he is regarded as a man and does not encounter any resistance or questioning as to that fact in his everyday life. By contrast, many trans people cannot pass; they are regularly recognized as trans or seen as the sex they were assigned at birth. While passing, or striving to pass, is fundamentally a means of survival in a transphobic and cis-centric world, it is also the ultimate goal for many trans women and men. But QT flips this notion on its head by problematizing what it is that we are supposed to *pass as*. This brings us back to Butler, particularly her notion of gender performance being a copy of a copy without an original. If there is no original, then, as Mattilda Bernstein Sycamore states, "nobody passes." We are all aiming for (or going against) an entirely fictitious and immaterial ideal, whether we identify as trans or otherwise. This perspective aims to level the playing field by showing that the validity of concepts such as passing dissipates when we recognize that we all contribute to what gender was, is, and could be by simply existing in our uniquely gendered ways. And if nobody passes, then we are all gender failures.

Failure

Failure is a difficult word, one with almost entirely negative connotations. Failure is seen as an undesired or premature end, an incomplete mission, an unticked box. But in the same way that queer theory encourages us to rethink the notions of abjection and boundary defiance, it also provides a significant challenge to how we might consider the role of failure in the lives of trans people. To fail means that there is a standard that determines success, one that a person has fallen short of. In Western society, transness is often described as a failure: a failure to stick to the norms of your assigned sex, a failure to pass as a man or a woman posttransition, and, for those trans people who are also economically, socially, and/or medically disadvantaged, a failure to live up to capitalist expectations around labor and "good citizenship." It seems that, in many respects, failure is unavoidable for trans people.

However, this sense of inevitable societal and discursive failure for trans people has prompted the same process of reclamation that other words, including the term *queer* itself, have undergone. If society deems failure as wholesale negative, it may prompt one to question the validity of that standpoint. QT provides an alternative perspective on failure: Not only is failure queer and trans, but it is also good. A trans person becoming a failure by abandoning their assigned sex may be seen as a personal failing on their part, but in fact, this failure reveals the artifice behind gender as we understand it in many cultures.

If a system is perfect and all-encompassing, then it should never experience failure. And yet,

the collective perception of trans people is that they have failed to meet the standards required by this system. If there is an ever-growing population of people who do not measure up, then perhaps the system itself needs to be taken to task. More important, there is a need to look at the *joy* brought on by falling short of narrow gender parameters. QT suggests that failing to fall in line with such a restrictive and oppressive set of gendered scripts is ultimately a blessing. It is an opportunity to explore further than you were told you could go, even if it might be at the expense of some relationships and socially privileged roles that favor assimilation and strict systems of gender (and sexuality). Failure can be a gift, a potentially liberatory exit from the limitations of binaries, static identities, and walled-in classifications of lived gender experiences.

The Limits of Queer Theory

While it is valuable to consider the positive impact of QT on trans people, it is equally worthwhile to consider where QT's own limits lie. Most important, QT has largely come out of the United States, United Kingdom, and Australia, meaning that it has developed within very specific Western cultural contexts. While there is some ongoing affinity with, and reference to, other paradigms of gender, such as those in the global South and in various First Nations cultures, QT nonetheless bases much of its critiques within predominantly white, higher-income, Westernized countries. This is not to overlook the contributions to this body of knowledge by people outside of these national and cultural settings but to say that the dominant literary pillars of QT remain rooted in this privileged academic milieu.

There is also the need to consider some of the unintended consequences of grouping all trans people into a "queer" framework. Gávi Ansara (2010) has suggested that this creates a type of "coercive queering," wherein all trans people are absorbed into the greater notion of a "queer community" or "queer life" (p. 188). It is crucial to consider where that leaves those who, for whatever reason, do not feel aligned with queerness (e.g., heterosexual trans people, non-heterosexual trans people who may not describe themselves as "queer"). We also need to consider what it means to attempt to enclose trans experiences within a frame that is too confining for all trans people. Transness is not categorically queer, and QT does not always correctly negotiate gender or indeed negotiate gender at all. In this sense, it is vital to remember that QT is not an all-encompassing, broadly applicable system but rather an exploratory toolkit that helps comprehend some of the more tangled and complex questions around gender and those who challenge its norms.

Queering Femininities

Queering femininity involves expanding the definition of femininity beyond traditional iterations that emphasize particular Western societal norms and beauty standards. It also places an emphasis on decoupling femininity as a construct from sex assigned at birth and from gender identity—anyone of any assigned sex or gender may embrace a queered femininity. This has made queered femininity an important construct in relation to trans studies. This entry explores queering femininity by first defining traditional femininity, then considering the idea of femme over time, and finally by discussing the inherent intersectionality of queered femininity.

Traditional Femininity

To understand queer versions of femininity, it is important first to briefly examine more dominant cultural definitions of this femininity. Traditional femininity (sometimes also called normative or patriarchal femininity) is based on a fundamental biological essentialism for people assigned female at birth (AFAB). This type of femininity necessarily assumes the alignment of an individual's sex, gender identity, and sexual orientation—in other words, a feminine person must be an AFAB heterosexual woman. These assumptions form the basis of more culturally prescribed norms for femininity in Western societies, including a high value placed on being white, young, thin, able-bodied, and conventionally attractive according to beauty norms. In order to be perceived as feminine through this cultural lens, all of these conditions must be met. Furthermore, the function of traditional femininity is that it is performed for the benefit of men and for procuring a heterosexual male partner.

Femme

In contrast to traditional femininity, the idea of femme encompasses nonnormative femininity that does not align with the assumptions set forth by traditional femininity. Historically, *femme* first referred to feminine-presenting, lesbian-identified women who partnered with masculine-presenting "butch" women. Due to the dynamics of these relationships, this early construction of femme identity often centered on attraction to non-cis masculinity and emphasized the need for allyship to gender-nonconforming women, who were more likely to be targeted with more overt forms of discrimination and harassment. Additionally, this femme expression of femininity was considered nonnormative due to the femme women's nonheterosexual orientation and performance of femininity for themselves and other women, rather than for cis men. Thus, embracing this femme identity corresponded with a politicized resistance to traditional femininity that prescribed a particular heterosexual dynamic with men.

The concept of femme has since evolved to become more diverse and inclusive. Now, *femme* may refer to anyone who is perceived to have failed at, or who actively rejects, any of the traditional assumptions of femininity. Thus, femme within LGBTQIA+ communities is a label that is used by individuals with a range of identities, rather than just those who are lesbian identified or AFAB, or even who currently identify as a woman. *Femme,* in contemporary LGBTQIA+ communities, is an identity label and alternative expression of femininity that is embraced by individuals with a range of gender and sexual identities. There is an effort among femme-identified people to define femme vaguely and leave it up to individual interpretation in order to be as inclusive as possible. Additionally, the historical legacy of resistance in femme–butch lesbian communities has continued in this contemporary iteration of femme, in which there is an emphasis on both resistance to traditional notions of femininity and empowerment in alternative expressions of femininity. It is associated with both intentionality of expression and reclaiming aspects of femininity that feel identity congruent for the individual. Furthermore, as part of empowered resistance, many femme individuals

present with bold aesthetics in order to come across as more visibly queer.

It is important to note the ways in which femme identity manifests in contemporary LGBTQIA+ subgroups. As discussed above, feminine-presenting sexual minority (LGBQA+) women have historically faced less overt prejudice than masculine-presenting LGBQA+ women, due to presenting in a gender-conforming way. However, because of the conflation between gender nonconformity and sexual minority status, feminine-presenting women are often invisible as LGBQA+ individuals. This presents a different kind of stressor for femme LGBQA+ women, as they must regularly out themselves in order to have their sexual identities recognized and respected. This trend holds even within the LGBTQIA+ community, in which femme LGBQA+ women often have to reiterate and justify their sexual minority status. Otherwise, they are assumed to be heterosexual, resulting in an invisibility and even denial of an often salient aspect of their identities.

Femininity among trans individuals is also devalued within mainstream society, owing to the devaluation of both femininity and transness. Trans women, in particular, face prejudice because they both reject their assigned masculinity and express femininity, thus putting them at increased risk for discrimination and violence. For example, trans women make up the vast majority of trans individuals murdered each year. Additionally, in order to be accepted in society as women, trans women are expected to perform traditional femininity. If they perform too little femininity, they may be accused of not trying hard enough, and if they perform too much femininity, they may be accused of caricaturing women. Adopting a femme identity can help trans women to embrace femininity and reject the masculinity that was forced upon them. However, it is also worth noting that not all trans women want to embrace a queered femininity in this way. There are many trans women who welcome the invisibility associated with traditional femininity because it affords them the opportunity to live as women without disclosing their trans status (i.e., be "stealth").

Trans men and nonbinary individuals may also identify with a femme identity. Many transmasculine AFAB individuals strongly reject femininity after coming out as trans but then reclaim aspects of femininity further along in their transitions after they become more affirmed and settled into their identities. This later reclamation of femininity is necessarily queer because it does not follow the traditional script for femininity that necessitates a cis woman status. Trans men who express femininity are presenting in a gender-nonconforming way (i.e., a queer way). Similarly, nonbinary individuals, regardless of sex assigned at birth, have an inherently queer gender and thus an inherently queer expression of femininity. Furthermore, trans individuals often present in particularly bold ways to overtly signal their queer identities, further adding to the queering of their femininity.

Femmephobia

Femmephobia is defined as prejudice against people perceived to be feminine, especially prejudice against nonnormative femininity (i.e., femme individuals). Femmephobia differs from misogyny in that misogyny is defined as prejudice against women as a group, whereas femmephobia focuses on femininity itself. Femmephobia may thus include prejudice not only against cis women but also against feminine cis men and binary and nonbinary trans individuals. Additionally, because femmephobia often manifests as prejudice against individuals for being perceived as failing to embody traditional femininity, it also has an inherently intersectional focus, as these perceived failures are often the result of deviations from Western beauty standards that privilege individuals who are white, young, thin, able-bodied, cis, and heterosexual. Thus, other axes of marginalization are also brought to the forefront.

In addition to these broad considerations of femmephobia, it is also relevant to look at specific examples of how femmephobia manifests within subgroups of the LGBTQIA+ community. It is well documented that femininity tends to be devalued within communities of gay men. This is thought to be due to the privileging of masculinity within the dominant, patriarchal society and the assumption that gay men are inherently feminine for being gay. Within this context of societal heterosexism and femmephobia, many gay men have culturally valued masculinity and attempted to act more heterosexual and gender conforming in order to regain

sociopolitical privilege. Femmephobia among gay men is strengthened by society at large, as men who are more feminine face greater prejudice and discrimination, which, in turn, is linked to lower psychological well-being and lower self-esteem among feminine gay men relative to masculine gay men.

Intersectionality

Given the deliberately broad, inclusive definition of *femme* and the multiaxial marginalization of femmephobia outlined above, the concept of femme offers an inherently intersectional approach to femininity. Additionally, femininity as a concept is othered in society; thus, other identities that are similarly marginalized and devalued also become feminized. This allows for other minoritized identities to complement femme as a way of queering femininity, in contrast to traditional prescriptions of femininity. Femme identity has been an avenue of empowerment through which individuals who adopt this queer version of femininity are able to take back femininity from its heterosexual and otherwise dominant societal construction. In general, femme individuals have not only reclaimed and politicized traditional feminine expressions of fashion and makeup but also have created a space for those left out of traditional ideas of femininity (e.g., people who are of color, fat, old, disabled). This celebration of different types of femininity is inherently radical and queer because patriarchal society pits individuals against each other to best suit the ideals of traditional femininity. In contrast, femme identity embraces diverse expressions of femininity and does not require other forms of femininity to be disparaged and disregarded in order for it to be valued.

Femmes of color face challenges related to expressing femininity in the context of racism. Femmes of color can reclaim fashion and other feminine expressions based on their heritage, rather than adhering to the white prescriptions of femininity seen in mainstream society. This serves as both an act of resistance to traditional femininity and a means of empowerment through which femmes of color can become more attuned with their cultural backgrounds. Additionally, the experiences of femmes of color provide an example of how even within femme communities, there is not a universal understanding of queer femininity. For example, one fashion trend among young white queer women has been to embrace a vintage, 1950s aesthetic, which signifies a time period before rampant consumerism and, for some, a reclaiming of working-class roots. For some women of color, however, this fixation on 1950s fashion as an ideal is problematic, as it minimizes the racist social policies and practices of that era. This shows that, even within femme communities, what feels empowering for some may be disempowering for others, and some expressions may perpetuate harmful ideas.

Femmes of color also face a paradox of being both invisible and hypervisible for not fulfilling the traditional feminine role. They share this paradox with fat femmes, along with the subsequent societal message that they should take up less space on the basis of their hypervisible statuses as nonwhite and fat. Through reclaiming femininity, both groups also send a similar message that they refuse to be policed into taking up less room.

Traditional femininity prescribes that individuals must be thin, thereby inherently queering fat femininity. To embrace femininity while being fat is considered a taboo in mainstream society, which lends itself to a queer femme status. This idea is most evident for women and AFAB individuals, but it holds for people of all genders; the genders of fat people can be considered inherently queered because normative genders (i.e., cis men and cis women) are prescribed as inherently thin.

Similarly, the requirement of traditional femininity that one must be young means that aging is also an inherently queer (i.e., nonnormative) aspect of femininity. Under dominant societal norms, aging women are expected to fade into the background and relinquish their femininity; thus, to embrace femininity while aging is inherently queer and lends itself to a femme conceptualization of femininity and to a femme identity. Continuing to wear fashions prescribed for younger individuals and deciding how much or what types of makeup to use become queer acts of resistance to traditional femininity.

Disabled femmes likewise demonstrate inherent queerness by embracing their femininity due to the traditional feminine prescription that to be feminine, one must be able-bodied. Physically and mentally disabled individuals are often stereotyped

as nonsexual and thought of as sexually nondesirable, which means that disabled femmes need to reclaim their sexuality along with their femininity. Femmes with visible physical disabilities often strategically use fashion and makeup in order to acknowledge both their femininity and their disability.

R

Racialized Femininities

The modern binary gender system is a historical product of colonialism, moderated and informed by whiteness. Therefore, people who are *outside* of modernity and coloniality experience gender differently than white people. Black and brown people's genders are also marked and perceived differently than white binary genders because of the effects of racial stereotypes. *Racialized femininities* refers to the various manifestations and perceptions of femininity embodied by Black and brown people; the term takes into account how gender intersects with racism and colonialism. An examination of the racialization of femininities reveals how "true" femininity is defined by whiteness and how racism and colonialism rob or impose femininity on people of color to dominate and control them.

Colonial Gender Systems

Scholars in Indigenous Studies have illustrated how gender as a modern construct was socially constructed by coloniality. María Lugones outlines how coloniality naturalized the gender binary and therefore naturalized sexual differences between men and women. Binary and hierarchical gender ("man versus woman") did not operate as a concept for many precolonial societies. Rather, European colonial forces imposed the cis-heteropatriarchal binary gender system as a tool of domination in order to destroy Indigenous belief systems. For example, Oyèrónkẹ́ Oyěwùmí argues that in precolonial Yoruba society, power was not determined by gender because different genders were not binarily opposed; rather, the binary gender system was introduced through the violence of colonialism.

Postcolonial Studies has also revealed how colonial discourse described colonized women as exotic and orientalized in relation to white women's virginal innocence. For example, Gayatri Spivak unveils how canonical European novels like *Jane Eyre* capitalize on the contrast between the savage, mad, and hypersexual colonized woman of color and the pure white woman. While many colonized men were also portrayed as savage and barbaric in colonial discourse, they were simultaneously feminized to show their "failed" masculinity. Moreover, many representations of African and Asian geography in European literature feminize the colonized land, exposing the Western premise that "masculine" colonial forces should plunder and control "feminized" land. These historical impacts of colonialism continue today, as neocolonial and imperialist forces continue to use gendered militarism and orientalism to justify Western and white dominance.

Ungendering Under Enslavement

Scholars in Black Studies and Decolonial Studies have outlined how the modern understanding of humanness is based in Western and colonial knowledge production. They have also outlined how Black people were cast outside of the category of human and rendered less than human or nonhuman

under coloniality and enslavement by forcibly being transformed into commodities or rendered beastly in the Western imagination. Sylvia Wynter argues that the notion of the Western Human is rooted in a cisgender, heterosexual man. Frantz Fanon also argues that Black people were forced into the "zone of nonbeing," since the white colonial gaze rendered them less than human. Since binarily opposed genders are a requirement of the human, to be excluded from humanness also means an exclusion from the binary gender system. Therefore, those rendered nonhuman under enslavement were also forced out of colonial gender norms.

Hortense Spillers delineates how Black people were "ungendered" during slavery because of their violent transformation by the white gaze into commodities. Since Black people were "thingified," or turned into "things," all the traits that came along with the notion of the human, such as gender and kinship, were stolen from them. According to Spillers, the captive female body was unnamed and ungendered because it existed without the potential for family roles and kinship bonds. Distinguishing between the sentient "body" and the contained "flesh," Spillers shows that the body is the privilege of the free, while flesh is all that remained for Black people who were "thingified" by white enslavers. Since flesh is nameless and, therefore, ungendered materiality, it becomes a tool to racialize Black people. Flesh emerges when the idea of the full breathing body is stolen from Black people. Therefore, the concept of womanhood or femininity was denied to Black women because the white colonial gaze perceived them as flesh.

This concept of the ungendering of Black people under enslavement has been used in Black Trans Studies to examine what Marquis Bey calls the *Blackness of transness* and the *transness of Blackness*. C. Riley Snorton argues that "Black" and "trans" are not distinctly separate categories. Since both Blackness and transness are excluded from the Western binarily gendered human, these categories constitute each other. Snorton shows that the fungibility of Black flesh under enslavement created conditions of gender manipulation and rearrangement, hence giving birth to different forms of trans experiences. Black women who were ungendered or rendered flesh, therefore, occupied a trans space. Since Black and trans identities are interrelated and co-constitutive, Black feminism and trans feminism are also interrelated. According to Kai M. Green and Marquis Bey, Black feminism offers a trans feminist perspective because it challenges the limitations of the (white) gender binary and ruptures the category of "womanhood," exposing how "true" womanhood and femininity are available only to white cis women.

Racial-Gender Stereotypes

Since we live in an anti-Black global system that operates through a colonial framework, the white gaze conceptualizes the genders of women and femmes of color as excessive, failed, exotic, or underdeveloped. Racialized people are often perceived by the white gaze as monstrous; this monstrosity is particularly attached to women and femmes of color who refuse to embody the ideals of white womanhood. For example, Black and brown Muslim women who wear attire that white society deems abnormal, such as hijabs or burqas, are often considered monstrous or dangerous. Furthermore, Black women in general are often stereotyped as angry, loud, and excessive and thus rendered monstrous by the white colonial gaze.

Different women of color are also sexualized differently on the basis of race. Black and Latina women are often perceived as hypersexual or sexually excessive. This leads to a larger perception of a lack of Black innocence, due to which Black girls are often robbed of their girlhood because white society prematurely renders them grown sexual women. The white cultural perception of Latina women as exotic and oriental is also revealed in many contemporary cultural productions that fetishize Latina women as simultaneously othered and desirable. In contrast, Asian women are considered undersexual or passively sexual, and they are therefore infantilized. Arab and South Asian Muslim women are also perceived as undersexual or sexually repressed, based on stereotypes of Islam. The violent stereotyping of Black women as hypersexual results in a colonial need to police, control, and regulate Black feminine bodies, while the harmful stereotyping of brown Muslim women as undersexual results in a white savior complex, or an effort to "save" these women from their so-called repressive cultures.

Racialized femininities are not only produced through negative stereotypes but are also co-opted

and tokenized by imperialism. Erica Edwards argues that the binary of normativity and antinormativity is inadequate to understand the paradoxical position of Black women's sex and sexuality in the post–World War II U.S. nationalist and imperialist imaginary. Edwards argues that in the contemporary moment, Black sexuality is not only made monstrous, but it is also incorporated into the U.S. imperial imaginary. The co-optation of Black women by the United States often perpetuates imperialist feminism and homonationalism, which refers to the state's appropriation of liberal gender and sexual politics solely for the purpose of justifying the "War on Terror" and other neocolonial missions.

Coercively Assigned Femininities

While ungendering and commodification have historically robbed Black women of femininity, coloniality has often imposed femininity on Asian men. Discussing the "racial castration" of Asian cis men, David Eng contends that under the white gaze, the Asian American penis is rendered invisible. Because the Asian man is racially castrated and feminized, he is also queered, hence perpetuating the notion that colonized societies are queer, while white Western societies are heterosexual. Eng ties the feminization of Asian American men to migration and economic histories, showing how many Asian men traditionally worked in professions that were stereotypically perceived as feminine, such as laundries and tailors' shops. Furthermore, Chinese exclusion laws that prohibited the migration of Chinese women to the United States also contributed to the stereotype that Asian communities were homosocial queer communities, where men could substitute for women. Therefore, Asian American men were excluded from heterosexual reproduction and normative kinship bonds.

Since masculinity is normatively understood to be dominant and violent, and femininity is conceptualized as weak and passive, the perception of Asian men as passive feminizes them. Scholars in queer Asian studies, such as Nguyen Tan Hoang, contend that since Asian men are feminized, they are believed to be "forever bottoming" during gay sex, an idea that is based on the premise that bottoming equals passivity, and passivity means feminine. Hence, sexuality is always intertwined with racialized gender. In such instances, there is a clear link between oriental passivity, racial castration, and sexual bottoming.

Oriental fantasies and fears of brown femininity also extend to brown Muslim or Sikh men, who are likewise considered a failure of masculinity. Jasbir Puar demonstrates how the "War on Terror" produced the notion of the feminized brown man. Puar discusses how the image of the feminized, turbaned man was created in order to justify the anal raping of imprisoned cis men in Abu Ghraib. For example, after 9/11, feminized and sexualized images of Osama bin Laden were frequently circulated to demonize racialized Muslims and transform them into the sexual "bottom" during acts of military rape. The "War on Terror" constructed Muslim and immigrant communities as sexually repressive and exceptionally homophobic, as well as created the perception of the Muslim/terrorist body as a demonic kind of queer by representing it through perverse femininity. While perverse queerness has historically been associated with many communities of color, contemporary imperialism also portrays the West as liberal and gay-affirming, hence demonizing communities of color as homophobic to produce and perpetuate homonationalism. Homonationalism espouses the false narrative that the United States promotes the "right" kind of queerness by abiding by Western notions of masculinity and femininity, while racialized Muslims stand outside the "right" kind of queer identity because of their presumed perverse femininity and pathologically homosocial culture.

Take-Aways

Since Black and brown women and femmes are differently located from white women, racialized femininities should be examined through the power structures of the modern-colonial gender system. The white colonial gaze dictates that "true" femininity must correspond to the qualities embodied by white cis women, and "true" masculinity must correspond to the qualities embodied by white cis men. Therefore, Black and brown women and femmes are often perceived by the white gaze as inadequately feminine for being outside of the white binary gender system. Black women and femmes are perceived as masculine by the white gaze and ungendered in the afterlife of slavery because of the forced "thingification" of

Blackness. At the same time, Asian, Arab, and brown Muslim men and masculine people are often forcibly rendered feminine by colonialism. Therefore, different markers of gendered excess or lack thereof are attached to people based on the complex and, at times, contradictory ways in which they are racialized.

Racialized Masculinities

The term *racialized masculinities* describes the intersection of masculinity and race. The phrase is often used by scholars and others to describe the behaviors, styles, and identities of cisgender men of color. Yet, trans masculinities taken on by a broader range of individuals who are not cis men are also racialized. A critical examination of whiteness indicates that white masculinities are racialized masculinities as well. Resources and privilege that often accrue to masculinity in a heteropatriarchal culture play out differently according to race, as well as class, sexuality, and ability. Differential experiences of safety in public spaces and material outcomes in the workplace illustrate how Black and Latinx trans masculinities, as well as other trans masculinities of color, do not necessarily confer the same advantages of white trans masculinity. This entry uses the concept of intersectionality to define and provide examples of racialized trans masculinities, mostly in the United States, and illustrates how these masculinities differently shape experiences of privilege and safety for transmasculine people.

Defining Racialized Masculinities

The phrase *racialized masculinities* refers to a specific, interconnected relationship between socially constructed categories of masculinity and race. Masculinities are practices and styles that are associated with men in a given time and place. Referring to masculinities, instead of a singular masculinity, is a reminder that there are multiple ways to express masculinity and a range of categories of masculinity. It would be easy to think that everything men do is masculinity, but people who are not men or who are not assigned male at birth can be masculine, and femininity is not the sole arena of women. Race is a social construct and

system of dominations in which laws, policies, and social practices assign people into groups by a combination of physical characteristics and geographic origins. Race refers to, but is not reducible to, those bodily features or places. Racism has very real effects, but race itself is a culturally and historically constructed category that varies over time and place. In critical masculinity studies, the masculinities associated with working-class Black and Latinx men are often defined as protest masculinities in relation to dominant or hegemonic masculinities that are associated with whiteness and middle- or upper-class status.

Intersectionality and Racialized Masculinities

Masculinity and race intersect at individual, group, and systemic levels. The concept of intersectionality, a phrase coined by critical legal scholar and Black feminist Kimberlé Crenshaw and an idea that largely comes out of Black feminist theorizing and activism, illustrates that gender, race, sexuality, class, and other aspects of difference are not separate from one another but interconnected. At the individual and group level, intersectionality does not just describe the experiences of people of color but how all people simultaneously experience various aspects of their social positions and how those positions affect and shape one another. Most important, the lens of intersectionality elucidates how race, sexuality, gender, and class are imbued in social structures and institutions as interlocking systems.

Different aspects of gender also intersect with one another. At the intersection of transgender and masculinity, trans masculinities encompass a range of identities and social positions that most often refer to people who were assigned "female" at birth and who identify with or perform masculinities. This category includes trans men, a range of nonbinary genders, and people who identify as women and engage in styles, dress, and ways of moving that reference masculinities. The most expansive definition of trans masculinities encompasses identities like butch, drag king, and tomboy, although not all of these individuals would consider themselves trans. In this instance, the term attempts to capture a range of identities that cross normative expectations for gender through engaging with masculinities. Earlier understandings of these ways of being referred to them as *female masculinities,* although the term has since fallen out of popularity. *Transmasculine* is often used as a shorthand for describing trans people who are assigned female at birth, whereas *transfeminine* is a shorthand for trans people who are assigned male at birth. Yet, trans women who identify as butch, as well as female-assigned nonbinary people who reject masculinity, do not fit neatly into those categories.

Racialized Trans Masculinities

Using the broadest definition of trans masculinity, there are a number of trans masculinities linked to people of color. *Masculine of center* (MOC), popularized by B. Cole of the Brown Boi Project, is meant to be an inclusive term for transmasculine people to describe themselves. In its original conception, MOC is also meant to signal a desire to engage in political coalition with others and to work toward societal transformation of gender, race, class, sexual, and other inequitable inter- and intragroup relations. *Stud* and *aggressive* are masculine identities taken on primarily by Black individuals who were assigned female at birth and who adopt styles of clothing, ways of speaking, and other characteristics of working-class Black masculinities associated with street cultures and rap music. Like other racialized masculinities, the toughness of stud and aggressive styles can act as a way to navigate the violence of white supremacy, as they do for cis Black men. This toughness can also protect Black transmasculine people from homophobia and transphobia in Black communities. These tough presentations also, at times, translate into relationships that mirror some of the misogyny of heteronormative intimate dynamics.

The relative raced, gendered, and classed locations specific to other racialized masculinities, such as Asian American and Latinx masculinities, also shape the trans masculinities of people in those racial or ethnic groups. Native North American or other Indigenous trans masculinities might be captured in the term *two-spirit*. There are also a variety of non-Western trans masculinities, such as the Indonesian *tomboi* or Thai *tom.* Indigenous and non-Western categories might resemble trans masculinities that are more familiar in the U.S. context, but they originate within their cultural ways of understanding gender overall and are not necessarily reducible to

one another. Naming white masculinities as racialized masculinities offers an opportunity to understand how racialization affects white transmasculine individuals and groups rather than only how racialization affects people of color.

Masculinities in general and each of these racialized trans masculinities hold specific meanings in the geographic context and particular local communities where they circulate. Whiteness often operates as an unmarked category in white supremacist or white-dominated societies. Whether white, Black, or another racialized group, racialized trans masculinities are also shaped by socioeconomic class, sexuality, ability, and other aspects of difference. These racialized masculinities do not determine the masculinity of an individual but represent the cultural and social meanings that they contend with in their everyday lives and over the course of their life in larger cultural contexts. They are not just styles or neutral groupings, because the intersection of race and masculinity produces actual effects on people's lives.

Effects of Racialized Masculinities

Masculinity is often associated with a variety of social and material privileges in patriarchal and heteronormative societal contexts, but race affects this relationship to privilege. Transmasculine people who are recognized as men by other people often experience a range of social and material benefits associated with men as a group. These moments of privilege include things like being listened to and seen as more competent by others, as well as being given more physical space in everyday interactions than cis women and transfeminine people typically receive. Masculinity is also often valued within trans and queer communities where transmasculine people frequently hold more positions of power or receive more visibility within some communities or social and political organizations. It is important to note that although masculinity may confer some advantages, especially for individuals who appear to be heterosexual and white, gaining privilege in not usually a motivation for transition or adopting a transmasculine identity. Consider the intersection of race and gender: Being recognized as a particularly racialized man or being racialized as transmasculine in a specific way may lead to more negative consequences. Differences in safe access to public space and workplace experiences exemplify the varying privileges and subjugations connected to racialized trans masculinities.

Raced and gendered experiences in the workplace, as a context where people earn their living, illustrate the potential material effects of the complex relationships to privilege for differently racialized transmasculine people. A new sense of being seen as competent at work upon gender transition means that trans men or other transmasculine people may be more likely to be promoted and seen as potential leaders by managers and coworkers. Yet, these benefits may accrue only to white transmasculine people, especially those who perform normative masculinities and appear to be able-bodied and heterosexual. Black or Latinx transmasculine people face a different set of racial stereotypes and structural conditions of racism than do Black and Latinx cis women or transfeminine people, and those workplace conditions are damaging in different ways. For example, a Black trans man who works as a nurse might be seen as less competent due to stereotypes and cultural images of Black men as violent, whereas a white trans man is more likely to be promoted as a leader in this feminized profession. Coworkers and managers might view Asian or Asian American transmasculine people through stereotypes about intelligence and passivity, where they are perhaps seen as an efficient worker but not suitable for leadership.

Racialized Masculinities and Public Space

Differing experiences in public space further illustrate the effects of racialized masculinities on transmasculine people. Transmasculine people who were assigned female at birth might have been socialized in their early lives by families, schools, and through broader cultural messages that they were not safe walking alone in public spaces at night due to the gendered threat of sexual assault. Upon being recognized as men or masculine, trans men or other transmasculine people may find that they no longer fear being sexually assaulted in public spaces, which allows a sense of freedom, although they themselves may now become an object of fear by women who are working to protect themselves from assault. The threat of gender or sexual violence may span across white-dominated spaces and communities of color for transmasculine people

whose gender appears to others as visibly nonconforming, ambiguous, nonbinary, or queer. The effects of hatred or exclusion on trans people of color might be particularly impactful within communities of color because those communities are often necessary for support and survival in a white supremacist society.

For Black men or transmasculine people in particular and, to a lesser extent, non-Black Latinx transmasculine people, access to public space is often curtailed by the threat of police and state violence. White transmasculine people may find that an individual woman on the street is wary of them. Yet, the gendered and racialized cultural image of Black men as inherently threatening, and both hype violent and hypersexual, means that they are more likely to be seen as a physical and sexual threat, especially to white women. Based on this imagined threat, people are more likely to call the police on Black transmasculine people and police are more likely to stop them in public places. In a similar vein, transmasculine people who appear to be of Middle Eastern origin or who wear clothing associated with Islam may also be perceived as threatening and a terrorist. Regardless of the actual behavior of some racialized masculine people, their presence in public space becomes threatening due to cultural ideas about race, masculinity, and danger. Treatment by agents of the state, such as police, immigration, or other security officers, as well as court officials and policymakers, may lead to experiences of violence and less access to public space for some racialized groups of cis and trans men and masculine people. To fully understand racialized trans masculinities means acknowledging the different social and material consequences at the intersection of gender and race.

Reality TV

Reality TV is a form of entertainment television that focuses on unscripted interactions and ordinary people rather than actors or professional media personalities. At the turn of the 21st century, reality TV began to emerge as a popular television genre, and over the next two decades, it became a mainstay of television broadcasting in the Western world. During this time, there were significant shifts in the amount and types of representations of trans people in screen media, and reality TV was one of the key sites of these changes. Reality TV has proven a valuable and distinctive platform for mainstream representations of trans people. More than light entertainment, over the last two decades, reality TV has directly contributed to trans politics and debates.

It is the nature of reality TV that its participants are presented as ordinary but at the same time also “special” for having been singled out and made the focus of a television show. In keeping with this motif, trans people featured in reality TV tend to be presented as ordinary, and therefore

knowable, while also standing out as individuals and being celebrated as such. In its most positive capacity, reality TV has increased the general public's familiarity with trans people and particular trans experiences, working to normalize certain trans identities and create greater acceptance of them. In many cases, it has also directed attention to the real-world discrimination and transphobia trans people face. Yet while some reality TV representations of trans people have been affirmative, educational, and/or celebratory, others are exploitative and even transphobic.

As with many mainstream media representations of trans people, in reality TV, there has been a much greater focus on trans women than on trans men. Furthermore, of those trans people who have appeared in reality TV, there has been a disproportionate representation of white, able-bodied, and middle-class people, and reality TV also tends to privilege transnormative modes of trans identity. Within these representations, there is often the problematic underlying theme that trans people have a responsibility to use the platform to educate cis people about trans lives and politics.

Since the turn of the century, reality TV has acted as something of a gauge for the shifting position of trans people in the social consciousness. This entry follows the broad history of trans representation in reality TV since the beginning of this century, focusing on competition shows and docusoaps, which are the two subgenres of reality TV that have most significantly included trans people.

Early Trans Representation in Reality TV

One of the first reality TV competition shows to substantially include a trans person was the U.K.-produced *There's Something About Miriam,* which starred Mexican trans model Miriam Rivera. *There's Something About Miriam* was set in Ibiza and ran for one season in 2004. It was relatively popular with mainstream audiences and aired in a number of countries, including the United Kingdom, United States, Australia, Poland, and Argentina. Following the formula of dating reality TV franchises such as *The Bachelor,* its focus was six cis men vying for Rivera's romantic affection and a £10,000 prize; the twist, however, was that the contestants did not know Rivera was a trans woman. This fact was revealed to them as a "shock" revelation in the season finale once the winner had been announced. All the advertising for *There's Something About Miriam* emphasized Rivera's being trans as a "secret," and each episode underscored and sensationalized that Rivera was a trans woman who had a penis. For example, the show would often, problematically, make a point of identifying Rivera as a "preoperative" trans woman. It also took advantage of Rivera being a voluptuous and stereotypically attractive woman, with the camera often concentrating on her breasts and buttocks.

Although many reality TV shows have since included trans people in more positive and progressive ways, *There's Something About Miriam* relied on regressive modes of representation that portrayed trans people as duplicitous, which were common in 20th-century screen media. *There's Something About Miriam* evoked transmisogyny and transphobia in the ways it positioned Rivera as deceptive and implied the main purpose of her femininity was to entice and "trick" the cis male contestants, rather than it being an expression of her authentic gender identity. When it was revealed in the finale episode that Rivera was trans, the cis man who won the competition became the butt of transphobic jokes. Furthermore, after it was broadcast, the contestants sued the show's producers for defamation, breach of contract, personal injury, and conspiracy to commit sexual assault.

A number of commentators and critics have condemned the show for its representation and dissemination of transphobia. *There's Something About Miriam* was a mainstream media product that centered on a trans person and depicted her as charming, warm, and attractive, which in some ways worked to validate trans subjectivities. However, ultimately it exploited Rivera's physicality and erroneously aligned her being trans with deception, undermining the legitimacy of her gender identity. Nevertheless, the positioning of trans people in reality TV would change from this point onward. Indeed, such was the shift over the following years that in 2008, the United States offered something of an antidote to *There's Something About Miriam* with *Transamerican Love Story*. Working to a similar reality TV dating formula, *Transamerican Love Story* featured a group of cis men contestants competing for the

romantic attention of trans woman Calpernia Addams. Unlike *There's Something About Miriam,* however, all the contestants knew from the outset that Addams was a trans woman, and the show was praised for not sensationalizing Addams being trans.

Big Brother Franchise

In the early years of the new century, *Big Brother* became a reality TV phenomenon, one that, over many years and across many countries, has amassed a relatively significant cohort of trans contestants. Originally airing in the Netherlands in 1999, *Big Brother* was soon syndicated in a range of countries across the world. Each season features a group of contestants, or "housemates," locked together in a house under extensive video surveillance. They are systematically eliminated by public vote until the final remaining contestant emerges as the winner. Trans contestants have featured in *Big Brother* in the United Kingdom, United States, Australia, Netherlands, Brazil, Spain, Sweden, Philippines, and Italy. The international appeal of trans contestants indicates their particular aptitude for fulfilling the formula of being a successful reality TV contestant, which is that contestants are seen as both special and ordinary. On *Big Brother,* trans contestants are usually identified as being distinctive and special for being trans but at the same time rendered ordinary via reality TV's imperative of "ordinariness."

The particular format of *Big Brother* means it has been especially productive in presenting trans reality TV contestants as ordinary. Like all *Big Brother* housemates, trans housemates appear in a domestic space performing everyday activities (e.g., sleeping, chatting, cleaning) over an extended period. These mainstream television depictions of trans people in everyday scenarios are noteworthy because of the media history of trans people being presented as deceitful, as theatrical spectacles, or exploited on tabloid talk shows. In contrast, in many ways, *Big Brother* has often depicted trans people as real, complex people with whom mainstream audiences can become familiar. Nevertheless, while *Big Brother* has often provided affirmative inclusions of trans contestants, trans contestants on *Big Brother* have also dealt with transmisogyny and transphobia.

Big Brother (U.K.)

Big Brother (U.K.) stands out for its relatively high inclusion of trans contestants. A notable early and formative example of *Big Brother*'s ability to offer audiences familiarity with a trans person while establishing them as a celebrity came in 2004 when Portuguese trans woman Nadia Almada won *Big Brother*. Almada's presence on *Big Brother* and her popularity as a reality TV contestant functioned as counterpoint to *There's Something About Miriam*'s exploitative mode of trans representation and marked a turning a point in how trans people were included in reality TV. The voting audience of *Big Brother* Series 5 chose boisterous but endearing contestant Almada as the winner (with 74% of the final vote), after which she maintained her fame and became the most prominent trans person in the United Kingdom. During her time on the show, *Big Brother* producers and the viewing public knew that Almada was trans; however, she chose not to tell her fellow housemates, and they assumed her to be cis. Almada expertly fulfilled the reality TV formula for success; she was interesting and distinctive because of her social transition, and at the same time, cis audiences came to be comfortable with her because, among other things, she appeared over months in the domestic space of the *Big Brother* house. This circumstance gave mainstream U.K. audiences the unusual opportunity to become familiar with a trans woman from a place of knowingness while also watching her function as a cis woman. Almada was generally deemed an authentic reality TV contestant and avoided being perceived as deceptive because she was able to convey—largely through confessionals in the *Big Brother* "diary room"—that her authentic identity was that of a woman; not identifying herself as trans to her housemates actually gave her a chance to be treated as such.

Nevertheless, Almada's presence in the show was certainly not dealt with in an entirely affirmative manner. First, the show maintained a focus on the fact Almada was a trans woman and often used it to create tension. Furthermore, outside of the house, the U.K. press made many transphobic jokes about Almada's appearance. After her *Big Brother* victory, Almada remained a popular celebrity for a number of years and returned to *Big Brother* as a contestant on *Ultimate Big Brother* in

2010. However, audiences turned against Almada while she was in the house. In the days following her subsequent eviction, Almada received hate mail and transphobic abuse on the street, and in less than a week of her eviction, she attempted suicide, all of which was widely publicized. Her participation in *Ultimate Big Brother* and its aftermath demonstrated how close to the surface transphobia can be and how fragile acceptance can be for trans women, including those who are celebrities.

After Almada's negative experience, *Big Brother* (U.K.) went on to include popular and unpopular trans contestants. In doing so, it significantly contributed to the increasing presence of trans people in mainstream media at the time. For example, in 2012, trans man Luke Anderson won the 13th season of *Big Brother;* in 2013, trans woman Lauren Harries came in third on *Celebrity Big Brother;* and in 2018, *Celebrity Big Brother* included the United Kingdom's first trans television newsreader India Willoughby, who was the first housemate on the show to be evicted. These inclusions again enabled cis audiences to engage with trans people and their lives in often, but not always, productive ways beyond shock headlines. Notably, for example, in 2014, trans woman Kellie Maloney entered the *Celebrity Big Brother* house. Maloney had been a successful boxing manager before retiring in 2013, and her appearance on *Celebrity Big Brother* came at the beginning of her social transition. The U.K. press had emphasized the apparent "jarring" effect of a "tough-talking" boxing manager disclosing she was a woman, but during her time on *Big Brother,* Maloney shared and humanized her experiences.

U.S. Competition Shows

A range of competition reality TV shows, such as the international *Idol* and *Got Talent* franchises, have occasionally included trans contestants, who have experienced varying degrees of success and fame as a result of these appearances. As in most Western countries, trans reality TV contestants in the United States have tended to appear as a "special" type of contestant, with shows playing up the fact they are trans to mark them as distinct and interesting but often also having the effect of bringing trans-related issues into public consciousness. For example, in 2008, *America's Next Top Model* (*ANTM*) included trans woman Isis King. Each season, *ANTM* follows a group of aspiring fashion models compete for an elite modeling contract. When King first appeared on the show, her inclusion was widely viewed as a step toward the acceptance of trans women; however, the show gave exaggerated focus to her having a penis. Moreover, the show depicted other contestants making transphobic comments about King, which were widely condemned, including by the creator and host of *ANTM,* supermodel Tyra Banks. King was eliminated in Episode 5 but was a popular contestant and returned in 2011 for *ANTM All Stars*. In this season, a problematic emphasis was again given to her genitals, this time in relation to her having undergone gender confirmation surgery. She was also shown to again face transphobic comments from fellow contestants. King was eliminated in the third episode but has maintained celebrity status since, including as the star of a reality docusoap series (discussed in the following section).

In the same year that Maloney appeared on *Celebrity Big Brother* in the United Kingdom, *Time* magazine in the United States declared that the "transgender tipping point" had arrived. In response to increasing trans visibility in mainstream media, in its 17th season, *Big Brother* in the United States included its first trans contestant in 2015. Indeed, just weeks after *Vanity Fair* magazine famously featured Caitlyn Jenner, trans woman Audrey Middleton entered the *Big Brother* house. The press sensationalized Middleton being trans to some extent during the lead-up to the season starting but also likened Middleton to Jenner, including Jenner's role as an advocate for trans people. Middleton disclosed that she was trans to her fellow housemates on the first night of the competition and was met with a resoundingly affirmative response. She quickly became unpopular with her housemates, however, because of her competition strategies, and she was the fourth evictee of the season, with all but one of her housemates voting for her to leave. After her eviction, Middleton asserted that she saw her presence on the show as having contributed to the visibility and acceptance of trans people.

RuPaul's Drag Race (*RPDR*) has also proven a reality TV space in which issues of transphobia have been brought to the fore. Starting in 2009, each season of *RPDR* features a group of drag

performers competing to become "America's next drag superstar." The show is, in part, a queer parody of *ANTM*. *RPDR* has become a hit queer-themed show around the world and has inspired a number of spinoffs. Despite *RPDR*'s close affiliation with the queer community, it does not have a reputation for easily including trans people, largely due to controversial comments made by the show's creator and host RuPaul. RPDR thus brings to light certain tensions within the LGBTQIA+ community. Most contestants on *RPDR* are gay men, but trans contestants have become a larger part of the show as the seasons have progressed. In Season 2, Sonique was the show's first openly trans contestant, disclosing that she was trans in her season's reunion special. In Season 5, Monica Beverly Hillz apparently surprised those on the show when she disclosed that she was trans. Her fellow contestants and RuPaul appeared supportive and accepting of her announcement.

It was not until Season 9 of *RPDR* that an out trans woman was a competitor in the show from the beginning of a season. Season 9 was widely identified as a hallmark for the show and the trans community when trans woman Peppermint was a successful contestant, ultimately becoming the final runner-up. Although her gender identity was acknowledged, it was not a point of contention or drama. *RPDR* has affirmed its place as an important contributor to cultural discourse regarding gender, as a number of the show's alumni have announced they are trans, genderfluid, and/or genderqueer after their season has concluded and have received press attention for these announcements precisely because of the fame they acquired from being on the show. Notably, since being on the show, Carmen Carrera, Kenya Michaels, Stacy Layne Matthews, Jiggly Caliente, and Gia Gunn have all publicly disclosed they are trans women, and Courtney Act, Violet Chachki, Jinkx Monsoon, Valentina, Aja, Adore Delano, Honey Mahogany, Sasha Velour, Gigi Goode, and Bob The Drag Queen have all publicly identified as trans, genderfluid, or genderqueer.

Docusoaps

Docusoaps are a documentary-style subgenre of reality TV that has become a locus for trans representation in television. Docusoaps combine documentary aesthetics with the drama and serial format of soap opera. Docusoaps follow their subjects over the course of a series and, as such, are distinct from reality programming that features trans people as one-episode participants, such as makeover and medical reality shows. When makeover and medical reality shows include a trans person in an episode, they tend to focus on aspects of the person's physical transition and on bringing the trans person's physical appearance into line with expectations of binary gendering. A notable exception to makeover reality TV shows that only include trans people in one-off episodes is *TRANSform Me* (2010), a U.S. makeover show that was produced by and starred trans celebrity Laverne Cox, in which cis women received a makeover from three trans women stylists. This show has been critiqued for its emphasis of heteronormative ideals of feminine beauty but also applauded because it was the first show to be produced by, and star, an African American trans woman.

Like all reality TV, docusoaps present their subjects as "authentic" and "ordinary," knowable and familiar, despite the shows being heavily managed and edited. When docusoaps are about trans people, this sense of authenticity and ordinariness can be impactful, as they can offer mainstream viewership sustained engagement with trans people being presented as authentic, not deceptive, ordinary, and not sensationalized. There were precedents for contemporary docusoaps that focus on trans lives, from the United Kingdom's *Change of Sex* in 1979 to *Paddington Green* (1998–2000), in which trans sex worker Jackie McAuliffe was among the selection of "ordinary" British citizens the series followed. With the growing interest in trans lives after the turn of the century, a selection of one-off series was produced in the United Kingdom and the United States, including *My Dad Diane* (2005), *Lucy: Teenage Transsexual* (2007), *My Transsexual Summer* (2011), *Transsexual Teen: Beauty Queen* (2012), *TransGeneration* (2005), *Trantasia: Every Boy Has a Dream* (2007), and *Becoming Us* (2015).

A noteworthy selection of docusoaps also has capitalized on the existing fame of certain trans people. For example, Canadian docusoap *Brave New Girls* (2014) featured trans woman Jenna Talackova, who had gained fame in 2012 for legal action she took to be allowed to compete in Miss Universe Canada. *Brave New Girls* features Talackova and her two closest friends. It follows

Talackova as she moves to Toronto, works to further her media and modeling career, and goes out on the dating scene. Talackova has reportedly turned down offers to star in other reality series, including a dating reality TV show reminiscent of *There's Something About Miriam* in which her being trans would have been a "shock twist" revealed to her suitors at the end.

In 2015, two successful trans-themed U.S. series began, Caitlyn Jenner's E! channel docusoap *I Am Cait* (2015–2016), and trans YouTube star Jazz Jennings's TLC network docusoap *I Am Jazz* (2015–). Both of these shows have not only further increased the fame of their respective trans celebrity protagonists but also portrayed these trans women's normal lives as integrated with concerns and issues specific to trans people. *I Am Cait* opened at the time Jenner's cover story in *Vanity Fair* was first released and documented her life following this celebrated disclosure. *I Am Cait* depicted Jenner in her home, visiting friends and interacting with family, as well as activities related directly to her social transition such as visiting a trans support group and discussing trans issues with a group of new friends who are trans. Comparably, *I Am Jazz* has followed the life and family of Jennings through her teenage years and into early adulthood. Jennings first came to public attention as a trans child when she was age 6 and from there built a sustained media presence through her YouTube channel before her docusoap furthered her celebrity. *I Am Jazz* portrays Jennings's "ordinary" life, which includes trans-specific activities such as doctor's appointments regarding medical transition, talking with teenage friends who are also trans, and contemplating the specificities of dating as a trans person. Exemplifying reality TV's ability to cross-pollinate celebrities, in 2016, trans reality TV star Isis King (discussed above) was the focus of Oxygen network's *Strut,* a docusoap about a trans modeling agency. *I Am Cait, I Am Jazz,* and *Strut* not only have provided a platform for existing trans celebrities to be depicted in a manner that renders them "special" but at the same time ordinary and familiar—arguably working to normalize their trans identities—but also have given voice and visibility to noncelebrity trans people introduced as guest stars.

Relationships With Children

An estimated one in three trans people are parents, yet scholars are only beginning to explore trans parents' relationships with children. This entry explores the unique circumstances of trans parenting, which warrant particular study within the LGBTQIA+ umbrella, and highlights the limited but growing research on trans parents and their children. It ends with suggestions for promising future directions for trans family studies.

The Uniqueness of Trans Parenting

As part of the LGBTQIA+ (lesbian, gay, bisexual, trans, queer, intersex, asexual) community, trans parents and their children face many of the same challenges that lesbian- and gay-headed families do, such as societal discrimination and lack of legal recognition. As is the case with LBG parents, courts have used ambiguities in the law and the best-interest-of-the-child rationales to withhold legal parental rights to trans people and break their families apart. Additionally, heterocentric social institutions, such as workplaces, medical centers, and schools, pose a problem for trans parents trying to obtain benefits or services for themselves or their children.

Trans parents' experiences are also markedly different from those of LGB parents: They often encounter various forms of transphobia, medical pathologization, and lack of adequate health care services that shape their experiences as individuals and parents. Whereas gay and lesbian parents increasingly turn to nontraditional pathways to parenthood, most trans parents have conceived their children in heterosexual or same-sex relationships prior to transitioning. For those who transition mid-parenthood, their developmental process of "coming out" occurs alongside their partners' and children's own developmental progressions. Thus, in such contexts, all family members interactively adapt to interpersonal and intrapersonal changes in the midst of a parent's transition, including name and pronoun modifications as well as changes in the parent's behavior (e.g., gender expressions that are more in line with how one defines oneself) and the parent's sexual orientation. These issues differ greatly from one's parent coming out as gay or lesbian, pointing to the need for research in this realm while complicating the idea of LGBTQIA+ families as an umbrella term.

Trans Parents and Their Children

A small but growing body of literature provides clinically informed accounts of some of the complexities facing trans individuals and their families, including the process of developing one's trans identity, "coming out" to family members, and shifting intimate relations and family life posttransition. In most of this literature, partners, not children, are the reference group. Furthermore, while a few studies include children of trans people under the LGBTQIA+ umbrella, children of trans people are not necessarily represented in the methodological samples.

Few studies have focused on the children of trans people exclusively. Drawing from clinical notes about 18 children of trans people in the United Kingdom, Richard Green's research published in 1998 concludes that a parent's trans identity does not have an effect on these important indicators of children's well-being: children's gender identity, experience of peer group stigma, or development. Instead, the challenges children of trans people face arise from divorce. In 2002, David Freedman, Fiona Tasker, and Domenico di Ceglie second Green's findings in clinical accounts of 18 children of trans people, emphasizing that future research should focus on the quality of family relationships. In Tonya White and Randi Ettner's 2004 article, they explore consequences for children of trans people and summarize findings from 10 questionnaires completed by therapists with trans clients. The authors find that therapists perceive young children and adults to adapt best to a parent's transition, whereas adolescents adapt the poorest; family conflict worsened the child's adaptation across all developmental levels. Later, in 2007, White and Ettner drew similar conclusions through interviews with 27 trans parents. Thus, much of what is currently known about the children of trans people comes from few studies of therapist assessments and trans parents.

There are two exceptions to this pattern. First, in 2014, Amanda Veldorale-Griffin surveyed 48 trans parents and nine of their adult children to explore how both parties experienced the parent's disclosure and transition. She found that while parents and children felt similar levels of stress relating to the transition, the types of stress they experience differed: Parents expressed fears of familial rejection and job discrimination, while children worried about bullying, changes in how they perceived their parent, and being caught in the middle of family conflict. In 2019, Jaclyn Tabor conducted in-depth interviews with 30 adult children of trans parents to explore one challenge children faced in adjusting to a parent's transition: new parental titles and pronouns. Difficulties in parent–child relationship in the years following a parent's transition were due in part to the experience of *role-relational ambiguity:* an inability to reconcile the contradictory dimensions of a parent's new identity. Tabor's article is part of a larger

ongoing project exploring the challenges emerging from a parent's transition and the coping and social support buffering against said challenges.

Future Directions

In much of the existing research on trans parent–child relationships, children's voices are absent, leading to oversimplistic conclusions about the effects of a parent's transition on children. In giving voice to children themselves, both Tabor and Veldorale-Griffin step beyond superficial comparisons of children's outcomes in trans and other families to explore *how* parent–child dynamics change as a parent gender transitions. Even so, much more scholarly and clinical analyses are needed to understand the complexities underlying a parent's transition. This will require larger and more diverse samples (particularly those considering differences based on race, class, sexuality, physical and mental disability, and other aspects of identity), more varied methodologies, and more inclusion of parents' and children's own voices. Research can expand by focusing on the different parenting experiences of trans women, trans men, and nonbinary individuals, as well as second-generation LGBTQIA+ children of trans parents.

Relationships With Family as Trans Adults

For many trans people, families can be fraught. Certainly, some family members, including parents, siblings, grandparents, and other extended family members, can be affirming and inclusive. Such affirmation and inclusion are clearly related to positive mental health benefits for trans people. But for many trans people, family members can be a primary source of discrimination. Discrimination, including violence, from family members is related to adverse outcomes for trans people. By contrast, and echoing broader social norms whereby animals are often considered part of the family, trans people report positive kinship relationships with animal companions (i.e., domesticated animals who live in the home). Such relationships can help to mitigate experiences of marginalization by other family members. Research on relationships with family for trans adults has rarely focused on nonwhite participants. It is likely that, for trans people of color, the intersections of multiple forms of marginalization will compound experiences of family marginalization. Research on relationships with family for trans adults has explored the experiences of people of a diversity of genders, with some research suggesting that nonbinary people are more likely to experience family rejection.

Effects of Discrimination and Violence by Family Members

For many trans people, family members engage in forms of discrimination that are deleterious to

well-being. Discrimination can take the form of intentional misgendering (i.e., using incorrect pronouns or names) or pathologizing (i.e., saying that a trans person is sick, sinful, or otherwise deviant simply by the fact of being trans). Discrimination can take the form of indifference from family members, with family members indicating that they do not care either way about a family member being trans. This type of indifference can be experienced as rejection, by signaling an unwillingness to engage with a person's gender diversity.

Discrimination can also involve explicit rejection by family members. This can include acting as though a person no longer exists, telling other people that a trans family member is dead, and making acceptance contingent on a person not being trans. Rejection or discrimination by family members is related to increased psychological distress for trans people and a decreased sense of social connectedness. Family rejection specifically is related to an increased likelihood of suicidality and an increased likelihood of drug and alcohol use.

Finally, some trans people experience violence enacted by family members. This violence, in addition to discrimination and rejection, can include physical violence, sexual violence, and verbal abuse. It can include withholding money for medication or withholding medication. It can include threatening to out someone as trans or actually doing so. It can include destroying gender-related personal items, including hair, clothing, binders, packers, and makeup. Experiences of family violence are related to increased psychological distress and distrust of other humans.

Animal Companions Can Mitigate the Effects of Family Marginalization

Importantly, animal companions, who are experienced by many people as constituting kin, can provide an important corrective to family violence, discrimination, and rejection. This does not mean that family violence, discrimination, or rejection is acceptable or necessarily more bearable. Rather, it is to say that relationships with animal companions can help to supplement missing relationships with human kin, serving as an important source of love and companionship. Importantly, however, trans people who live with abusive family members with their animal companions acknowledge that abusive family members may use animal companions as an additional mechanism of control. This can include withholding food or medication from animals, physically abusing animals, refusing animals entry to the home, or threatening any of these in order to control a trans family member. The abuse of animal companions, importantly, may serve as a trigger for trans people to leave abusive familial contexts.

Beyond abusive family contexts, animal companions as kin provide an important buffer for many trans people against broader societal marginalization. This is because animal companions are experienced as providing unconditional love, positive regard, friendship, nonjudgmental support, and a space for healing from trauma. For some trans people, animals are the first people to whom being trans is disclosed. In this context, animals may be experienced as providing unwavering support for gender transition. As such, animals-as-kin are often vital and much-loved family members for trans people.

Importance of Support From Family Members

Importantly, not all trans people experience negative relationships with human family members. Some trans people experience emotionally close relationships with family members, and this is related to positive mental health outcomes, increased life satisfaction, and an increased sense of connectedness to society more broadly. As such, families have an important role to play in facilitating resiliency for trans people, especially given that closeness to family can help to mitigate the effects of broader societal discrimination.

Within their families, trans people have reported greater connectedness and support from women and less connectedness and support from men in their family. Connectedness is typically facilitated by affirming responses from family members. Such responses include emotional support, using correct pronouns and names, offering financial support (such as in relation to medical treatment), advocating for the inclusion of trans people, and providing mentoring.

Prioritizing Gender Transition Over Family

Some trans people may not experience discrimination from family members but may nonetheless feel that their family members are in other ways

holding them back from transitioning. Other trans people may have concerns about the effect that their transition may have on family members. As a result, some trans people may delay transitioning due to prioritizing the needs of family members, while other trans people may feel the need to leave otherwise supportive families in order to prioritize transitioning. For some people, health care professionals can play an important role in supporting family members to understand the needs of a trans family member.

Relationships With Romantic/ Sexual Partners

Although the romantic and sexual relationships of cisgender (cis) heterosexual, lesbian, gay, and, to a lesser extent, bisexual and queer (LGBQ) people have been studied extensively, relatively little research captures the nuances of intimacies, relationships, and partnerships wherein at least one person in the relationship is trans. This entry explores the extant research and suggests future directions for scholarship on trans people and their relationships with romantic and sexual partners.

Coming Out as Trans

Coming out as trans, or disclosing one's trans identity in a relationship, can be challenging or, in some cases, life-threatening. According to the 2015 U.S. Transgender Survey, about 50% of respondents have experienced some form of rejection while disclosing their trans identity to others, and about 27% of respondents' romantic relationships ended as a result of coming out. Studies have also noted that coming out as trans is more likely to be received positively by cis LGBQ partners than cis heterosexual partners, but results are often complicated and dependent on additional social factors such as ethnicity, class background, and sexual identities of the partner and trans person coming out. For example, many Black and Latinx trans women have been assaulted and even murdered by cis men after coming out as trans, whereas white trans men and nonbinary people have tended to report relatively supportive reactions from their partners after coming out at trans or nonbinary, and the incidence of assault and murder is lower than for their Black and Latinx trans women peers. Trans people often gravitate toward trans virtual communities and resources to learn how to navigate relationships with romantic and sexual partners, and these resources have greatly proliferated over the past three decades.

Dysphoria

Gender dysphoria may be described as feelings of discomfort that one's physical embodiment—or how others perceive one's body in the world—does not match one's gender identity and felt sense of gender. Although not all trans individuals experience dysphoria, for those who do, it can be particularly challenging to navigate relationships with partners or potential partners. This is especially so if partners or potential partners have limited knowledge, experience, and communication skills around trans experience and identity. For example, coming-of-age novels about trans women's experiences, such as *Birthday* by Meredith Russo and *Palmetto Rose* by J. E. Sumerau, map complexities trans people face in

deciding when and how to disclose trans status in the context of romantic and sexual relationships. Similarly, existing empirical research finds that gender dysphoria may negatively affect romantic or sexual connections that trans people have with others if certain body parts that are often involved in intimate encounters, foreplay, and sexual activities between partners are off-limits for touching. Preferences around touching and intimate contact may also shift over time and contexts, including around social and medical transition processes.

Relationships and Transitioning

Undergoing processes of social and/or medical transitioning may produce additional opportunities and challenges for trans people when dating and cultivating romantic and sexual relationships. However, not all trans people receive gender-focused medical care or even basic wellness care. In part due to concerns about cisnormativity and anti-trans harassment and discrimination, over half of trans people in the United States do not receive any type of medical care. Disclosing processes around one's health and transition can be challenging, particularly if partners are unfamiliar with the barriers to trans people accessing safe, affordable, and effective basic and transition-related health care. Researchers have explored both cis partners' struggles around a trans partner's transition or broader gender expression and trans people's experiences navigating cis partners' actual and potential reactions to transition, or to broader gender expression within relationships. Although research studies provide a foundation for exploring both sides of such dynamics, more work is needed to tease out nuances and complexities about how transition affects relationships. Despite these documented transition-related struggles, many trans people also maintain rewarding relationships with their partners, whether the partner is trans or cis, and gain rich opportunities for mutual support, an often challenging but necessary process in a cisnormative and transphobic society.

Sexuality and Gender Identity Shifts

Experiences of dysphoria, transitioning, and coming out as trans play a part in shaping the sexual and gender identities of trans people and their romantic and sexual partners. Specifically, challenges and negotiations around identities can occur due to shifting desires and intimacies for both trans people and their partners. One of the most common assumptions around transition is that when a trans person transitions or broadens their gender identity and expression, their partners' sexual identity also changes. While this is certainly true for some trans people and/or their partners, it is not the case for all. Another common assumption is that trans people who transition or expand their gender self-expression will leave their current partners for someone better aligned with their "new" gender and sexual identities (e.g., a trans woman leaving a gay, cis man for a heterosexual, cis man). Although the sexual identities and relationships of trans people can and do change during transitions, these are not universal processes, and many couples, wherein one of the partners is trans, continue their relationships throughout the transition process. Nevertheless, some trans people may leave existing partnerships and embark upon new dating and relationship possibilities.

Self-Representation and Protection When Dating While Trans

In the parallel context of cultural fetishization and social oppression of trans people, members of these communities may engage self-protective strategies while dating and forming relationships with romantic and sexual partners. Author alithia zamantakis (2019) describes these strategies as "bodily and affective labour performed by trans/nonbinary individuals prior to and at the beginning of intimate relationships/encounters" (p. 294). These strategies may protect trans people from investing time and energy in dating those who are transphobic or who have internalized cisnormative beliefs about bodies, gender, and sexuality. Indeed, some trans women who have written autobiographical novels have noted tensions around relationships concerning bodies, gender expectations, and intimacy. Echoing these literary representations, academic researchers note how trans people often take careful measures while dating and engaging with others through online dating apps.

On online dating profiles, for example, a trans person might openly self-disclose their gender identity to ensure they do not interact with transphobic people. Trans people often engage in backstage management of what the sociologist Erving Goffman (1956) called the "presentation of the self" to ensure their own safety and to procure more appropriate dating matches. However, researchers have also described how some trans people may be compelled to engage in cisnormative desirability politics in dating contexts and to construct presentations of self driven more by cis people's desires than by their own. There are thus many factors that trans people must negotiate when dating and forming romantic and sexual relationships, such as disclosing experiences of dysphoria, social and/or medical transitioning, and coming out as trans.

Future Research Directions

With the rapid growth of social scientific interest in trans experience since the 1990s, research focusing on trans men, cis people who date trans people (although focused largely on trans men), and trans families and children has become more common. Literature on trans women and nonbinary people, however, remains comparatively scant. Because of this, researchers seeking literature on these communities typically must turn to literary studies and novels focused on and often written by trans women and nonbinary people themselves. Researchers may gain considerable insight from analyzing the literary works of trans women and incorporating systematic observations from this body of work into their empirical research. In so doing, scholars may begin to expand and more comprehensively study the relationships of trans people rather than continuing to focus largely on limited subpopulations of broader trans communities. At the same time, we may learn about nuances and variations in trans relationships within and between different groups within the trans population.

Existing research also tends to focus on the experiences of trans people's partners rather than on the dating and relationship experiences of trans people themselves. Future research on trans relationships is needed to expand beyond existing patterns in how trans relationships are studied. The factors that trans people must consider when dating and forming relationships with romantic and sexual partners are related to individual and interpersonal relationship dynamics in the context of a cisnormative and transphobic culture. Future research might well focus a sharper lens on the timeline of coming out as trans in relation to when trans people meet their romantic and sexual partners and form relationships. Additional research, both quantitative and qualitative, is needed on trans people's experiences in dating and relationships with romantic and sexual partners. As this research expands, greater attention is likely to be paid to how intersectional identity factors—such as race, ethnicity, age, social class, health, disability, nationality, and body size—interface with gender and sexual identities and embodiments to affect trans people's relationships.

Relationships With Siblings

Sibling relationships are typically some of humankind's most enduring relationships, often lasting a lifetime, yet they have received surprisingly little research attention. This is especially true regarding relationships between trans people and their siblings. These relationships can shift not only in response to gender identity disclosure and affirmation but also due to family dynamics, community interactions, and sociocultural forces acting on both the trans person and their sibling. For trans people, siblings can be sources of both support (e.g., as advocates) and stress (e.g., refusing to use a sibling's pronouns). Having a trans sibling can foster growth and altruism and also involves unique stressors. Professionals and families can nurture positive relationships for trans people and their siblings by encouraging communication, creating space for siblings' feelings, and working to remedy systemic stressors on trans people and their families—especially for youth.

Research on Sibling Relationships

The sibling relationship is common; approximately 80% of U.S. adults grew up with at least one sibling. It is often the longest-lasting relationship that people have, involving shared experiences across the life span. During youth, most siblings spend more time with each other than with parents. However, for such a formative relationship, relatively little research attention has been devoted to it, mostly relegating siblings to comparison subjects to control for genetics and/or upbringing in the study of other topics. Existing knowledge falls roughly into three realms: general sibling relationships, those of sexual minorities (e.g., lesbian, gay, bisexual, etc. [LGBQ+] people), and those of trans people, particularly youth.

General Sibling Relationships

Family systems theory holds that sibling relationships occur not just in the context of the one-on-one interactions between them but within that of the family system. A significant change for one family member can affect all members and their relationships. For example, a parent's new job with longer hours may force an older sibling into more of a caretaking role for a younger one. When a trans person comes out and begins gender affirmation, this can change multiple relationships within the family, including the sibling relationship.

Growing up, siblings exert influence on each other, with younger siblings especially affected by older siblings. Behaviors such as substance use, risk taking, and social aggression in children correlate with those of their older siblings, even controlling for other factors. Conversely, positive sibling modeling in childhood predicts more positive affect and better peer relations. Siblings may support a social transition for a same-gender trans sibling by helping them express their affirmed gender (e.g., loaning clothes) or explaining social customs (e.g., the "etiquette" of public restrooms).

Siblings are alert for and keenly aware of differential parental treatment; if such is perceived to be unfair, discord can arise between siblings. This can be more marked in societies that prize individualism, such as the United States. Because parents may need to temporarily devote more resources to trans children during transition, this may be a point of resentment for young siblings if they regard it as inequitable.

How strongly a family enforces cultural ideas about gender—whether intentionally or unintentionally—can have an impact on what roles siblings play within the family, affecting the nature of sibling relationships. For example, in certain families, sisters may be expected to help in the kitchen while their brother does not, or a son may feel freer not to marry if his older brother has already had children and "carried on the family name." A trans sibling's transition may alleviate or exacerbate such roles, depending on birth order, the "valence" of transition (e.g., whether the trans person's transition leaves their sibling as the only/eldest child of a given gender), and the strength of the existing sibling relationship.

Sibling Relationships of Sexual Minorities

Most sibling research with sexual minorities (SMs) has focused on the roots of SM orientation (e.g., twin studies) or compared life experiences of SMs with those of their non-SM siblings. A 2009 study of adolescent SM sibling relationships found that those who perceived that their sibling approved of their sexual orientation reported greater closeness in the relationship. Sisters were more often disclosed to *first* and perceived as more approving than brothers. This gendered pattern of disclosure may hold for trans people and their siblings; indeed, studies with trans youth show higher acceptance from mothers than fathers.

Sibling Relationships of Trans People

Most research including siblings of trans people (SoTP) focuses on the characteristics of trans people, using their siblings as comparison groups. That research has shown that, compared with their cisgender (not transgender) siblings, trans adults tend to have higher levels of education, live farther from their childhood home, perceive lower parental support, and be less likely to be religious, parents, or in a partnered relationship. Virtually no research to date has focused on SoTP themselves or the nature of trans sibling relationships. However, some patterns have emerged from qualitative studies from the 2010s and early 2020s with trans youth and their siblings, and others may be extrapolated from what is known about sibling relationships in general or SM sibling relationships.

Among All Ages

When a trans sibling discloses their gender identity and begins the process of gender affirmation (“transition”), this can cause significant changes in family dynamics that may affect both the trans person and their sibling(s)—positively and negatively. If SoTP have negative stereotypes about trans people or rigid ideas about gender, this may make adjustment more difficult, particularly for youth. For example, older siblings may wonder if they were partly “at fault” due to insufficient gendered role modeling (e.g., an older brother believing he should have helped “toughen up” a sibling who has come out as a trans girl). Previous exposure to factual information about, or interactions with, trans people may help SoTP adjust more quickly and easily to their sibling’s initial disclosure.

During the gender affirmation process, SoTP (like parents) may feel what psychologists call “ambiguous loss”—a sense of loss that is unclear or lacks closure—manifesting as a sense that they are “losing” a sister/brother even as they may also be happy at “gaining” a brother/sister. Transition may also change the ways that gendered scripts are enacted within families (e.g., a boy has to take on a trans girl’s former “boy chores”) and with each other (e.g., a man may ask his trans brother to be a groomsman at his wedding).

Communication between siblings about how the trans person would like their sibling to handle disclosure-related situations is key. For example, a trans person may be “out” to certain people and not others (including parents) and may want a sibling to help keep their secret. This can be a source of stress for SoTP due to fear of accidentally disclosing to the wrong person and the work of having to remember what can be shared and with whom.

Responses to the trans person from those both within and outside the family (e.g., religious community, neighbors) can affect the socioemotional well-being of their sibling(s) in two forms. First, SoTP can feel concern about how their sibling is or will be treated by others. For example, in schools and/or states without trans protections or with actively anti-trans sentiment, exposure to anti-trans discrimination may cause stress not only for trans people but for SoTP concerned for their sibling’s safety. Second, siblings themselves may experience stigma or discrimination (e.g., being cut off from extended family who do not approve of their sibling’s transition). They may also experience benefits from having a trans sibling, such as becoming activists and feeling pride at helping to improve conditions for populations experiencing oppression.

Among Youth

Perhaps due to the plasticity of youth and fewer years of habit to unlearn compared with adults, siblings are often the first family members to consistently use a trans youth’s new pronouns and affirmed name. Trans youth notice and appreciate this as a sign of support. Siblings notice their own mistakes and may judge themselves harshly for “slipping,” especially in households where a parent is seen as unsupportive.

Because they typically live in the same household, young siblings' perceptions of parental favoritism may affect the relationship more than it would for adults. In particular, the extent of parental resources that may be devoted to a trans child's gender affirmation may lead to temporary resentment by a sibling who perceives that treatment as unfair. However, siblings of children with disabilities have been found to view some degree of differential treatment as necessary and therefore acceptable; this may be true among certain SoTP.

SoTP may experience particular stressors in school environments. In many localities, trans youth are not explicitly protected at school, so siblings may feel distress about school-based mistreatment, especially at the hands of adults, and/or attempt to protect their sibling. In U.S. secondary schools, SoTP have been asked inappropriate questions about their siblings. This can be socially stressful, especially for adolescent siblings who may have heightened sensitivity to their own social standing or want to be seen as individuals, not "the trans kid's sibling."

Among Adults

As of the early 2020s, there were no known peer-reviewed studies of relationship quality among adult trans people and their siblings. The ways in which these differ from those of youth are likely to be related to length of time knowing the sibling as their assigned sex, attitudes about gender, and complexities of extended family relationships. For adult SoTP, the sheer length of time shared with a sibling prior to transition may make uptake of new name(s), pronouns, and so on particularly challenging. Siblings may also have their own children, to whom they must navigate explaining the transition in age-appropriate ways. In families with unaccepting parents, siblings may feel caught in the middle, taking on a mediator role.

Implications for Professionals

Professionals in various fields have the power to foster and protect strong and stable relationships between, and ensure positive outcomes for, trans people and their siblings. These relationships face unique challenges related to changes in family dynamics postdisclosure, the need for siblings to develop new frameworks and habits, and the influence of cultures that stigmatize trans people.

Family Counseling Implications

Because disclosure and transition affect the family system, family therapy and other family-focused interventions with trans youth should include siblings who wish to be involved, particularly during adolescence. Although separate support groups exist (both in person and online) for trans youth and their parents, few exist for SoTP. Adolescent SoTP have indicated a need for such sibling-specific spaces and appreciate them when provided; these may also be helpful for adults.

For youth, discussion and/or role-play may help families prepare siblings to handle disclosure, questions, and other common situations. Trans youth should be asked what can be shared, and these boundaries should be periodically revisited, as they may shift with age, stage of gender affirmation, or other circumstances. Adult siblings may need support to communicate similarly and discuss mutually acceptable ways the sibling can navigate other relationships that may shift due to the trans person's transition.

Trans people are highly attuned to usage of their affirmed name and pronouns. Youth may not yet have the cognitive or emotional capacity to understand the difficulty of learning new linguistic habits, so both trans people and their supportive SoTP should be reassured that (unintentional) slip-ups will happen during this process and that this is normal.

Legal and Educational Implications

Because SoTP may feel anxiety about the treatment of their siblings within communities and institutions, policies that negatively affect trans people may similarly affect siblings. For example, evidence suggests that LGBTQ people in states that pass anti-LGBTQ laws experience negative mental health outcomes (e.g., depression, suicide) at higher rates than non-LGBTQ people in the same state or LGBTQ people in similar states without anti-LGBTQ laws. Their siblings may therefore experience related distress.

In schools, SoTP report defending their sibling's right to access restrooms, fielding questions about

their sibling's anatomy by other students and even teachers, and facing social aggression themselves. School boards and personnel can ensure fair access to education by creating learning environments that protect trans youth and their siblings.

Research Implications

Owing to the dearth of extant research about sibling relationships of trans people (particularly among adult, nonbinary, and multiply marginalized populations), scholars in multiple fields have the opportunity to contribute meaningfully to this fairly nascent topic of inquiry. Interdisciplinary research may be particularly enlightening given the multiple sociocultural factors that mediate these relationships.

Religion/Spirituality of Trans People

The meaning and relevance of religion and spirituality differ across individuals. For many people, religion and/or spirituality (i.e., religion/spirituality) help them make sense of life, death, and reality and may be central to how they understand and organize life and make decisions; to others, religion/spirituality may be irrelevant. Many people find themselves reflected and affirmed in their religious/spiritual worldviews, communities, and practices. Many trans people also use religion/spirituality to make sense of their lives and experiences but may not find themselves reflected in the same way that cisgender (cis) people might. Religious/spiritual attitudes and actions toward trans people may vary from condemnation to celebration and often involve a lack of understanding or confusion about trans people and their experiences. Given the potential for negative treatment by their religious/spiritual tradition, trans people may not disclose their gender identity in order to stay connected to those communities. For those who do disclose or are known to be trans, being trans may be cause for rejection from some religious/spiritual groups or practices. Nonetheless, many trans people do find meaning and connection through participation in various religions/spiritual traditions, groups, and practices.

Definitions

Religion

Religion as a broad concept refers to an organized system of beliefs, practices, and rules that teach people an understanding of, and a formula for how to live, life. Religion is strongly connected to formation of values, concepts of right and wrong, good and bad, and justice and reward. Religion may be experienced as a supportive framework to build upon or a cage of suffering from which to escape. This experience may change during one's lifetime.

There are many religions worldwide. Some religions include belief in at least one divine being (i.e., theism/theistic), or higher power; some believe there is a spiritual essence or soul that lives in all things (i.e., animism); and others do not believe in any higher power or divine beings (i.e., atheism). Some religions include belief in repeated lives (reincarnation), while others believe there is nothing past this material life or outside human existence and focus solely on human needs and capabilities (i.e., humanism).

Spirituality and Spiritual Ritual

Spirituality refers to the activities (rituals) one engages in that often arise out of religious traditions,

which may be private and personal, public and social, or a blending of private and public. A person may use spirituality to connect to a deeper sense of themselves, to connect to others and/or to something beyond themselves, or to reach outside their physical existence. Some people describe spirituality as a mystical experience or pursuit or a way of disciplining their behaviors, thoughts, and desires. Spiritual rituals are repeated, often formulaic, actions and/or thoughts, words, sounds, and so on that are meant to bring about a state of mind, emotion, or focus for the practitioner, such as prayer, chanting, or meditation. Spiritual rituals may also be used as supplication or to express gratitude. Myriad spiritual practices across and within religions mark rites of passage (death, birth, marriage) as well as provide personal activities to feel connected (prayer, meditation).

Interconnectedness of Religion and Spirituality

Religion and spirituality are interrelated in complex ways, both containing beliefs, values, and approaches to living and dying. Spirituality is generally less formal than religion and typically without systemized rules or doctrines. While some people may speak of being "spiritual, but not religious," this frequently refers to the individual's personal rejection of organized religious institutions and may not automatically mean a rejection of religious beliefs or values.

Connections and Changes in Religion/ Spirituality for Trans People

Links Between Gender and Spirituality for Trans People

Trans people come from and embrace many religious/spiritual traditions, despite not all religions/spiritual traditions embracing trans people, and they interpret themselves through myriad beliefs about humanity and their place in the world. For some trans people, their gender and their spirituality are integrally linked. Some express a sense of their trans identity or trans experience as being a spiritual gift or a divine calling with an obligation to engage and embrace it fully as a key part of their purpose in life. Others describe a sense of divine direction or support/calling to embrace and affirm their gender that leads them to a deeper religious/spiritual experience of connection to a divine presence in their lives.

Some religious/spiritual traditions also link trans identity with unique spiritual gifts or spiritual powers. Some pagan traditions describe people who are intersex and/or trans as part of a larger divine or sacred purpose, whereas other religious/spiritual traditions treat trans people as a sort of spiritual conduit whose acceptance is necessary to develop the capacity to believe all people are sacred or holy regardless of gender or sex assigned at birth.

In some traditions and mythologies (e.g., Christianity, Judaism, and Islam), narratives speak about people on the margins of, or outcasts from, societies and the roles they play within a larger narrative of human interdependence and responsibility. Marginalized people may be used to illustrate responsibility to respond to suffering, to show hospitality, and to care for and protect the vulnerable, despite common views that may otherwise portray difference as threatening or unconnected to the interests and needs of the dominant group. Marginalized people may also appear in mythologies to demonstrate the capriciousness of life and the randomness of health and/or wealth. Some trans and other marginalized people may identify with these narratives, in which some may find a level of hope to deal with experiences of suffering and difference from the dominant group. However, even within traditions that include expectations of caring responses toward marginalized people, trans people may not feel or be included.

Religious/Spiritual Rejection of Trans People

Responses to trans people vary between groups and between official and informal views within religious/spiritual groups, as well as across members of various traditions. Some religions/spiritual traditions have broad definitions and beliefs about human differences in sex and gender, such as Native American/Alaskan Native, neopagan, and some Hindu traditions, and do not tend to reject trans people based on their gender identity. Other traditions may interpret anyone not cis and heterosexual as incompatible with their systems of belief and values regarding human biology and purpose,

such as placing human sexual reproduction at the forefront of one's purpose and obligation during life or prohibiting alteration of the physical body.

Additionally, religions/spiritual traditions and cultures may ascribe meaning and value to humans whose physical bodies do not appear distinctly male *or* female or whose understanding of themselves is different than expected on the basis of sex assigned at birth. This may result in categorizing trans people on a range from sacred to dangerous and immoral. Rejection may take the form of excommunication from a religious/spiritual community or restrictions on a person's participation in rituals, worship, or other community activities.

Rejection Based on Gender-Affirming Treatment

Religious/spiritual rejection may be related to what the trans person does in response to their gender identity. Different religious/spiritual traditions, beliefs, and values may prohibit, require, or tolerate gender-affirming hormonal and/or surgical changes. In particular, rejection may hinge on whether the person has altered their physical body through gender-affirming medical treatment. Rejection may be based on whether the gender-affirming medical treatment alters the function of reproductive organs, the perceived sexual orientation of the person, or when in life these treatments occurred, such as childhood or adulthood, prior to or after joining the religion/spiritual tradition, or prior to or after reproducing biological offspring.

Rejection Based on Fear

Rejection may also arise from intense social fear of trans and/or intersex people, who are not expected to exist according to religious beliefs and cultural expectations. The presence of social fear and violence toward what we know as intersex and trans people shows up in religious/spiritual texts as early as the ancient 12th century B.C.E., in cultures where many gods are portrayed as fearing and working to change or kill another divine being who possesses more than one sex (e.g., intersex) and gender. This historic fear of those who transgress sex and/or gender remains within many religions and cultures that consider trans people to be dangerous or immoral and hence may respond to trans people with rejection and real or threatened violence in life and after death through unending divine rejection or punishment and torture.

Rejection Based on Conflation of Gender and Sexuality

Overlaps between trans and LGBQ identities lead to mixed responses from religious/spiritual groups. Rejection may stem from conflating trans with sexual identities. There is disagreement on whether the physical body or the internal identity holds the definitive factor for determining gender in life or eternally. A few communities support actions to forcibly change a trans person's gender identity to cis. Called conversion therapy, this practice focuses on LGBTQIA+ people broadly and may include aversive techniques to suppress and/or attempt to change thoughts, beliefs, and behaviors that do not align with beliefs and values of the religion/spiritual tradition. Conversion therapy has been banned for use by mental health professionals in a number of U.S. states and in multiple countries, but trans people in many areas still encounter this type of attempt to change their gender identities.

Effects of Rejection

The relationship between religious/spiritual rejection and the struggles faced by trans people remains complex and uncertain. Trans people experiencing pervasive rejection on multiple levels often struggle spiritually, emotionally, and physically. They may carry an enduring sense of guilt, wrongdoing, shame, or self-hatred about their gender identity based on religious/spiritual teachings, beliefs, and values they have internalized and may respond with self-harming actions due to these negative internalized messages. Rejection from a religion/spiritual tradition may have an additional outsized effect beyond spirituality when medical and mental health professionals use conscience objection laws as grounds to refuse health care to trans people.

Many trans people also experience struggles with intersecting identities, expression, and belonging as they work to balance, interpret, and resolve the tension at the crossroads of learned beliefs and their experiences of themselves. Some trans people may possess resilience from remaining connected to otherwise trans-condemning religious/communities that

offer support for other experiences of marginalization and discrimination such as racism. Some trans people resolve the tension of intersecting identities through abandoning or changing religion/spiritual traditions. Some resolve the tension by working to suppress their gender identity and conform it to their sex assigned at birth. Some resolve the tension through suicide. Some remain in their communities and learn ways to manage the tension.

Trans Reconnection to Religion/Spirituality

Trans people may turn away from all religion/spirituality owing to rejection related to gender identity. Some reconnect by changing traditions, such as moving from Christianity to Buddhism. Some embrace blended or eclectic traditions like Unitarian-Universalism, and others create or join other independent communities or return to Indigenous traditions (e.g., see wernative.org). Some trans people may remain in or adopt religions/spiritualities that reflect their lives through representations of deities such as Hinduism's god/goddess Shiva/Parvati, who is half male, half female, or the Supreme Being, Brahman, who is completely genderless in name and definition.

Creating and Reclaiming Rituals

As part of reconnecting, trans people may recreate rituals to replace traditional rituals from their original religion/spiritual practices that exclude them. They may also make new rituals to celebrate and mark sacred milestones and developmental stages. Some create rebirth ceremonies to mark social and medical gender affirmations and renaming/rebaptism rituals to celebrate rites of passage in their lives.

Welcoming Communities

There are religions/spiritual groups that are welcoming and accepting of trans people. Often, they are welcoming within a broader context of embracing all LGBTQIA+ individuals. Few are officially affiliated with a religion. Examples of these groups include Dignity (Catholic), Kinship (Seventh Day Adventist), Keshet (Reform, Conservative, Reconstructionist Jews), Dina List (Orthodox Jews), and Masjid Al-Rabia (Muslim). Only one Christian denomination, started in 1968, was founded on a central outreach to LGBTQIA+ people (see mccchurch.org).

Religion/Spirituality, Support of/Opposition to Trans Rights

Trans rights include the right to housing, employment, public accommodations (e.g., bathrooms), education, and health care for trans people. Support for the rights of trans individuals varies between and sometimes even within religious communities. Although some religious groups are supportive of trans rights and may even be active in promoting them, other faith communities stand in opposition to trans rights and may actively campaign against

them. This entry outlines the support of and opposition to trans rights, beginning with a discussion of the stances of religious groups found within what are called "Abrahamic" religions and ending with a range of stances on trans issues from other major faiths outside of Abrahamic traditions.

Abrahamic Traditions

Abrahamic religions are monotheistic, meaning that they believe that there is only one god. Abrahamic religions have their roots in the patriarch Abraham, a major biblical figure recognized by several religious groups, including Jews, Christians, and Muslims. Since about 2014, support for trans rights among Abrahamic traditions has been increasing, with greater inclusion and support for trans members and outsiders to the faith. Yet, support for the rights of trans individuals can vary drastically within individual churches, mosques, and synagogues, and official denominational policies regarding how trans people can participate in the faith community also vary. The first section of this entry will explore supports for and opposition to trans rights within Abrahamic faith traditions.

Catholicism

Pope Francis, the head of the Catholic Church since 2013, has been more conciliatory toward LGBTQIA+ people than past popes. For instance, he has held meetings with trans people to discuss their concerns, going so far as to invite them to the Vatican, and he has called for open dialogue and better understanding of the experiences of trans individuals. Yet the pope has criticized gender theory, stating that such theories ignore the way God designed the world. Officially, the Catholic Church's understanding of gender remains binary, meaning that gender is believed to be found in only two distinct forms, male and female. The Catholic Church also does not believe that gender identity is distinct from biological sex. As of 2015, trans Catholics are not permitted to become godparents (who are traditionally responsible for a child's religious upbringing in the event that something happens to the parents).

Formal church documents synthesize the Catholic Church's stance on trans rights. In 2019, the Congregation for Catholic Education published a statement called "Male and Female He Created Them: Towards a Path of Dialogue on the Question of Gender Theory in Education." This statement is designed to support those who work in Catholic schools and educational settings (e.g., parents, teachers, staff, bishops, priests). The document, which frames the fluidity of sexuality and gender as being situated within a particular cultural context, rejects the fluidity of gender and the separation of sexuality and gender. In sum, at the top of the Catholic Church hierarchy, trans individuals face exclusion.

However, within the Catholic Church are individuals, local congregations, and Catholic-based ministries that work to support trans individuals. For instance, New Ways Ministry, a blog devoted to Catholic LGBTQIA+ news, has a section specifically devoted to trans issues and supports. At the individual level, a 2017 Pew Research Report suggested that 46% of Catholics believe that gender is not determined at birth, which is higher than for other Christian groups (e.g., Evangelical Christians, Mainline Protestants). Additionally, support for trans students at Catholic universities and colleges is increasing, driven by student calls for more expansive protections for LGBTQIA+ students.

The Church of Jesus Christ of Latter-Day Saints

Like the Catholic Church, The Church of Jesus Christ of Latter-Day Saints has a central governing body and a hierarchical leadership structure. This structure means that decisions are generally made from the top down, with little input from those at the bottom (the local level). In early 2020, the church published an updated version of its "General Handbook: Serving in The Church of Jesus Christ of Latter-Day Saints," which included guidelines for what a trans person can do in the church. Yet trans members who elect to medically or socially transition, or who change their name and/or pronouns, may face membership restrictions and may not be able to fully participate in church life.

Overall, the church has softened its stance on trans rights issues. For instance, the church publicly supported the federal Fairness for All Act. The bill aims to protect LGBTQIA+ people from housing and employment discrimination.

Eastern Orthodox

The Eastern Orthodox Church lacks a central governing body. As of 2018, no council of bishops has put forth a formal policy on trans issues in the United States. However, many church leaders have spoken against and written about gender reassignment, considering it to be against God's plan for creation. There are inclusive Orthodox churches, generally located in larger cities in the United States (e.g., Boston, Washington, D.C.), that welcome all people regardless of sexual and gender identity.

Evangelical Christianity

Evangelical Christian beliefs about gender have excluded trans individuals from participating in Evangelical communities, which typically view nonnormative forms of gender and gender identity as unacceptable and even as a sin. Evangelical Christians, particularly those who identify as white, tend to support policies that allow the government and private businesses to discriminate against people who are trans in workplaces, housing, schools, and beyond.

Some Evangelical Christian denominations have published documents concerning their views on trans issues. For instance, in 2014, the Southern Baptist Convention (one of the largest Evangelical Christian denominations) published a statement entitled "On Transgender Identity," defining gender as being a male/female binary and stating that having a trans identity goes against the Bible's teachings. While the statement calls for love and compassion for trans individuals, it also opposes physical alterations (e.g., hormone therapy, gender reassignment surgery) and any efforts to normalize having a trans identity. The Nashville Statement, an Evangelical Christian statement of faith published in 2017 by the Council on Biblical Manhood and Womanhood, was signed by tens of thousands of Evangelical Christians (e.g., prominent church pastors, theologians, editors, professors). The Nashville Statement states that having a trans identity is inconsistent with God's creation and plan for the world.

Jewish

Judaism comprises three main branches, including Orthodox, Conservative, and Reform Judaism. The rights of trans individuals vary within these groups. Likewise, trans people face differing degrees and types of limitations and exclusions in these communities.

Orthodox Judaism

The Orthodox Jewish tradition is organized and socially structured by gender: Men and women occupy separate spaces and have separate roles. Trans people are constrained within Orthodox Judaism: If, for instance, they have not medically transitioned, the trans individual may face restrictions about where they can sit during services, particularly if they do not fit a rigid definition of male or female. Gender reassignment surgery is forbidden on the basis of scriptural teachings. Trans individuals from Hasidic Jewish communities face expulsion from their communities and shunning for their families upon coming out.

A number of nonprofits working to support LGBTQIA+ individuals from Orthodox communities include Jewish Queer Youth (JQY), Eshel, and the World Congress of GLBT Jews: Keshet Ga'avah. Organizations like these provide resources, family programming, and networking opportunities and actively work toward inclusion and acceptance in Orthodox Jewish communities.

Conservative Judaism

Conservative Jewish communities have mixed views on the rights of trans individuals. Yet some steps toward inclusion have been taken by Conservative Judaism at large. For instance, in 2003, the Committee on Jewish Law and Standards declared that gender-affirming surgery was permissible. In 2016, the Rabbinical Assembly, an international association of Conservative Jewish rabbis, passed a resolution affirming the right of trans individuals to be fully welcomed and accepted into Jewish life.

Reform Judaism

Reform Jewish communities, operating largely as individual entities, are generally fully welcoming and inclusive, with explicit policies on nondiscrimination regarding gender identity and membership/family life. For instance, Reform Judaism allows for the ordination of trans rabbis

and encourages its communities to be fully inclusive of trans individuals. Reform Jewish camps and the Reform Movement youth group (The North American Federation of Temple Youth) have become more inclusive of trans and gender-nonconforming children and young adults.

Mainline Christians

Mainline Christian denominations are mixed when it comes to supporting trans rights. For example, some are fully open: The Presbyterian Church (U.S.A.), United Church of Christ, and the Episcopal Church are affirming, and their churches support trans clergy serving in leadership positions. Other denominations, such as the United Methodist Church, have split or are planning to split because of differences in beliefs about LGBTQIA+ rights and inclusion.

Historically, Black churches, such as the African Methodist Episcopal (AME) Church, have long been influential in guiding day-to-day lives of African Americans within the United States. Yet these churches have largely been unwelcoming to people with trans identities, either downplaying the existence of these individuals or outright condemning them. However, while no largely African American denomination has issued a public statement about trans issues, some historically Black churches and related organizations, such as Many Voices, have made progress toward becoming more welcoming, publicly recognizing those of different gender identities and calling for their inclusion within faith communities.

Muslims

Because there is no central governing body in Islam, individuals and institutions range from welcoming and inclusive to being rejecting and even violent. As with other conservative religions, traditional readings of Islam's sacred texts have been used to oppress trans individuals. However, progressive scholars argue that the Qur'an is open to interpretation and does not explicitly speak of trans issues. Muslim organizations, such as Muslims for Progressive Values and the Muslim Alliance for Sexual and Gender Diversity, offer communities for those seeking more inclusive interpretations of Islamic texts. Some progressive mosques, such as Toronto's Unity Mosque, invite trans Muslims to attend and fully participate, without hiding their gender identity.

Unitarian Universalism

The Unitarian Universalist Church, a spiritual-minded community based on teachings rooted in science, philosophy, world religions, and individual experience, actively supports trans individuals in policy and practice, providing educational resources (e.g., websites, courses) for its congregations toward being inclusive. It has also supported the Employment Non-Discrimination Act (2007), calling for its members to speak out against intolerance against LGBTQIA+ people. The Unitarian Universalist Church hosts an annual Transgender Day of Remembrance. It has also ordained trans ministers.

Other Faith Traditions

Some non-Western religions offer a theological structure that allows for gender-variant beings—in other words, individuals who do not strictly adhere to the concept of an unchanging gender binary. Such a structure can lead to greater support of trans community members. This section explores these religions and their stances on trans rights.

Buddhists

Buddhism does not have a clear doctrinal statement on the treatment of trans people. Although some temples and monasteries may ban trans people from leadership positions, there is no overall consensus. The Five Precepts, which serve as moral guidelines for Buddhists, draw awareness to human suffering and call for compassion and kindness toward all people. Concepts of karma allow for manifestations of gender fluidity to be more readily accepted in Buddhist communities. Most American Buddhists favor laws protecting trans individuals from discrimination.

Hindus

Because there is no central Hindu authority, attitudes toward trans issues vary at different temples and ashrams. The Vedas (sacred texts)

refer to a "third sex," and some Hindu deities are gender fluid. Trans visibility within the Hindu community is increasing. For instance, in 2019, during Kumbh Mela, India's largest religious festival, Kinnar Akhara (a Hindu ascetic order founded, led, and composed of trans women) were welcomed to participate in the festivities and were given the same supports as other orders (e.g., housing, resources).

Native Americans

Traditionally, many Native American groups included the concept of "two spirit." Two-spirit people were those who possessed both male and female qualities, constituting a third gender. These people were considered sacred, possessing the spirit of a man and a woman, and seen as more spiritually gifted. When the actions of government agents, boarding schools, and white colonists resulted in the loss of many Native traditions and communities, two-spirited people and practices went underground or disappeared in many tribes. While some Native trans individuals may not identify with the term, given that it captures both masculinity and femininity, others are pushing for a revival of the two-spirit role.

Reparative Therapy

Trans reparative therapy is an umbrella term for sustained efforts that seek to discourage behaviors associated with a gender other than the one assigned at birth and/or promote gender identities that are aligned with the person's gender assigned at birth. It is predicated on the view that being transgender or markedly gender nonconforming is pathological and that transitioning should be avoided if at all possible. Reparative therapies are known by many names: conversion therapy, reparative practices, the corrective approach, the psychotherapeutic approach, and the pathology response approach. Different terms highlight different aspects and subtypes of reparative therapy. This entry addresses the practices' current social context, the differences and similarities between reparative therapy targeting sexual orientation versus gender identity, the defining features of contemporary approaches, the practices' harmfulness and unethicality, and the legal regulation of reparative therapy.

Social Context

Although reparative therapy targeting sexual orientation is no longer described as clinically acceptable in the scholarly literature and most commonly takes the form of unlicensed faith-based practices, trans reparative therapy remains unfortunately common among licensed professionals. In the

United States, 9% of trans adults have reported that a professional tried to stop them from being transgender.

Trans reparative therapy by licensed professionals primarily targets prepubertal children because of the belief that gender is no longer malleable after puberty. However, recent years have seen a worrisome increase in clinicians seeking to justify extending reparative practices to adolescents and adults. The unsupported hypothesis of rapid-onset gender dysphoria, which posits that social pressures and mental vulnerability are leading adolescents to suddenly and falsely believe that they are trans, is being used by some clinicians and scholars to shed doubt on the identities of trans adolescents and delay or deny access to transition-related care. The leading international trans health organization, the World Professional Association for Transgender Health (WPATH), was the subject of a 2018 controversy when it elected a treasurer who had recently coauthored a paper arguing that trans reparative therapy on consenting adults can be ethical. Despite strong opposition by individuals working in trans health, the board of directors dismissed the concerns as unfounded, ideologically motivated, and defamatory.

Targeting Sexual Orientation Versus Gender Identity

Reparative therapy targeting sexual orientation and gender identity is often distinguished. Their histories diverge notably with regards to the age of patients, their relationship to faith, and whether they were theorized through peer-reviewed publications. However, neither solely targets sexual orientation or gender identity. Practices pathologizing same-sex attraction also pathologize being trans, while leading trans reparative practices target gender-nonconforming behaviors regardless of whether the children express a clear trans identity. One of the leading historical figures of trans reparative therapy, George Alan Rekers, figures in both traditions. Rekers employed behavioral techniques to prevent gender-nonconforming children from growing up gay or trans. He was motivated by religious belief and later served on the board of a leading gay reparative therapy organization, the NARTH Institute. While contemporary forms of trans reparative therapy reject the prevention of homosexuality as a legitimate clinical goal and do not adopt faith-based justifications, Rekers had a strong influence on their development. Rekers's coauthor, Ole Ivar Løvaas, is known for developing applied behavior analysis, which has been likened to reparative therapy for autistic children.

Defining Features

Trans reparative therapy commonly applies an etiological lens to trans care, looking for external causes under the belief that marked gender nonconformity and/or identification with a gender other than the one assigned at birth reflects abnormality rather than atypicality. This belief is often reflected in the language used, referring to people as their gender assigned at birth (e.g., calling straight trans women "male homosexuals") and labeling their gendered self-understanding "gender confusion" or "gender identity problem." The influence of psychoanalytic thought on trans reparative therapy is evident in the tendency to attribute to fault parents and especially mothers for causing or fostering patients' gender identities or expressions. Other proposed factors include social contagion, attitude toward rough-and-tumble play, past trauma, conflation of gender nonconformity with gender identity, co-occurring mental illnesses, sexual orientation, and cognitive development. Some authors have suggested that some children assigned as male at birth may prefer feminine toys and names because their lower cognitive development make them uncompetitive in masculine play. For adults, suggested causes include desire to attract gay men (among queer transmasculine people), desire to attract straight men or internalized homophobia (among straight transfeminine people), and paraphilic heterosexual self-eroticization (among queer transfeminine people). While biological factors are often acknowledged, they are downplayed in the analysis and treatment recommendations.

Whereas the trans reparative therapy espoused by Rekers and Løvaas employed behavioral techniques such as a token economy for punishments and rewards, contemporary approaches tend to employ a broader variety of techniques under the belief that behavioral approaches may fail to alter internal gender schemas. For adolescents and adults, systematic misgendering, psychotherapy

aiming at identifying causes for gender identity, and undue delays or barriers to transition are commonly employed. For children, suggested psychosocial interventions include play psychotherapy, parental counseling, and interventions in the naturalistic environment. Parents are encouraged to limit, discourage, and/or ignore gender-nonconforming behaviors at home while supporting and/or encouraging gender-conforming ones. Peer relationships with people of the same gender assigned at birth are also encouraged.

Proponents of trans reparative therapy claim that their approach is justified by the reduction of peer ostracism, the treatment of underlying mental illness, and the prevention of trans outcomes for its own sake. Early important statements of the approach viewed these justifications as obviously valid and consistent with prevailing ethics and as a result mobilized little effort in fleshing out their justificatory matrix.

The goal of preventing trans outcomes is associated with claims that the desire to medically transition is too radical to be part of normal human diversity, that the distress inherent to gender dysphoria makes it psychopathological, or that having a gender identity that does not correspond to one's gender assigned at birth is inherently a marker of distress. Proponents do not typically present empirical evidence that trans reparative therapy leads to better psychosocial outcomes than affirmative approaches, instead using vague references to common sense or clinical experience for theoretical support. The proposed ethical underpinnings of trans reparative therapy remain sorely undertheorized and appear to take root in gender normativity. If they were obviously consistent with the ethics of 1995—and this author would argue otherwise given contemporaneous critiques—they are certainly not so today.

While the literature acknowledges that gender identity is not malleable in adolescence and adulthood, it is more difficult to establish whether altering gender identity or preventing trans outcomes prior to puberty is possible. Early theorizations of trans reparative therapy relied on case reports as evidence of the malleability of gender identity, gender expression, and sexual orientation. Contemporary trans reparative therapy appeals to the research program known as *desistance research* as evidence that gender identity is malleable, since most children referred to gender identity clinics do not go on to medically transition. However, these studies have been starkly criticized for their failure to distinguish between youth who expressed a trans identity and youth who did not. Gender nonconformity frequently motivates gender clinic referrals. Data suggest that transgender and cisgender children sharing the same gender identity are highly similar and that childhood gender identity is a strong predictor of later gender identity. Critiques of desistance research have, however, challenged the usefulness of predicting adult gender identity, favoring an affirmative, flexible, and nonjudgmental approach.

Harmfulness and Unethicality

Trans reparative therapy appears to be harmful regardless of whether the person remains or grows up to be trans. Evidence of harm primarily appears in the self-report of ex-patients of clinics engaging in trans reparative practices. Drs. Sé Sullivan and Karl Bryant have recounted and theorized the harm they experienced at the hand of these clinics, and Erika Muse has testified before the Ontario legislature in support of a law prohibiting reparative therapy. Bryant (2006) explained that although he grew up to be cisgender and gay, the approach "made me feel that I was wrong, that something about me at my core was bad, and instilled in me a sense of shame that stayed with me for a long time afterward" (p. 25). Because the practices target gender nonconformity and negatively affect parental attachment, negative psychological outcomes are not dependent on later gender identity. Shame and parental attachment problems are strongly correlated with self-esteem problems, anxiety, depression, and suicidality. Kirk Murphy, who was lauded as evidence of the success of Rekers's approach in 17 of his publications, completed suicide in adulthood. His family has blamed Rekers's approach for his suicide.

Quantitative evidence of the harm of trans reparative therapy is rarer, and no randomized controlled studies exist. Trans adults having undergone reparative therapy show much higher levels of suicidality and depression, an effect that is even starker among those who underwent reparative therapy in childhood. By contrast, studies suggest that the gender-affirmative approach leads to lower psychopathology than reparative approaches.

Notably, trans children who socially transition show levels of anxiety and depression comparable to cisgender peers. While no randomized controlled trial exists comparing the two approaches, the currently available evidence suggests that trans reparative therapy leads to worse outcomes than alternatives.

Critiques of reparative therapy are not solely predicated on harm, however. Many leading professional associations oppose trans reparative therapy as unethical and maybe harmful, distinguishing the question of ethics from that of overall harm. Trans reparative therapy is arguably inherently demeaning of trans people. The validity of parental consent to reparative practices is also questionable, since they often hold transphobic beliefs or are misled by well-credentialed clinicians. Some of the proposed justifications of trans reparative practices are reminiscent of eugenic and victim-blaming logics. Given professionals' duty to respect the dignity of their patients and avoid unnecessary harm, the transphobic nature of trans reparative therapy and anecdotal accounts of harm are sufficient grounds to declare it unethical.

Legal Regulation

Many jurisdictions have passed laws prohibiting trans reparative therapy. These laws typically prohibit reparative therapy targeting sexual orientation, gender identity, and gender expression. While laws have a limited impact on practice, notably because of their ambiguous scope, they contribute to culture changes and offer trans communities an additional advocacy tool. In Canada, the 2015 Ontario law was instrumental to the closure of the long-criticized Toronto CAMH Gender Identity Clinic for Children and Youth.

Bans on reparative therapy have been accused of violating therapists' freedom of speech and of violating familial religious freedom, parental authority, or patient autonomy. Court challenges have been unsuccessful. Psychotherapy is considered an action rather than mere speech, since it seeks to effect a change in the patient rather than persuade them of something. While familial religious freedom, parental authority, and patient autonomy are relevant to health care decisions, they can only grant a right to refuse treatment. No right to demand a specific treatment exists. It is legally well established that governments can prohibit treatments that have not been shown to be safe and effective. Indeed, courts have not only refused to invalidate bans on reparative therapy, but some have begun to understand repeatedly discouraging and opposing transition as a form of family violence.

In the absence of reparative therapy bans, professional liability law and codes of ethics may provide a means of sanctioning trans reparative therapy. Professionals must act competently and respect the standards of care of their profession. Since many leading professional associations and the leading standards of care in trans health consider trans reparative therapy unethical, engaging in reparative practices may give rise to legal liability and disciplinary measures. However, effectively discouraging trans reparative therapy depends on effective enforcement and shifts in professional culture.

Political polarization and the rise of conservatism are unfortunately beginning to seep into trans health. Care for transgender youth has grown, increasingly receiving mainstream attention in recent years. The new, unsupported theory of rapid-onset gender dysphoria is being used to oppose affirmative care for adolescents, and newspapers in the United Kingdom are attacking the national gender clinics for allowing youth to transition, despite their approach falling on the conservative side of trans health. After a steady decline over the past decades, trans reparative therapy may be heading toward a dangerous revival.

Representations in Popular Culture

Popular culture and media representations are cultural narrators through which social norms are disseminated. As a result, media have the profound ability to shape the way we see and navigate the world and how others engage with us. Given this impact, it is important to consider how media have represented binary and nonbinary trans people. This entry will examine "looking relations" and how these produce the cisgender gaze. This gaze will be used to discuss early representations (e.g., gender code, proxy-representation, dominant tropes) and contemporary applications and issues, such as the transition narrative, oppression narratives, and transface. The entry concludes by discussing the importance of community-driven media.

Looking Relations

Much of trans representation can be understood through a primary analytical tool: the cis gaze. The cis gaze is a term derived from feminist film theorist Laura Mulvey's (1975) groundbreaking concept of the "male gaze." To oversimplify a complex analytical framework, the male gaze is a critical concept used to examine how women in film have been reduced to objects of fascination and something to be looked upon from a male perspective. This gaze is developed through a complex relationship between Hollywood's continued reliance on straight male directors, the placement of the camera within a film's scene, and the film industry's presumption that most film audiences are also predominantly straight, cis, white men. As a result, a male perspective or "gaze" becomes equated with "normal and natural," and women become seen as "Other"—something distinctly external from the intended point of view of the film. Audiences, regardless of gender, then internalize this perspective as the norm through which to view the world. This phenomenon is called *looking relations,* whereby those in power wield the gaze, while those marginalized are looked upon and seen through the eyes of those in power. In essence, looking relations promote the objectification and dehumanization of the subordinate group, as well as the hegemony of the dominant group. This objectification is facilitated by three principle cinematic elements (filmmaker, camera, and audience), which work in concert to promote and normalize the male gaze through an assumed "shared" experience. However, owing to the deeply ingrained nature of the male gaze in Western cinematography, almost all films, even those trying to subvert it, perpetuate some form of this gaze.

The Cis Gaze

What made the concept of the male gaze so impactful was its ability to uncover a way of seeing that had previously gone undetected or was taken for granted: the tendency to view the world through the eyes of men and to naturalize this perspective. In other words, the gaze was (and is) always already present—we just did not have the tools to identify, and thus decentralize, this omnipresent point of view. Conceptually, the male gaze provided an instrument with which to dislodge dominant cultural patterns of "viewing" the world. Like the male gaze, the cis gaze also helps identify the insidious patterns of viewing the world, and gender phenomena, through the eyes of a cis person.

The cis gaze was born out of Hollywood's ubiquity of cis filmmakers, a cis camera perspective, and the assumption of a cis audience. Most popular culture that features trans characters or narratives tends to focus on how trans lives are distinctly

different from a cis experience or codifies gender in ways that normalize conforming to one's sex as assigned at birth. Trans people become spectacle, inherently interesting simply because they are portrayed as "different" from the film's intended cis audience, even if the trans characters are doing little other than merely existing. Through the cis gaze, trans experiences are constructed as "Other" to a cis norm, even when the film seeks to cultivate compassion or produce a sympathetic narrative.

The concept of the cis gaze signifies an attempt to categorize and analyze film's development of trans narratives and not an inherent condemnation of it. Like the male gaze, the cis gaze is a tool that allows the audience to see and identify what is deeply ingrained within looking relations. Although a cis gaze sensationalizes trans experiences, which can lead to real-life trans people being seen as "weird" or "freakish," many films made with a cis gaze have helped to nurture a sense of sympathy and increased knowledge about the lives of trans people within Western cultures. A cis gaze is not a zero-sum game, neither wholly "good" nor wholly "bad," but simply a critical concept useful for discussing recurring themes and issues of gender within popular culture.

Gender Codes and Proxy-Representation

Within popular culture, the cis gaze codifies gender in a way that conveys particular sets of meanings and reproduces particular sets of norms. In other words, the cis gaze uses gender codes in a way that represents some gender expressions as normal, while others are constructed as deviant. Gender codes refer to how masculine and feminine signifiers are used to subtly convey meaning; typically, this is exemplified by cross-gender or gender-transgressive codes. Specifically, *gender codes* refer to clothing, mannerisms, behavior, intonation, and other aspects of oneself that convey masculinity or femininity. These codes come together to create proxy-representation of trans people, which, in turn, paint a picture to the public about what it means to identify as a gender that does not align with the sex you were assigned at birth. *Proxy-representation* refers to representations of gender that contribute to the dominant ideologies about trans people; these representations are not necessarily trans, but they inform how media consumers *think* about trans people. For example, the title figure in *Mrs. Doubtfire* was not trans, but Robin Williams's character did cross gender boundaries.

Of course, proxy-representations can be both good and bad: good, as they have allowed trans people to see themselves when representations have been limited or harmful, but bad, as they have a history of contributing to stigmatization and transphobia. Proxy-representations contribute to the dominant narratives and tropes in popular media outlets. Emerging from film studies, a *trope* is a universally identified image imbued with several layers of contextual meaning, as well as a commonly recurring rhetorical device or cliché in a creative work.

Dominant Tropes

To understand how trans people have been represented through a cis gaze requires more than the examination of explicit representations, since trans representation as we know it today has only become prevalent in the past few decades. Rather, we must analyze how, through the cis gaze, cross-gender codes function as a type of proxy-representation for trans people, which, in turn, discursively produce and instill cisnormativity. The following sections will examine three common tropes: the feminine joke trope, the deception and disguise trope, and the nefarious trope.

The Feminine Joke Trope

The *feminine joke* is a trope that uses cross-gender codes, specifically femininity, as the brunt of a joke or punchline and humor that relies on feminine gender coding. Typically, this is exemplified by men in dresses being depicted as inherently laughable or ridiculous, which has a clear dehumanizing effect on feminine people. This trope also contributes to the tendency to view femininity as artificial or inauthentic while supporting the idea that genders that "cross" are inherently worthy of ridicule. Some examples include Robin Williams in *Mrs. Doubtfire,* Eddie Murphy's Fat Mama in *The Nutty Professor,* Tyler Perry's Mabel "Madea" Simmons, Martin Lawrence in *Big Momma's House,* and Jack Lemmon and Tony Curtis in *Some Like It Hot.* And yet, while audiences may roar with delight at the sight of a presumable man dressed femininely, scholars have

noted how the same gender configuration would evoke fear, outrage, violence, and discomfort if encountered outside of a performance on stage or screen (e.g., on a bus or walking down the street). Given how the feminine joke contributes to the ideology that cross-gender codes are artificial or inauthentic, this trope fuels another common trope: deception and disguise.

The Deception and Disguise Trope

Deception and disguise refers to how cross-gender codes are used for deceptive purposes: having an ulterior motive or for the purpose of trickery or deceit. Similarly, this trope often uses cross-gender codes in the form of a "disguise" as a plot device, whereby the premise of the storyline revolves around a person concealing their identity and their "true" identity then being revealed. Such a device not only upholds the idea that gender conformity is more authentic, natural, and sincere but also upholds gender essentialism—the attribution of fixed, intrinsic, innate, and biologically determined qualities to men and women, as per their sex assigned at birth. Some examples of this trope include the Wayans Brothers in *White Chicks,* Disney's *Mulan,* Robin Williams in *Mrs. Doubtfire,* Nathan Lane in *The Birdcage,* Amanda Bynes in *She's the Man,* and even *Bugs Bunny.*

The Nefarious Trope

Finally, and perhaps most problematically, there is the nefarious trope, which uses cross-gender codes to depict people who "cross-gender" as villains and serial killers. The nefarious trope is a progression of the deception and disguise trope: *If someone is deceptive or is using a disguise, they must be up to no good!* Within this trope, cross-gender codes are used to signal that someone is a villain or to give someone a villainous persona. Oftentimes, these codes are covert and inconspicuous, as illustrated by many Disney villains, such as Scar in *The Lion King,* Jafar in *Aladdin,* Ursula in *The Little Mermaid,* and Tamatoa in *Moana.* Within these examples, characteristics such as flamboyancy, femininity, talking with a lisp, and being prim, wanton, or vain are used as gender codes to signal the characters' immorality. In addition, these gender codes accentuate a character's "insanity," serving no other purposes than to highlight their mental state (e.g., Buffalo Bill, *Silence of the Lambs;* The Goblin King, *The Labyrinth*) or to depict a disorienting or debaucherous scene (e.g., Frank-N-Furter, *Rocky Horror Picture Show*). The nefarious trope, in conjunction with the disguise trope, also produces the "surprise reveal" narrative, whereby a character "crosses" gender to either lure unsuspecting love interests or for some other ulterior motive (e.g., Einhorn, *Ace Ventura Pet Detective;* Dill, *The Crying Game;* Ava, *Nip/Tuck*). All of these tropes teach their audiences to be distrustful of people who transgress the sex they were assigned at birth.

The Rhetoric of Deception

These tropes come together to create the *rhetoric of deception:* a legitimizing discourse that uses the stereotype that trans people are deceivers to promote and excuse the violence they face. For example, when people who transgress the sex they were assigned at birth are depicted as worthy of ridicule, deceptive, having an ulterior motive, and nefarious, such a construction can serve as a justification for violent responses (e.g., the disproven panic defense) within the minds of popular culture consumers. Consequently, the outcome of these tropes is the ever-prominent dichotomous narrative of trans people as either victims or villains, which represents a cautionary tale for trans individuals. In other words, crossing the sex you were assigned at birth is characterized by victimhood or a tragic life—as is the case with Rayon (*Dallas Buyers Club*), Brandon Teena (*Boys Don't Cry*), or many of the trans victims on *Law & Order, Special Victims Unit*. These types of representation thus have a disciplinary and regulatory power.

Moreover, while popular media outlets have begun to show signs of change in terms of how trans people and gender in general are depicted, many of these tropes continue to surface in children's content. This is a particularly concerning pattern, given how children learn gender and are indoctrinated with gender norms from a very young age (e.g., the social construction of gender). The lesson begins with assigning culturally gendered colors and codes to an embryo (e.g., "It's a girl, we'll paint her room pink!") and progresses into lessons that regulate and caution young children not to deviate from their assigned sex—as deviations are for victims or villains. So, while

representations have begun to shift in terms of some of these tropes, many of them remain within children's content, which ultimately fails to uproot cissexism and transphobia in their systemic form: childhood gender socialization.

Contemporary Applications and Issues

While the issues of past representations have yet to be dispelled from modern cinema and popular culture, most representations of trans narratives in the early 21st century have developed a distinctly more compassionate view. However, even this welcomed trend has shortcomings that bolster cisnormativity.

While all films that feature "gender deviancy" could be placed within the framework of a cis gaze, it is worth discussing the cis gaze in a more modern context—a time when popular culture has begun to handle trans characters and storylines more explicitly, rather than relegating them to subtext. Revisiting the male gaze, films can adopt a male gaze without women being present in a narrative (e.g., framing more feminine men or men of color as "Other"), but the male gaze is best understood through explicit examples involving women characters—when the gaze is on women. Likewise, the cis gaze is best understood through explicit examples that gaze at trans people.

Hollywood's reliance on a cis gaze that privileges "fantastical" tales of the "Other," along with its historical tendency toward slightly left-of-center social progressivism, means that most explicit trans narratives have been sympathetic toward trans lives. However, as cinema is a visual medium that thrives on the power of juxtaposition, this has led these representations to fall into two major narratives: transition and oppression.

Transition Narratives

In transition narratives, the film's story focuses on how trans lives deviate from cis ones in a linear framework. This narrative is not surprising, given the cultural preoccupation with makeover stories, or "before and afters." Western audiences devour dichotomous, linear narratives that center on self-actualization or "improvement" (even home improvement). The story begins with a trans character living as an ostensibly cis person (i.e., as their sex assigned at birth). The film begins by centering this character's coming out as trans and their decision to live as the "opposite" gender. As the story progresses, the trans character begins to distinguish themselves by "diverging" from their assigned sex and aligning with cis people of their authentic identity. For example, a trans woman may take hormones to develop breasts, start wearing makeup, or undergo gender-affirming surgery. Mirroring a film's typical three-act structure, the transition narratives are sequenced as follows:

1. Beginning with a "normal" cis status quo
2. Entering a period of emotional and gender norm upheaval
3. Returning to a new "normal" status quo within another gender identity, typically one that is still accepted and commonly understood within a binary gender model

Transitions within this narrative typically move from a male-to-female or female-to-male experience, which is a by-product of the cis gaze. In other words, there is an assumed "destination point" that cannot encompass identities like genderqueer or nonbinary. This move to "opposite yet normalized" is intended to make the transition more understandable and palatable to an audience that is presumed to only be aware of and comfortable with male and female experiences. The Oscar-winning 2015 film *The Danish Girl* showcases such a transition narrative.

Oppression Narratives

Facilitated through the cis gaze, oppression narratives focus less on the visual or embodied distinctions between trans and cis lives and more on social distinctions. In oppression narratives, the story focuses on how trans people are subject to myriad forms of prejudice and discrimination while simply trying to live their everyday lives. As the story progresses, the trans character fights back against these injustices, often succumbing to the toils of their existence by death or punishment. Of course, the audience is meant to pity or become moved by the sheer magnitude of suffering that a trans person must endure simply for existing and how their lives are portrayed as horrendously

dangerous and unlivable. However, oppression narratives rarely allow for any understanding of what it means to be trans beyond the confines of oppression. Trans people in oppression narratives are depicted as not having the opportunity to enjoy life or to have interests that are not eventually overshadowed by pain. The films *Boys Don't Cry, Dallas Buyers Club,* and *A Fantastic Woman* are prominent examples of oppression narratives.

Oppression and transition are not discrete narratives; they often overlap. In fact, it is rare to find a film focused on a trans character's transition that does not also show them overcoming bigotry. Equally, it is rare for a film about a trans character overcoming oppression to not also include scenes devoted to them learning how to "properly perform" their gender and "pass."

Transface

The cis gaze also fuels recent conversation surrounding *transface:* the practice of trans characters being played by cis actors of the wrong gender (e.g., a trans man played by a cis woman). The colloquial term *transface* takes its name from the racist practice of blackface in vaudeville shows and early films. While there are certainly similarities between the two, the parallel has been criticized, mainly by members of Black communities in the United States, for failing to recognize the unique experiences of Black people within a white supremacist system. Although this discussion uses *transface,* as it is currently the most widely used term, readers are encouraged to analyze both the benefits and weaknesses of the comparison.

As trans characters are typically portrayed by cis actors, who identify with the assigned sex of their character, transface often reinforces the biodeterministic underpinnings of gender and gender essentialism. The practice instills the idea that, despite the growing recognition of gender diversity, trans women are still inherently men and trans men are still inherently women, even after they transition. To some, this may seem trivial, but given popular culture's role in crafting, communicating, and teaching cultural standards to the public, in conjunction with the rampant use of biodeterministic views to prop up transphobic rhetoric, the effects of transface should not be overlooked.

Transface also has negative consequences for trans actors because it limits their employment opportunities. Trans performers are typically only considered for trans roles, yet they often lose these roles to cis actors because cis actors are purportedly more successful and commercially viable. This creates a "transface cycle," whereby trans actors are not cast because they are not as successful as their cis counterparts, but they cannot achieve success because they are not selected over cis people. Solidifying the transface cycle, cis actors frequently receive accolades and praise for taking on a trans role, as exemplified by the Oscar and Emmy awards given to cis actors for portraying trans characters in films and television series like *Dallas Buyers Club, The Danish Girl, Transparent, Boys Don't Cry,* and *The Crying Game*. Thus, transface promotes a cycle that subtly reenforces biodeterminism and a cis-only film and television industry; this cis industry, in turn, reproduces a cis gaze.

However, the cis gaze became more nuanced in the 2010s. While most works that feature trans characters still invest significant screen time in reductively explaining what it means to be trans to their audience, high-profile works are increasingly featuring trans storylines that are not defined by how trans people diverge from a cis norm. Instead, trans people exist in storylines where their transness becomes simply *another* distinguishing characteristic, rather than a wholly defining attribute. For example, the Netflix series *Sense8* featured the character of Nomi, who is better defined by her hacking skills than her transness. Similarly, *Supergirl* introduced a superhero, Dreamer, in its fourth season who happened to be trans, and *Billions* showcased a nonbinary character dominating the finance world. The best example is *Pose,* a TV series focusing on 1980s New York City ball culture. *Pose* contrasts with other representations because, instead of having one trans person represent the entirety of trans perspective, *Pose* features dozens of trans characters of color and depicts a multitude of differing attitudes, experiences, and opinions on a myriad of issues, gender related and not. Moreover, *Pose* often casts trans actors for these characters and has trans and queer writers and directors. *Pose*'s representation of the diversity found within trans communities makes a significant contribution and pushes popular media outlets to move beyond a reductive cis gaze.

Community-Driven Representation

Popular media outlets often fall back on reductive plot devices, such as the cis gaze, transition or oppression narratives, or the tropes discussed earlier. By contrast, community-driven media allow trans people of various intersectional social locations to cultivate their own image through the use of social media platforms. In many ways, the introduction of social media platforms has reshaped and pushed back against some of the reductive narratives and looking relations put forth by popular media outlets. Community-driven media, such as the content produced by and for trans people on YouTube and Instagram, have provided opportunities for trans people across the globe to explore the diversity of trans experiences. Importantly, these platforms also enable trans people to find others who share aspects of their identities and who have very different identities (such as race, disability, social class, sexuality, and education). Such a globally accessible way of disseminating diverse representation to trans people marks an important shift that does not flatten the complexities of trans identities or the multifaceted ways of being trans. While many people feel isolated or alone in their difference, community-driven media help their audience to celebrate and connect across difference and to cultivate self-acceptance. The cis gaze's division between us/them and its reductive narratives and tropes disseminated by popular media representations create a voyeuristic relationship between an assumed cis audience and the object of their gaze (trans people), which contributes to feelings of isolation among trans people. In contrast, community-driven media spark global interconnectivity across diverse experiences, turn shame into self-love, and dislodge both the cis gaze and the victim/villain dichotomy (i.e., rhetoric of deception) by simply portraying trans people as complexly human. Thus, community-driven media "look back" to radically reclaim a gaze through which trans images and narratives have been constructed.

Reproductive Health

The World Health Organization (WHO) defines reproductive health as a state of physical, emotional, mental, and social well-being in all functions and processes related to the reproductive system. Reproductive health is critical to general health, well-being, and quality of life for all people. Trans people, however, often lack access to culturally competent and age-appropriate reproductive health care due to a variety of reasons. These reasons include a lack of medical providers with adequate knowledge of trans people's reproductive health needs, discrimination from providers and staff, clinic structure (both clinic names and configurations intended to address the needs of cisgender people, e.g., "Women's Health Centers"), and electronic health records and forms that are not inclusive of diverse identities and bodies. The significant socioeconomic disparities observed in trans populations compared with cis populations pose additional barriers to competent care. These barriers are particularly problematic because trans people have unique reproductive health needs. This entry highlights important reproductive health considerations when caring for trans populations, with a particular focus on

trans adolescents and young adults (AYAs). We focus on four key domains of reproductive health: sexual experiences, satisfaction, and function; contraception and pregnancy prevention; fertility and family building; and HIV/sexually transmitted infection (STI) prevention.

Many, but not all, trans people experience gender dysphoria (i.e., distress stemming from incongruence between an individual's gender identity and their designated sex at birth) and/or body dysphoria that may be related to their reproductive anatomy (e.g., genitals) or common erogenous zones (e.g., chest/breasts). Discomfort or distress related to one's gender and body can interfere with a person's comfort or interest in pursuing romantic and/or sexual relationships. Furthermore, trans people may pursue medical and/or surgical interventions to reduce dysphoria, and these interventions can also directly affect sexual and reproductive health functions.

Medical and surgical interventions offered to trans people vary based on an individual's age, developmental stage, and treatment goals. For trans youth in the early stages of puberty, medications to suppress endogenous sex hormone production may be offered. Gonadotropin-releasing hormone (GnRH) analogs are sometimes referred to as "puberty blockers" and will suspend pubertal progression at the pubertal stage at which GnRH analogs are initiated by shutting down the hypothalamic-pituitary-gonadal axis. This will prevent the production of gonadal sex hormones (i.e., testosterone and estrogen). GnRH analogs are generally considered *reversible* and are intended to provide time for trans youth to mature and consider fully whether partially irreversible and irreversible medical and/or surgical treatments are aligned with their long-term treatment goals. Should GnRH analogs be discontinued, the hypothalamic-pituitary-gonadal axis will reactivate and endogenous puberty would progress.

For trans adolescents in the later stages of puberty or for trans adults, gender-affirming hormones (i.e., testosterone or estrogen) may be prescribed to induce desired secondary sex characteristics such as facial hair and voice deepening (mediated by testosterone) or breast development (mediated by estrogen). Gender-affirming hormone treatment is considered *partially irreversible*. Some of the physical changes are reversible (e.g., fat distribution), meaning that if gender-affirming hormones are discontinued, physical changes would revert to be more aligned with pretreatment physicality. Other physical changes, however, are irreversible (e.g., breast development; voice deepening), meaning that if gender-affirming hormones are discontinued, hormone-mediated changes would remain.

Most surgical interventions are offered only to trans adults and may involve removing undesired reproductive organs (e.g., ovaries/uterus; testicles) and/or creating desired genital anatomy (e.g., vaginoplasty; phalloplasty). Surgical interventions are *irreversible*. Each of these medical and surgical interventions for gender affirmation have implications for reproductive health, which will be further elaborated in the subsequent sections, as relevant.

Sexual Experiences, Satisfaction, and Function

Knowledge about sexual experiences, satisfaction, and function in trans people is limited, particularly among adolescents. Much of the existing research on trans adults has focused on the effects of gender-affirming medical and/or surgical treatment on different indicators of sexual behavior and functioning, including frequency of masturbation, frequency of sexual activity with a partner, ability to reach an orgasm, and subjective reports of sexual satisfaction. The goal of testosterone treatment for trans men is to increase testosterone levels to be in a range comparable with that of adult cis men and to suppress endogenous estrogen. Testosterone treatment typically promotes clitoral growth, reduces vaginal lubrication, and increases sexual desire. The goal of estrogen treatment for trans women is to achieve estrogen levels in a range comparable to premenopausal adult cis women and to suppress endogenous testosterone. Estrogen treatment typically reduces spontaneous and nocturnal erections, reduces or eliminates ejaculate volume, decreases testicular size, and may lower sexual desire.

Specific to surgical interventions, masculinizing genital surgery in trans men may include removal of the uterus and ovaries, as well as the creation of a neophallus by phalloplasty or metoidioplasty. For phalloplasty, a skin flap from another part of the body (e.g., forearm, thigh) is used to form the

contours of a penis. This results in a neophallus similar in size to that of a cis man but lacking erectile properties, yet allowing for erogenous sensitivity through the clitoris, which remains present behind the neophallus. There are also options available for erection support, including penile prosthesis. As an alternative to phalloplasty, metoidioplasty creates a penis using the testosterone-exposed enlarged clitoris and involves release of the clitoral ligaments. Compared to phalloplasty, metoidioplasty results in a smaller penis with maintained erectile properties and erotic sensitivity; however, full penetration is typically not possible due to the length of the neophallus. Feminizing genital surgery typically consists of removing the penis and testicles and creating a vagina, clitoris, and labia. The most common method for vaginoplasty is the penile inversion method, whereby the skin of the penis is inverted to form the vaginal wall. In order to maintain the neovagina, daily dilation, either through vaginal dilators or vaginal sex, is typically needed. Notably, GnRH analog treatment early in puberty, by inhibiting genital development, may limit the option of penile inversion vaginoplasty.

In general, trans adults report lower sexual satisfaction and higher sexual dissatisfaction compared with cis adults, and research generally suggests that sexual satisfaction increases in the majority of trans men and women following gender-affirming medical/surgical treatments. Furthermore, gender-affirming surgery is also usually associated with increased sexual activity. Increases in sexual activity and sexual satisfaction are thought to be related to improved body image and body satisfaction following gender-affirming medical/surgical interventions.

Little attention has been paid to the sexual experiences of trans adolescents, with discrepant findings by cultural context. Data from the U.S. 2017 Youth Risk Behavior Survey highlights differences in sexual experiences between trans and cis adolescents. Trans adolescents were more likely to report experiencing first sexual intercourse before the age of 13 years and having sexual intercourse with four or more partners in their lifetime compared with cis adolescents. Trans adolescents also were more likely than cis adolescents to endorse using no contraception and using alcohol or drugs the last time they engaged in sexual intercourse. Trans adolescents in the Netherlands, however, were less sexually and romantically experienced than their cis peers. However, 77% had fallen in love, 50% had experienced a romantic relationship, 26% had experienced petting while undressed, and 5% had experienced sexual intercourse.

Contraception and Pregnancy Prevention

Contraception and other prevention strategies should be offered to all transmasculine people who have the potential to become pregnant and who wish to prevent pregnancy. In order to accurately assess an individual's contraceptive needs, health care providers must conduct a gender-affirming sexual health history that does not make assumptions about a person's internal organs, sexual partner(s), sexual behaviors, desires related to pregnancy/family planning, and knowledge of contraception. Few medical providers have sufficient education and training in trans health care and therefore may not feel comfortable addressing the reproductive health needs of trans people.

Research suggests that both trans people and medical providers may entertain misconceptions about transmasculine people's risk of pregnancy while using testosterone. Premenopausal transmasculine people with intact reproductive organs, including those whose menses are suppressed by testosterone, may experience pregnancy. Although exogenous testosterone is thought to impair ovulation, it does not do so absolutely; thus, spontaneous ovulation may occur. Several studies have documented unintentional pregnancies and abortions in transmasculine people, even in those who were using testosterone consistently and experiencing menstrual suppression. In some cases, trans people have reported that a medical professional counseled them that they could not become pregnant while using testosterone.

Concerns about potential interactions between testosterone and contraceptives may also contribute to underutilization of contraception by transmasculine people. Testosterone is not a contraindication to any form of contraception, even those containing estrogen; therefore, people should be counseled on all available forms of contraception. While research has not examined concurrent use of testosterone and combined hormonal contraceptives (CHCs), which contain estrogen and a progestin, it is unlikely

that using CHCs results in significant feminization for postpubertal people. Trans people who wish to avoid estrogen can be offered progestin-only contraceptives, and those who wish to avoid hormones altogether may use options such as condoms, the copper intrauterine device (IUD), and tubal ligation. Those who experience gender dysphoria related to their genitals may prefer to avoid an IUD or opt to undergo insertion under sedation.

Counseling regarding each option should include a review of its efficacy, hormonal composition (if any), route of administration, reversibility, and side effect profile. Particular attention should be given to side effects such as expected changes in bleeding patterns and chest tenderness. The likelihood of experiencing noncontraceptive benefits of contraception, such as reduction of menstrual bleeding or improvement in painful menses, should also be highlighted. Ultimately, accurate counseling promotes informed consent and shared decision making and enables trans people to identify an option least likely to trigger gender dysphoria and most likely to meet their contraceptive needs.

Fertility and Family Building

Studies have shown that the majority of trans adults desire to be parents, with about half specifically desiring genetically related children and about a third indicating that they would have accessed fertility preservation (FP) methods if these options were offered. There is more variability reported in the limited studies exploring parenting desires among trans youth accessing gender-affirming medical treatment in adolescence. Among trans adolescents, a quarter to a third express desires to have their own genetically related children, and a similar proportion express uncertainty about biological parenthood desires or recognize that their parenting intentions may change over time. The current standards of care recommend fertility counseling prior to any treatments for gender affirmation that can impair fertility. Gender-affirming surgeries that remove the ovaries/uterus or testicles cause permanent sterility. The literature is less clear regarding the effects of GnRH analogs and gender-affirming hormones on fertility. The consensus, however, is that these hormonal treatments are likely to impair fertility, at least while an individual is actively on treatment.

GnRH analogs are thought to suspend pubertal development without any long-term impairment to fertility. Pubertal development, however, is necessary for sperm production in those designated male at birth and for egg maturation in those designated female at birth. It is typically not until the later stages of pubertal development that mature eggs and sperm are present. Thus, trans youth prescribed GnRH analogs in the early stages of puberty, as recommended by the current standards of care, will not have mature gametes (i.e., eggs or sperm) at the time of GnRH analog treatment initiation. This is important, since most trans youth do not discontinue GnRH analogs before commencing testosterone or estrogen. Currently, there are no empirical data examining the long-term fertility outcomes in trans individuals treated with GnRH analogs in early puberty and initiating gender-affirming hormones without or before discontinuing GnRH analogs. We do not know whether fertility can be gained, either naturally or with assisted reproductive technologies, in this population.

Regarding the long-term effects of gender-affirming estrogen on testicular function and fertility, there has been little research specific to trans communities. Studies of estrogen-secreting tumors in cis men show that sperm production is possible after tumor removal even after months to years of abnormal hormone function. Studies of high-dose estrogen to treat prostate disease in cis men, however, document associations with azoospermia (i.e., lack of sperm in semen) and testicular atrophy, with variable reversibility. The limited studies of gender-affirming estrogen treatment in trans women also demonstrate variable impairment related to sperm production. Thus, it is unclear the extent to which loss of sperm production is dependent on estrogen dose or duration of estrogen exposure.

The long-term effects of testosterone on ovarian function and fertility are also considered unknown at this time. As mentioned earlier, there are numerous reported cases of trans men experiencing unplanned pregnancy when testosterone therapy, despite ceasing menses, did not suppress ovulation. Menstruation also typically returns within 1 to 2 months of testosterone cessation, suggesting that any impairment to fertility may be temporary or restricted to when an individual is actively on treatment. Notably, research examining ovarian tissue at the time of gender-affirming surgery reports

mixed results with regard to testosterone's effects on ovarian morphology. Some studies report a definitive adverse effect of testosterone on ovarian histology (i.e., a polycystic ovarian morphology), whereas other studies conclude there is minimal to no adverse effect of testosterone on the ovaries.

Given the uncertainty of fertility impairment associated with pubertal suppression and gender-affirming hormones and known sterility associated with certain gender-affirming surgical procedures, fertility counseling is recommended to include a discussion of FP methods. A range of FP methods are available to trans individuals depending on designated sex at birth and pubertal development. In postpubertal individuals, gamete cryopreservation is the standard FP method. In designated males at birth, sperm cryopreservation is considered a safe, established, and cost-effective FP method. While noninvasive retrieval methods are preferred (i.e., masturbation), sperm also may be retrieved surgically. In designated females at birth, egg retrieval requires 2 weeks of daily hormone injections to stimulate follicular development, monitoring via transvaginal or abdominal ultrasounds, and transvaginal oocyte collection conducted under conscious sedation. For postpubertal trans individuals, embryo cryopreservation also is considered an established FP method. Embryo cryopreservation requires a gamete (i.e., sperm or egg) from the target patient and a corresponding gamete (i.e., egg or sperm, respectively) from a partner or donor.

Mature gametes are not usually present before mid to late puberty. In cases in which FP may be desired before gamete maturation or when gamete maturation is not expected due to GnRH analog treatment in early puberty followed by gender-affirming hormone treatment, cryopreservation of immature gonadal tissue may be considered an experimental FP method. Immature germ cells can be collected via gonadal tissue biopsy and cryopreserved with the hope that this tissue may be used in the future as a source of mature gametes with advances in in vitro maturation technology. Immature gonadal tissue cryopreservation with in vitro maturation has demonstrated some success in animal models but has yet to be proven in humans. As such, patients considering experimental immature gonadal tissue cryopreservation should be counseled accordingly.

It is notable that among postpubertal trans AYAs in the United States who are offered gamete cryopreservation prior to gender-affirming hormone therapy, only a very small number—less than 5%—complete FP. It is also important to note that individual desires to have genetically related children is not the only consideration in FP decision making. A number of qualitative studies and case reports have identified barriers to FP related to risks of worsening gender dysphoria to pursue gamete cryopreservation, costs of retrieval and storage, and preference not to delay gender-affirming hormone treatment initiation.

HIV/STI Prevention

While sexual behaviors should not be viewed solely through the lens of infection risk, access to HIV/STI counseling, screening, prevention, and treatment services are elements of reproductive health that are critical to keeping bodies safe and free from infection and associated disease. Despite decades of HIV research, relatively little is known about HIV and trans women, and even less is known about trans men, since trans people have not been visible in national HIV research since the beginning of the epidemic. Studying the impact of HIV/STIs on trans people and developing specific strategies for prevention, treatment, and engagement in care for this population are critical to addressing health disparities and should be urgently prioritized in future research.

Trans women experience alarmingly high rates of HIV, with global prevalence estimated to be 19.1%, nearly 49 times higher than that of the general population. Although data on prevalence of STIs (e.g., chlamydia, gonorrhea, syphilis) vary widely between studies, rates are generally high. One large 2018 meta-analysis conducted by the Centers for Disease Control and Prevention (CDC) estimated HIV prevalence in trans women living in the United States to be 14.1%, with trans women of color disproportionately affected (i.e., 44% of African American and 26% of Latina trans women are living with HIV compared to 7% of white trans women). Additionally, growing research suggests that trans men living in the United States may experience higher rates of HIV compared with the general population, with the CDC estimating prevalence of 3.2%.

Elevated risk for HIV/STIs among trans people, particularly trans women, is presumed to be related to numerous, intertwined factors. Transphobia and discrimination foster economic and social marginalization through alienation from families and peers, disruption of educational and employment opportunities, and exclusion from community connections and legal protections. This often leads to poverty, unstable housing, trauma and victimization, incarceration, participation in sex work, substance use, and mental health problems. On an individual level, trans women who have sex with men are more likely to have receptive anal intercourse and may be less able to negotiate condom use. More research is needed to understand the risk of acquiring HIV/STIs in trans women who have undergone vaginoplasty and have vaginal sex. Trans men using testosterone are at higher risk of acquiring HIV/STIs due to atrophic vaginal tissue susceptible to abrasions during vaginal sex.

Trans people living with HIV are less likely to be aware of their diagnosis and less likely to be virally suppressed than cis people living with HIV. When asked about health concerns, trans people often prioritize gender-related health over HIV care. Offering comprehensive care may be an effective strategy to retain and engage patients in HIV care and, through "treatment as prevention," reduce HIV transmission. Trans people may have concerns about side effects of antiretroviral treatment (ART) and interactions with gender-affirming hormones. To date, research informing understanding of interactions of feminizing hormone treatment with ART has been extracted from research of cis women using estrogen-containing contraception. These suggest that while drug–drug interactions do exist with some medications, several preferred HIV treatment regimens do not interact with gender-affirming hormones.

Trans people should have access to all HIV prevention strategies and to other critical health services. Low rates of health care engagement not only pose challenges to identifying HIV/STI diagnoses but also compromise access to education about prevention strategies, such as condom use, HIV preexposure prophylaxis (PrEP), postexposure prophylaxis (PEP), and safer-sex strategies. Condoms, when used both correctly and consistently, reduce HIV/STI transmission. PrEP is a daily medication that is highly effective at preventing HIV acquisition, when taken as prescribed. Although no dedicated studies have demonstrated efficacy of PrEP in trans populations, trans people using PrEP consistently should be just as likely to receive benefit; however, adherence may be compromised by the myriad of socioeconomic factors described earlier. To date, low uptake of PrEP by trans women is attributed to factors such as lack of trans-inclusive marketing, lack of insurance and cost, and concerns about side effects and interactions with feminizing hormone treatment. PEP refers to medical treatment aimed at reducing HIV acquisition following a recent exposure to HIV. Safer-sex practices for both trans and cis people include routine HIV/STI testing, limiting one's number of sex partners, avoiding condomless anal and vaginal sex, and avoiding intravenous drug use. Finally, in addition to timely HIV/STI screening and treatment, trans people should have access to preventive services, including routine examinations, human papillomavirus vaccination, and age-appropriate cancer screening.

Reproductive Health Counseling

Rapport and trust are essential to facilitating open and honest patient–provider dialogue on any health topic, particularly those that involve sexual and reproductive health. Addressing patients by their chosen names and pronouns, asking about preferred language for body parts, understanding the sensitive nature of physical exams, and appreciating that discussions around aspects of health such as menses may provoke distress are critical. Rather than adopting a cis-heteronormative approach, providers should avoid making assumptions about sexual orientation, sexual behaviors, and gender identity and anatomy of partners, particularly as research confirms that trans people (like cis people) espouse a wide diversity of sexual orientation and behaviors. Respectful dialogue occurring in a clinical setting that welcomes trans people sets the groundwork for accurate education about sexual experiences, satisfaction, and function; contraception and pregnancy prevention; fertility and family building; and HIV/STI prevention.

Research, Questions About Gender Identity

Survey research is important in advancing our knowledge about the size, characteristics, experiences, and needs of the gender minority population, such as transgender (trans) people. One of the main methods for learning about the U.S. population is by nationally representative federal surveys, like the decennial census. Such surveys provide demographic, health, economic, and other key indicators for the United States, which are valuable in assessing public policy and resource needs of the population. Yet, few federal surveys ask questions to identify gender minority respondents.

Surveys typically ask a binary sex question to assess whether the respondent is male or female. This approach does not allow gender minorities to be identified as such. Federal surveys that do collect data about gender minorities do so using different approaches to measuring gender identity. These approaches continue to be tested and refined to identify gender minorities, especially as gender identity labels evolve over time.

Approaches to Gender Identity Measurement

In 2014, the Gender Identity in U.S. Surveillance Group (GenIUSS Group) published a guide to best practices for identifying trans people in surveys of the general population. The GenIUSS Group outlined two main approaches for measuring gender identity that have been adopted by some federal surveys, such as the Bureau of Justice Statistics' National Crime Victimization Survey (NCVS) and the Centers for Disease Control and Prevention's (CDC's) Behavior Risk Factor Surveillance System (BRFSS). The two approaches recommended by the GenIUSS group were developed over the preceding years and originated in community-based research efforts and in public health research efforts. The

first approach is a two-item measure to identify respondents whose gender identity differs from the sex they were assigned at birth. The second approach is a single-item measure to identify respondents who consider themselves to be transgender.

The two-item measure first asks respondents what sex they were assigned at birth, on their original birth certificate. Respondents select male or female in response to this question. The second item asks how respondents describe themselves: male, female, transgender, or another gender. These two items are then compared to identify those whose sex assigned at birth matches their gender identity (i.e., a cisgender person) and those whose gender identity differs from their sex assigned at birth (i.e., a gender minority person). The two-item measure was developed in the late 1990s by a Philadelphia-based advocacy organization, the Transgender Health Advocacy Coalition, for use in community-based research. The two-item measure was subsequently refined and used in transgender health needs assessments, led by Jessica Xavier, in Washington, D.C., and Virginia, and now appears on some state and federal surveys, such as the California Health Interview Survey (CHIS) and the NCVS.

The single-item measure to identify trans individuals asks survey respondents if they consider themselves to be transgender, with *yes* or *no* response options. A definition of the term *transgender* is provided either as part of the question or if respondents assert that they do not know the meaning of the word. This single-item measure is used in the CDC's BRFSS as part of an optional module states can add to their questionnaires. The definition of the term *transgender* provided in the BRFSS questionnaire optional module is as follows:

> Some people describe themselves as transgender when they experience a different gender identity from their sex at birth. For example, a person born into a male body, but who feels female or lives as a woman would be transgender. Some transgender people change their physical appearance so that it matches their internal gender identity. Some transgender people take hormones and some have surgery. A transgender person may be of any sexual orientation—straight, gay, lesbian, or bisexual.

This definition is only read by the interviewer to the respondent if the respondent has any question as to what the term *transgender* means.

The single-item measure was first developed in 2001 by trans community leaders and allied researchers in Boston and was incorporated into the Massachusetts BRFSS questionnaire in 2007. The CDC began offering the single-item measure for states to add to their BRFSS questionnaires in 2014. The CDC's BRFSS also added a follow-up question to the single-item measure, for use if a respondent replies yes, that they do consider themselves to be transgender. The follow-up question asks if the respondent considers themselves to be male-to-female, female-to-male, or gender nonconforming.

Considerations in Designing Gender Identity Measures

In designing questions to identify gender minorities in surveys, it is important to first consider who the survey respondents will be. For instance, will the survey respondents be a sample of the general population (i.e., a population-based survey) or a survey of a specific group or community (e.g., a survey of LGBTQIA+ people in a specific state)? If the survey is conducted of the general population, one must consider how to ask questions about gender identity that will be understood by both cis (i.e., non-trans) and gender minority people alike. Gender minority people comprise a small percentage of the general population. Therefore, if only a small percentage of cis respondents are confused by the questions and accidentally identify themselves as gender minorities, the resulting data about gender minorities would be "flooded" with respondents who do not belong in that category. This could obscure findings about gender minorities that are vital for public health, public policy, or other endeavors. In surveys of a specific group or community, questions can be tailored in a way that best meets the research needs for that group or community. For instance, more specific or regional gender identity terms could be used. It is also important to consider whether survey respondents will be adults, youth, or both. Questions for adults may not be appropriate for youth, depending on the ages of the respondents.

Another consideration when designing questions to identify gender minorities is that of shifting

terminology in gender identity labels. Oftentimes, surveys are designed to be repeated year after year. For instance, the CHIS is repeated in 2-year cycles. Questions about gender identity should use terminology that is not likely to soon fall out of common use. For example, the term *transsexual* was commonly used to describe those who have undergone, or desire to undergo, gender-affirming medical treatments, but that term is now considered taboo by many, and the term *transgender* is preferred. Similarly, the term *gender variant* was commonly used in the late 1990s and early 2000s but is no longer commonly used. Therefore, questions should be designed so that they will remain appropriate and relevant over time.

Finally, questions to identify intersex individuals should be given separate consideration from questions to identify gender minorities. Often, when reviewing and revising gender identity questions such as the ones described above, reviewers request the term *intersex* be listed as an answer option for sex assigned at birth or as a current gender identity label. However, intersex is not a sex that is assigned at birth, and *intersex* is not commonly used as a gender identity label among those who have physical intersex characteristics. Questions to identify intersex individuals have been developed, and revision and refinement of these questions continue.

Considerations in Administering Gender Identity Questions

How questions about gender identity are asked may affect the quality of the resulting data. Where in the survey the questions are placed, whether the survey is administered by an interviewer or self-administered, whether the survey is completed on paper versus a computer, and whether the questions are answered by the respondent themselves or by someone else on behalf of another person (i.e., proxy reporting) are important considerations for data quality. Gender identity questions are ideally included as part of the demographics section of a survey. Population-based surveys have sometimes included questions about gender identity and sexual orientation with questions about sexual risk behaviors. The BRFSS has included these questions in a separate optional module.

Surveys that are self-administered rather than administered by an interviewer may result in respondents being more willing to disclose a gender minority identity. Interviewer-administered surveys can take place over the phone or in person. In either case, a respondent may feel uncomfortable disclosing a gender minority identity to an interviewer. Whenever possible, gender identity questions should be self-administered.

Furthermore, surveys that are conducted via computer may limit participation by those who do not have access to computers or Internet service, which may skew the survey sample. Gender minority individuals are more likely to be low income or living in poverty, which may lessen participation in surveys administered via computer. Considerations should be made to improve access to surveys administered via computer, such as administering paper surveys for those without computer access.

Some surveys use proxy reporting. For instance, the American Community Survey asks one household member to respond to the survey on behalf of all members of the household. Having one individual report on the gender identity of another individual may affect the accuracy of the resulting data, particularly if the proxy reporter is unaware of their household member's gender identity. In 2015, the U.S. Office of Management and Budget (OMB) established the Federal Interagency Working Group for Improving Measurement of Sexual Orientation and Gender Identity in Federal Surveys to study issues surrounding the inclusion of gender identity measures in federal surveys, including the issue of proxy reporting. The working group includes over 100 representatives across 35 federal agencies. The working group continues to study the measurement of gender identity in surveys that use proxy reporting and has published several reports of their findings.

Gender Identity Survey Research With Representative and Nonrepresentative Samples

To better understand the characteristics and experiences of the U.S. gender minority population, it is vitally important to add questions to identify gender minority respondents in federally administered surveys, such as the American Community Survey and the Current Population Survey. Surveys such as these would expand knowledge of the demographics, size, experiences, and well-being of the

gender minority population in the United States. Yet, these surveys would provide only a part of the true picture of the lived experiences of gender minorities. To create a fuller understanding, community-based surveys and research that is tailored to the needs and experiences of the gender minority population are needed.

Surveys that are tailored for gender minorities, such as the 2015 U.S. Transgender Survey (USTS), conducted by the National Center for Transgender Equality, can ask questions not covered in federal surveys. Questions about experiences with discrimination, family rejection, access to gender-affirming health care, gender affirmation milestones, and other topics give valuable information about the experiences of gender minorities that has implications for public health, public policy, and other fields. Research that centralizes gender minority respondents can complement findings from federal surveys to describe the needs of this population and target resources and interventions to improve well-being. More and more federal surveys are adding gender identity questions, yet the vast majority do not include these questions. While federal gender identity data collection slowly expands, community-based research and research that centralizes gender minority people provide most of the relevant data and remain vital sources for understanding the characteristics and needs of this population.

Research, Recruitment and Sampling

Participant recruitment, or the identification, invitation, and selection of individuals to participate in research, is often viewed as one of the most challenging but essential steps in conducting research. Research with trans individuals, communities, and populations presents some unique considerations and challenges for effective recruitment and sampling, as discussed in this entry. A brief historical overview is followed by an examination of principles and recommended practices in research with trans people and communities, and the entry concludes with a description of the key recruitment and sampling strategies used by today's researchers.

Historically, research with trans populations has typically employed a variety of nonprobability sampling methods and approaches. With earlier academic scholarship being authored predominantly by cisgender (cis) medical professionals who interacted with trans individuals seeking out medical interventions for gender transition (e.g., hormones, surgery), it is unsurprising that most of these early works recruited individuals from clinical settings. Gender clinics that opened in the United States and Canada became the epicenter for much of trans medicine research

being published from the 1960s to 1980s. For numerous medical and sociocultural reasons, much of this research disproportionately focused on the experiences of individuals assigned male at birth. As a result, clinical research with trans individuals has historically rendered invisible the experiences of trans men and gender nonbinary individuals.

As scholars from other, nonmedical fields became increasingly interested in trans experiences, health, and well-being, research expanded from gender clinic samples to community settings. As a result, research questions have also expanded greatly and become increasingly complex as the larger body of literature has grown; this has necessitated a corresponding shift in sampling and recruitment strategies.

Methods, Considerations, and Challenges of Recruitment and Sampling

Participant recruitment involves a number of specific, sequential steps: (1) selecting eligibility criteria based on study aims; (2) identifying the eligible population of interest; (3) recruiting an adequate, representative sample; (4) providing accurate information about the study and its aims; (5) obtaining true informed consent; (6) retaining participants until study completion; and (7) minimizing costs to the individuals and community and maximizing benefits. As with any defined population, particularly one that experiences stigma, marginalization, and institutional invisibility, there are a number of challenges and considerations related to recruitment and sampling when conducting research with trans individuals, communities, and populations. These can be conceptualized *as practical/logistical* and *cultural and relational,* as discussed below.

Practical and Logistical

Practical and logistical challenges and considerations stem in part from the relative institutional invisibility of trans individuals in U.S. society and the consequent lack of information regarding key population characteristics. To date, large population-based surveys have typically assessed gender identity through a single question that often provides only two dichotomous sex category options ("male" and "female"). Some research has moved to incorporate additional category options of "transgender" and "other" in the same question, but research has shown that this leads to appreciably higher levels of missing data among trans individuals. Instead, researchers have recommended assessing gender with two questions: sex assigned at birth and gender identity. As a result, without consistent and accurate assessment and reporting of gender identity across general population studies, trans population characteristics, including size, remain largely unknown. Thus, challenges remain to evaluating the effectiveness of study methods for recruiting an adequate, representative sample when key characteristics of the larger population are unknown. Population estimates published by the Williams Institute in 2016 from numerous state-based health surveys have estimated the size of the U.S. population of trans adults to be 1.4 million people, or approximately 0.6% of the entire U.S. population. Because population-based surveys ask specifically about gender identity—and provide a more expansive set of gender identity options for respondents—knowledge of U.S. trans populations will presumably continue to grow. In turn, researchers will be able to tailor sampling and recruitment methods to more effectively reach the communities and populations of interest.

Some of the financial considerations for participant recruitment and sampling relate to the cost of recruitment materials, participant compensation, and the hiring of research study staff and/or research assistants. Recruitment materials may include the design and distribution of recruitment flyers that can be distributed either in person or online via email or on posts to Internet forums. Some researchers construct websites where prospective participants and community members are able to learn more about the study's aims and the composition of the research team. This increases the visibility and transparency of researchers within the community and can also provide a way for community members to interact directly with researchers. Furthermore, researchers can use their website as a dissemination tool for giving knowledge back to the community regarding completed research studies. This, in turn, can be a powerful recruitment strategy over time, with prospective participants being able to assess the meaningfulness of the research they are participating in, whether personally or to trans communities generally.

Research with trans communities may also require additional personnel beyond the time that study investigators are able to allot to a single study. When considering personnel decisions, investigators may find themselves choosing between hiring a graduate research assistant (GRA) or a community member into the role of paid study staff. Although GRAs often arrive to such roles having already received formal training in research methods and design, the financial cost of hiring a GRA may be higher due to the addition of tuition and benefits on top of salary support, a common institutional policy in graduate colleges across the United States. Moreover, while a GRA may be able to assist with the more technical aspects of the study's methods and with data analysis and manuscript preparation as a result of formal research methods training, a hired community member may be able to assist in ways that are invaluable to recruitment and sampling, among other research activities. For example, a research team that hires a community member who is already connected to key organizations and community leaders may establish credibility more readily within that community. Furthermore, if research team dynamics and structures are carefully attended to, with all members being able and invited to contribute to team decision making, a hired community staff member may provide invaluable feedback regarding the study's recruitment materials and approaches, heading off serious problems before they can emerge and/or increasing effectiveness in the strategy from the start. Thus, researchers should carefully weigh their needs when hiring research staff for a study, considering not only the primary aims of the study but also any secondary ones as well.

Cultural and Relational

Research recruitment and sampling decisions should also include relational and cultural considerations for the communities in which the research is taking place. Relational and cultural factors to consider could include not only the current relationship of researchers with trans communities but also historical relationships between researchers and community members as well as the larger historical context of trans–community relations. For communities where there may be a stronger awareness of gender-based trauma, particularly at the hands of academicians (e.g., a history of harmful clinical gatekeeping practices and/or conducting anti-trans research), researchers should tailor their approach to recruitment in light of this history. Some community reconciliation efforts may be warranted and can go a long way toward changing the dynamics between researchers and community members for ongoing research efforts. Furthermore, with the recent wave of anti-trans laws and policies being introduced in state governments across the United States, some communities may be understandably wary of participating in research out of concerns for safety and without assurance of research aims as being beneficial to trans communities.

To date, in online survey-based research with trans populations, samples have demonstrated more limited racial and ethnic diversity, with the majority of published research samples being disproportionately white. This has had the effect of rendering trans people of color (POC) invisible within the larger scholarship on trans concerns. Moreover, when stigma and health outcomes have been evaluated with data disaggregated by race, it is clear that trans POC experience far higher rates of prejudice, discrimination, violence, and adverse mental and physical health outcomes as a result of compounding effects of intersectional marginalization and oppression. In-person recruitment efforts that have occurred within defined and often urban communities (e.g., San Francisco, New York City) have tended to be more racially and ethnically diverse than those conducted online. Typically, sampling methods in these studies have involved researchers spending time in and recruiting directly from community settings. Notably, many of these same studies used community-based participatory research methods, which involved forming a research advisory board with members of the community who were integral to recruitment efforts and research design. Moreover, researchers who are active contributors to community life have been able to gain credibility and trust.

Contemporary Recruitment and Sampling Strategies

Convenience sampling methods with trans populations have included Internet-based participant

recruitment, in-person community recruitment through community health services, and respondent-driven sampling (RDS). Internet-based participant recruitment has involved researchers posting information about their study to email listservs, social media groups (e.g., Facebook), and other Internet forums and platforms (e.g., Reddit). These posts often include a link to the online survey platform where participants are able to complete the survey from their own home. This method allows researchers to collect data inexpensively and has been used effectively with other hard-to-reach populations who form large networks of online social communities. However, Internet-based convenience sampling is limited to those who have access to the Internet via a computer or smartphone and have the time and physical ability to complete the survey. Limited distribution of recruitment posts also increases sampling bias. Finally, scholars such as Luke Gelinas and colleagues have noted a number of ethical considerations related to social media recruitment that researchers should be aware of.

In-person community recruitment strategies are able to address some of the barriers to effective recruitment with Internet-based sampling, such as reaching members of the population who may not have access to the Internet and who may have a different ability status for completing an online survey. However, in-person recruitment can be costly, particularly in personnel time. Recruitment is also limited to that geographic location, which may affect the generalizability of study findings depending on study aims and scope.

Another convenience sampling method that addresses some of the limitations of each of the above methods is respondent-driven sampling (RDS). RDS is a method similar to snowball sampling where one participant passes along information about the study to other prospective participants. However, in RDS, referrals to the study are tracked and recruitment "trees" are carefully logged. RDS begins with a small number of "seed" participants who complete the research study activities. RDS is then initiated when participants give a limited number of referral coupons to other eligible individuals in the sample population. Individuals receiving a referral coupon who are interested in participating contact the research team to complete the study activities, then receive referral coupons themselves to pass along. In this way, recruitment trees grow as referrals succeed. Each referral coupon includes information about the study and a unique referral code in order to track referee–referral connections and compensate the referring participant for each coupon returned by a new participant. Typically, participants are compensated a certain amount for participation in the study and a different, often lower amount per successful referral. This method has some distinct advantages over other recruitment strategies: First, initial participants are able to vouch for the study to others, which can help dispel some concerns some community members might have about the research. Second, because referral coupons are carefully tracked, sampling bias can be statistically estimated. Despite these advantages, RDS can also be slower than other methods of sampling, and when referrals are unsuccessful, changes to the RDS protocol (e.g., increasing the number of referral coupons, adding new seeds) may have to be implemented in order to keep recruitment moving forward. RDS has been used successfully in a number of trans populations and communities around the world.

In sum, although trans populations are considered hard to reach, with recent methodological and technological advancements, researchers have greater means at their disposal to connect with trans populations. By carefully and critically attending to the various considerations outlined above, researchers can conduct meaningful and scientifically rigorous research with trans individuals and communities.

Resiliency

Trans people, in the face of gender minority stress, demonstrate remarkable *resiliency:* a constellation of individual factors, health behaviors, and social and community support that buffers the adverse impact of discrimination. Because of its central role in promoting trans health and wellness, resiliency has become a key construct through which scholars, activists, and practitioners conceptualize minority stress. It is often discussed as manifesting in two related ways: (1) at the *individual level,* whereby individual trans people develop personal agency, make meaning, and gain control in times of distress, and (2) at the *community level,* whereby trans people bounce back from adversity by embracing trans-affirming norms and values, finding role models, and receiving trans-specific community resources and care. Trans resiliency is also *intersectional,* in that trans people with multiple marginalized identities demonstrate unique factors, health behaviors, and community resources to bounce back from unique manifestations of marginalization. Providers working with trans communities are encouraged to collaborate with clients to buffer individual and community resiliency.

Trans Resiliency in Context

Psychological research has demonstrated across all groups that individuals who experience trauma or stress, even in their earliest years, develop creative and often lifesaving strategies to survive, make meaning, and thrive. Among diverse trans communities, resiliency is a key process by which individuals bounce back from chronic exposure to transphobia.

Trans Minority Stress

Trans resiliency is thus best understood in the context in which trans people live: an often-hostile culture of transphobia, as well as a time of social, legal, and cultural shifts in which trans communities are gaining visibility and collective organizing power. Given the systems in place that tend to marginalize trans people, it is important to examine resiliency within the context of minority stress. Minority stress (or *gender minority stress*) is a construct first explored empirically by Ilan Meyer, who explained processes by which sexual minority individuals have for decades reported disproportionately high levels of distress, adverse health outcomes, and sexual and behavioral risk. The concept of minority stress posits that minority individuals, in addition to contending with the typical stressors inherent in daily life, must also contend with the psychological impact of stigma and discrimination. The minority stress model describes two related ways stressors may occur in a minority person's life. First, minority individuals

experience *distal,* or external, stressors in their environment. Second, distal stressors may lead to *proximal,* or internal, stressors that occur within a person's internal experience. Distal and proximal stressors are connected, in that they bidirectionally affect each other *and* simultaneously affect adverse psychological and physical health outcomes.

Many studies demonstrate how these processes may occur for trans people. Examples of distal stressors are explicit experiences of violence, harassment, and rejection in relation to one's gender identity, as well as more subtle stressors such as the experience of nonaffirmation as a result of being misgendered (i.e., being referred to with gendered language that does not match one's gender identity), having to reveal one's sex assigned at birth while completing paperwork, or witnessing the erasure of trans identities in everyday life. Some examples of proximal stressors may include internalized transphobia (i.e., acceptance of negative beliefs about one's gender identity or trans people generally), negative expectations for interpersonal interactions and relationships, and the process of concealing one's trans identity by either conforming one's gender expression to their sex assigned at birth or living in "stealth" (i.e., hiding one's trans identity after medically transitioning enough to "pass" as cisgender). Each of these stressors has been shown to have direct and indirect associations with adverse health outcomes, including depression, anxiety, and suicidal ideation. Resiliency, on the other hand, has been shown to moderate, or decrease, the relationship between anti-trans discrimination and adverse health outcomes.

Trans Minority Strengths

Indeed, stress is not the only aspect of trans people's lives. Minority stress occurs in chronic, often insidious ways, yet trans people have also demonstrated creative, even heroic resiliency. How do trans people and communities build resiliency, even in the face of such a toxic culture? The relationship between stress and resiliency is often understood as a balancing act.

According to the foundations of stress theory within psychological research, the consequences of stressful events on a person's health are determined by the countervailing impact of two processes: (1) *pathogenic stress processes,* or factors and experiences that decrease health, and (2) *salutogenic coping processes,* or factors and experiences that increase health. Stress theory posits that the impact of stress is countervailed, or offset, by a person's ability to cope; as such, resiliency is a key protective mechanism in minority people's lives. An example of a pathogenic stress process in a trans person's life may be the shame or anger that a nonbinary person feels after being outed to a transphobic coworker. A salutogenic coping process may be that person's trans pride, or their decision to reach out to others to ask about employment opportunities in a trans-affirming workplace. These salutogenic coping processes are examples of trans resiliency. Given the ways trans people have experienced oppression, yet continue to build hope and connection, resiliency has become a core aspect of the ways that scholars and practitioners understand diverse trans communities' abilities to countervail gender minority stress.

Individual-Level Resiliency

Resiliency occurs at both individual and community levels for trans people. Individual trans resiliency is defined as person-specific factors that improve health outcomes and buffer minority stress. Recent studies have identified strategies commonly used by trans people to bolster individual resiliency. These factors tend to describe internal processes, such as how a person relates to their gender, society, and themselves as a gendered person in the world. Much of the foundational research on individual-level resiliency was led by Anneliese Singh, who conducted groundbreaking qualitative studies capturing themes of individual-level resiliency among trans people and, more specifically, trans people of color.

Individual-level recommendations are greatly important for the development of resiliency among trans people. The first and often most emphasized technique is the ability to self-define and conceptualize one's gender. The ability to understand and define one's own gender identity and gender expression can be both liberating and grounding for a trans individual. Because gender identity can be fluid in nature, it is important that the individual uses their own words and concepts to self-define, developing a skill that may be necessary for the rest

of their life. This is not a strategy that should be performed in isolation in order to build resiliency, as Singh notes, but rather, involving others can be vitally important for self-definition. Having a supportive space for open conversation, such as a counseling center, a likeminded community, or among one's family, can be extremely helpful for developing definitions and exploring specific words that can accurately depict the person's gender. As well, other strategies for developing a gender definition include journaling, acting, and activism.

Another individual-level recommendation that trans people have often noted in strengthening their resiliency is the reframing of techniques used to mitigate other challenges, such as mental disorders and racism. As discussed earlier, many trans people have multiple minority identities for which they must develop protective factors. Research has found that trans people often reframe resiliency techniques developed for their other identities so as to build resiliency in their identity as a trans person. These processes may include navigating hostile environments and defining their own gender. Cultivating an awareness of oppression is another possible individual resiliency strategy. Finally, going through social, legal, or medical transition has been shown to increase positive health outcomes for trans people. Although many trans people do not need or wish to pursue medical transition, studies have demonstrated that transitioning may increase resilience and protect from adverse health outcomes, including suicidal ideation and attempts, gender dysphoria, low self-esteem, and body image concerns.

Group-Level Resiliency

Individual-level factors differ from group-level factors, which tend to be external in nature and involve behavior and interactions with other people, events, and the ecosystems in which trans people live. Looking outside of the self, many strategies for developing resiliency involve community and the help of others. Group-level resiliency strategies may also have positive effects on individuals' mental health such as improving self-esteem, reducing anxiety, and protecting against internalized transphobia. These group-level recommendations include activism and community connectedness, supportive systems and proactive agency, and supportive family and friends. Activism and collective action can be an effective resiliency strategy as it provides individuals with a community of likeminded individuals who have similar life experiences. Building a community with other trans people can provide people opportunities to mentor and be mentored, both of which can help build resiliency.

An example of a group-level resiliency strategy is collective action, such as participating in trans activism and advocating for the well-being and rights of trans people in society. Feeling a part of movements for social change and helping to uplift others in the trans community may improve individuals' resiliency. Some research suggests, however, that involvement in activism may expose people to more discrimination or may lead to burnout, both of which may reduce its positive effects for some people.

Social support, which may include membership or participation in community social activities and gatherings, has been shown to be critical for trans survival. Social support and community connectedness may help buffer against social isolation and withdrawal, which have negative impacts on individuals' mental health. Having a support system of friends, peers, and trans-affirming mental health care providers can help trans people cope when mental health challenges and other barriers arise. Family support, especially among young people, has emerged as a key resilience factor; it has been shown to be protective against homelessness, low self-esteem, internalized stigma, and suicide.

Beyond social support, another group-level factor for strengthening resiliency is access to supportive ecosystems, such as a government, workplace, or school. Not only is it important for the system to have trans-affirming policies in place, but there should also be space for the evolution of regulations where there are gaps in the support of trans people. Resiliency can be strengthened if trans individuals are in a supportive environment that allows them to self-advocate when need be and to be heard.

Resiliency has become a key part of trans collective organizing over recent years. This has been exemplified by changes in major events honored and celebrated in trans communities. One example is the shift in language around the Transgender Day of Remembrance, an annual event established by trans activists in 1999 as a day of recognition

and mourning for the disproportionate number of trans people (especially trans women of color) killed each year due to transphobic violence. In 2012, trans activists and artists of color joined to institute a shift to honoring a Trans Day of *Resilience*. The goal of this newer event is to celebrate life beyond survival—to reframe the national narrative around trans people by emphasizing the positive, strength-based aspects of trans life in the face of violence and transphobia.

Intersectionality as a Key Component of Trans Resiliency

Feminist and intersectional frameworks have been used to explore how resiliency may manifest differently for diverse trans communities. Indeed, resiliency factors and access to such factors likely differ depending on both an individual's multiple social identities and the structural forces affecting people with such identities. Feminist and intersectional frameworks thus importantly highlight the fact that different systems of oppression (i.e., racism, classism, sexism, transphobia, etc.) tend to intersect in ways that uniquely marginalize trans people with multiple minority identities. For example, racism (i.e., oppression of people of color) and transphobia (i.e., oppression of trans people) coalesce and place trans people of color at unique risk for discrimination, minority stress, and adverse biopsychosocial health outcomes. Trans young people are also affected by adultism (i.e., the domination of young people by adults), and older trans adults are affected by neglect and oppression of elders in society.

Intersectional frameworks also posit that trans people with diverse identities engage in unique, culturally specific forms of resiliency. These manifestations of resiliency are informed by people's lived experiences. As such, resiliency among forced migrants reflects having grown by engaging with processes of migration and navigating systems of asylum, whereas resiliency among young trans people is informed by having navigated and overcome adultism. Similarly, nonbinary trans people may be less likely to build resiliency through processes such as transitioning or finding gender congruence through external appearance. As such, nonbinary trans people have reported fostering resiliency by defying gender roles, insisting on gender-neutral pronouns and/or nonbinary gender markers on identification documents, and connecting with other nonbinary people on social media.

Trans people of color must contend with transphobia and racism, as well as the compounding effects of both, and thus demonstrate sophisticated and creative ways to stay resilient. In a foundational qualitative study among trans young people of color, for example, the following themes of resiliency were highlighted: identity self-definition, awareness of adultism, self-advocacy at school, community support, and using social media to connect with other trans young people of color and affirm one's own identity. Key to resiliency among trans people of color is the process of naming and identifying the impact of discrimination, then making meaning of these experiences through social support and individual growth.

Trans people who have experienced forced migration, asylum, and immigration also demonstrate unique manifestations of resiliency. Examples of factors contributing to resiliency for forced migrants include optimism and hope, community and legal support, support from partners and friends, "doing whatever it takes," and lending support to other trans forced migrants after establishing more stable footing in a new country. Trans migrants have also reported how crucial it is to engage in "spiritual upkeep" (especially among African and Caribbean migrants) as well as create and sustain alternative kinship structures, or close emotional and psychological bonds with other trans people who become surrogate family members. Across studies, trans migrants have reported inviting other marginalized trans people into their homes, helping each other recover from refugee and asylum issues, loneliness, the impacts of the HIV epidemic, and homelessness and social isolation.

Common across diverse trans populations is the importance of capacity building through social support and community services. For example, many individuals find resiliency by engaging in psychotherapy groups, support groups, and/or social actions groups working toward trans liberation. In order for such support to be effective, it is important for groups to be intersectional in their focus and practice. Latinx trans Americans, for example, report finding a sense of home and community in monolingual Spanish-speaking trans groups. Similarly, trans people living with HIV often find

solace, resiliency, and strength in groups run exclusively by and for HIV-positive trans people. Networking in these groups can lead to finding jobs, connecting with legal services, and establishing care with affirming health care providers.

Strategies to Center Trans Resiliency in Research and Practice

Trans people have historically faced disproportionate barriers to health care access and quality. Yet culturally competent research and trans-affirming health care, including mental health care, is a key source of resiliency and strength. As such, recent studies have outlined both *targets* of resiliency research and practice, as well as novel *models* that center trans resiliency in process and outcome. These models include descriptions of important targets for clinical care and models to promote wellness in psychological interventions.

Targets of Resiliency in Research and Care With Trans Communities

Across studies, scholars and practitioners have identified key aspects of resiliency to target and thus promote in clinical work with trans clients. These include collaborating with clients toward the following goals: developing a self-generated definition of self; embracing self-worth as a trans person; developing critical consciousness about trans minority stress; connecting with a supportive community; building hope, goals, and dreams for the future; engaging in activism for trans rights; and seeking and/or becoming a mentor or role model for other trans people. When promoting resiliency with trans clients, it is important to be mindful of intersectionality. Providers may thus incorporate discussions and problem solving around unique forms of stress and strengths specific to a client's other identities. When working with young trans people, for example, it is important to cultivate an awareness of adultism and promote self-advocacy in educational institutions, as well as use social media and young people–specific resources for social support. When working with trans people of color, it is crucial to incorporate specific risks and promoters of resiliency, including the impact of police harassment and systemic racism, into case conceptualization and treatment planning. Studies demonstrate trans clients have better outcomes when providers engage in psychoeducation and discuss which factors of trans resiliency mitigate or countervail gender minority stress.

Affirming Approaches to Building Trans Resiliency

Recent models of trans resiliency have emerged that highlight strategies to frame resiliency as a primary outcome in both research and clinical work, including the Minority Strengths Model, the Transgender Resilience Intervention Model, and Transgender Affirmative Cognitive Behavioral Therapy. Each of these models reflects the ways researchers and scholars have shifted the way trans health is framed: from a deficit to a strengths-based paradigm. The former, the Minority Strengths Model, is a strength-based reframing of the minority stress model. Rather than exclusively measuring the negative impact of stigma and discrimination, the model focuses on the creative strategies individuals in minority populations use to survive and thrive in the face of oppression and adversity. It describes how resiliency may improve mental and physical health outcomes, including among trans communities who face considerable adversity and stress. In this statistical model, social support was significantly associated with identity pride, self-esteem, resilience, mental health, and positive health behaviors. Community consciousness also played a key role. This model describes cascading effects by which resiliency promotes proximal strengths (not stressors), coalescing in positive outcomes.

A second model is the Transgender Resilience Intervention Model (TRIM), which similarly suggests the importance of integrating individual-level factors (e.g., hope, self-acceptance, identity pride, self-definition, self-worth, and transition) with group-level resilience factors (e.g., being a role model, community belonging, family and social support, and transgender activism) in trans research and clinical care. This model presents opportunities for researchers and clinicians to evaluate the effectiveness of promoting particular factors within their clinical work, which holds promise for increased efficacy and nuance in psychotherapy. The model not only outlines particular pathways of minority stress to target in psychotherapy but also highlights key, multilevel strategies to increase

resilience. For example, clinicians can use the TRIM model as a roadmap to tailor interventions based on which aspects of resilience may be important for each individual client. The model suggests clinicians use multiple modalities (i.e., individual, group, family, or relationship therapy) to holistically target each client's experiences with minority stressors and strengths.

Recent expansions of cognitive–behavioral therapy (i.e., psychotherapy that focuses on a client's thoughts, feelings, and behavior) have begun to incorporate trans resiliency in their approaches as well. A specific example includes a model of Transgender Affirmative Cognitive Behavioral Therapy (TA-CBT), which outlines an eight-session trans-affirming intervention including psychoeducation, modifying problematic patterns of thought, enhancing social support, and preventing suicidality by buffering resiliency. The first step of the TA-CBT model is engaging in psychoeducation, or helping clients understand the impact of discrimination on key mental health outcomes such as feelings of stress, anxiety, depression, and suicidality. After clients are better able to understand the potential impact of anti-trans attitudes and behaviors on stress, clinicians help clients overcome negative internalized messages, foster hope for the future, and develop supportive identity-affirming social networks.

Finally, given the importance of group-level factors of resiliency, it is critical that researchers, practitioners, and advocates promote structural changes that improve health care quality and access for trans people. Each of these strategies to buffer resiliency empowers trans people to build individual- and group-level skills to mitigate the impact of discrimination on stress. Yet mental health disparities continue to exist at structural levels. Clinicians and researchers are thus encouraged to target system-level sources of stress and inequity that necessitate resiliency. The field must engage in a multilevel approach to societal transformation in order to dismantle the contexts that create a *need* for resiliency in the first place.

Richards, Renée

Renée Richards was a U.S. trans woman tennis player who fought for the right to compete in women's tennis in the 1970s. She successfully challenged the use of the chromosome test as the sole criterion for entry into the sport. With the legal victory, Richards participated in the 1977 U.S. Open and lost in the first round. She continued playing on the women's circuit until 1981. Upon retirement, Richards returned to her ophthalmology practice and remained out of the headlines until the early 2000s, when she criticized the International Olympic Committee's (IOC) trans policy. Richards's legal battle not only served as a predecessor for later trans policies, but her legacy demonstrates the questions that surface when trans athletes participate in sex-segregated sport.

Richards was born on August 19, 1934, and excelled in athletics from a young age. As a college athlete, Richards won the Men's Eastern Junior Indoor Championships in 1953. She then enrolled in medical school, where she specialized in ophthalmology. During her medical internship and residency in New York City, Richards continued to play competitive tennis, winning the New York State men's clay court title in 1964. She was ranked sixth nationally in the men's 35-and-over division in 1970.

Despite her medical achievements and tennis successes, Richards was tormented. "A lot of times I was like a man form a foreign country trying to blend in with the population," she wrote in her 1983 autobiography *Second Serve: The Renée Richards Story.* Richards decided to undergo gender-affirming surgery in 1975 to start a new life as Renée. She moved to California, resumed practicing ophthalmology, and continued playing tennis.

During a 1976 tennis tournament in California, a reporter discovered that standout Rene Clarke was actually Renée Richards, participating under a pseudonym. The published exposé brought national attention to the local competition. People questioned the fairness of Richards's inclusion in the women's division and feared that her presence would encourage trans athletes to overtake women's sport. Critics pointed to her 6′2″ frame as evidence of an unfair advantage, disregarding her advanced age and effects of hormone therapy on her strength. Others argued that Richards sought to reap the financial benefits recently earned by female tennis players. Unlike many female athletes, women professional tennis players enjoy some level of pay equity; for example, the 1973 U.S. Open was the first Grand Slam tournament to offer equal prize money to men and women.

After winning the local tournament, Richards declared her intentions to compete in the 1976 U.S. Open. The governing bodies of tennis immediately barred her participation. The U.S. Tennis Association (USTA) and the Women's Tennis Association (WTA) implemented the Barr body test as a precondition for eligibility in the women's division. The Barr body test uses sex chromatin to determine chromosomal composition. Sport practitioners used the method to prohibit individuals with Y chromosomes from participation in women's tennis tournaments, disregarding opposition from the medical community that noted the falsity of using a single criterion in sex determination. The athletics federation had instituted the Barr body test in 1967, followed by the IOC in 1968. Despite the availability of the test for a decade, the USTA and WTA only enacted the method to ban Richards.

Richards responded with a lawsuit. One month prior to the start of the 1977 U.S. Open, Justice Alfred M. Ascione heard Richards's case in the New York Supreme Court. The legal challenge presented three critiques of sex testing. First, Richards questioned the reliability of the Barr

body test in sex determination. Her doctors argued that it was an inaccurate and discriminatory tool and instead pointed to a range of characteristics that confirmed Richards's sex, from anatomy to appearance. Second, Richards countered the tennis organizations' definition of womanhood. Sexologist John Money testified that an individual's sex is based on a variety of factors, including anatomy, chromosomes, genitals, hormones, and psychology. Finally, women's tennis players discussed competitive advantages. Tennis star Billie Jean King defended Richards's right to participate as a woman, positing that Richards did not possess an unfair advantage.

Ascione ruled in Richards's favor. He argued that the use of a chromosome check as the only determining factor for eligibility purposes was "grossly unfair, discriminatory and inequitable." He conceded that sport organizations could use a chromosome test as one component of an eligibility requirement; however, it could not be the sole factor in identifying a person's sex. His decision allowed Richards to compete in the 1977 U.S. Open, where she lost in the first round, 1–6, 4–6.

Although the decision pertained only to Richards, it had ramifications for other sports. Organizations instituted trans policies, with varying degrees of inclusiveness. For example, in 1991, the Ladies Professional Golf Association added a "female at birth" clause to its requirements to prohibit trans athletes. In contrast, Women's Golf Australia permitted trans athletes in 1999. The IOC also outlined a policy for trans Olympians in 2003.

Richards publicly opposed the IOC's decision. Although the policy would have allowed her to skip the courtroom to compete, she called it a "particularly stupid decision" in a 2007 *New York Times* interview. Her opposition to the Stockholm Consensus seemed to stem from notions of fairness. She believed trans athletes have an unfair advantage in sport; accordingly, her age was the reason why she did not dominate in the 1970s. Moreover, Richards distanced herself from the trans community later in life. In her second memoir, *No Way Renée: The Second Half of My Notorious Life,* written in 2007, Richards described her life after tennis as filled with personal hardships and mistreatment. She hesitated to celebrate her legal victory and seemingly regretted having served as a pioneering trans athlete in the 1970s. As with much of the controversy surrounding Richards, questions of sex, gender, and advantage coalesce regarding trans athletes in sport.

Rivera, Sylvia

Sylvia Rivera is considered the mother of the trans rights movement. She was known for cofounding Street Transvestite Action Revolutionaries (STAR) in 1970, a New York City organization that also formed STAR House for homeless youth. Throughout her life, Rivera was an outspoken advocate for LGBT rights. Using she/her pronouns, Rivera's primary identifications over time were drag queen, transvestite, and transgender person of color; her sexual orientation was to men and trans women.

Early Life

Rivera was born (July 2, 1951) in the Bronx, of Puerto Rican and Venezuelan descent, and was

named Rey; Sylvia Lee was the name given to her by the transvestite community. Her mother died by suicide when she was 3, her father was not involved, and she was raised by her maternal grandmother. As a child, Rivera was interested in female makeup, hair, and fashion; she contemplated gender-affirming surgery but did not receive any.

In response to bullying for being gay/trans, she left home at age 10. She then became, in her words, a "streetwalker" in New York City's Time Square. She was arrested for loitering and prostitution many times, sometimes bailed out by her grandmother. Rivera may have experienced sexual abuse prior to leaving home and been introduced to sex work by relatives.

Advocating for Trans Rights

From her earliest advocacy until her death at age 51 (February 19, 2002) from complications of kidney cancer, Rivera insisted the mainstream gay rights movement center the experiences of trans people. She criticized major lesbian and gay rights organizations for sidelining gender identity and held more conformist LG people accountable for discounting and trying to hide the drag queens who put their bodies on the line for gay liberation. During her life, Rivera presented her gender identity in a spectrum of ways, including effeminate boy/male, "half-sister," transvestite, drag queen, street queen, gay boy, gay girl, and transgender. Rivera is associated with her lifelong friend and fellow activist Marsha P. Johnson, whom she met at age 12 in the community of sex workers and transvestites in Times Square.

Although she is often named as one of the participants in the Stonewall Riots of June 1969, historical sources present conflicting information as to whether Rivera was inside the Stonewall Inn or outside during the night of the initial riot. Rivera is one of the central figures in Martin Duberman's 1993 *Stonewall* but is not mentioned in David Carter's 2004 *Stonewall: The Riots That Sparked the Gay Revolution*. Although in multiple interviews, Rivera speaks of being at Stonewall, historians have pointed to inconsistencies in her story. Clearly, Rivera knew of the riots the night they occurred, was there in the following days of continued riots, and had a role in many post-Stonewall protests.

Activism in the 1970s

In the wake of post-Stonewall activism, Rivera with Johnson cofounded STAR after having been a member of Gay Activists Alliance (GAA). Rivera maintained, and many historical sources confirm, that she was marginalized within GAA for her gender presentation and ethnicity. Protesting, organizing, and even testifying at City Hall, Rivera worked for equality. While fighting for gay rights laws, she consistently advocated to other gays for the inclusion of gender identity.

In 1973, Rivera spoke from the stage at the Christopher Street Liberation Day Rally in Manhattan's Washington Square Park. At that year's march, drag queens were told to walk at the back because organizers wanted to present gays more prominently, on the grounds that they were regarded as more palatable by the rest of the world. In what is called Rivera's "Y'All Better Quiet Down" speech, she asks, "What the fuck's wrong with you all?" for marginalizing her role and that of STAR in gay liberation and ignoring people like her—street transvestites of color who are often jailed. STAR was "trying to do something for all of us, and not men and women that belong to a white middle-class club—and that's what you all belong to! GAY POWER!" This brief speech seems to have marked Rivera's stepping back from the movement. Shortly after, STAR was disbanded and Rivera struggled with mental health, substance use, and homelessness. She moved just outside of New York City, worked, and organized drag shows.

Honored as "Mother" of LGBT Rights Movement

By the late 1980s, Rivera's activism and her role in the movement gained more recognition. Eric Marcus (1992) interviewed Rivera for *Making History: The Struggle for Gay and Lesbian Equal Rights, 1945–1990. An Oral History*. She was prominently featured in Duberman's 1993 book about the Stonewall era. Rivera participated in the 1992 Pride March with Johnson, who died a week later. Johnson's death marked a difficult transition for Rivera, who became homeless for many years. The two best friends had always promised each other they would "cross the River Jordan together," meaning die together.

In 1994, Rivera was given a place of honor in the Stonewall 25 pride march, according to her obituary in the *New York Times*. Rivera gained more stability and moved into a trans group home, and she started working and being politically active. In June 2000, she was invited to speak at World Pride in Rome, Italy. She said, "I didn't think, 31 years ago [Stonewall] that I would have so many children, but I am proud to have liberated you . . . continue your struggle all around the world." In the last year of her life, Rivera revived STAR as Street *Transgender* Action Revolutionaries, organizing and speaking for equality of trans and poor people as well as people of color and those in prison.

Rivera has been honored with many monuments, murals, awards, organization names, and public recognitions of her contribution to trans rights. The Sylvia Rivera Law Project was established in 2002 after her death. The corner of Christopher and Hudson streets (two blocks from the Stonewall Inn) was renamed "Sylvia Rivera Way" in 2005. Rivera is the first trans activist featured in the National Portrait Gallery (2015). With Johnson, Rivera is the focus of children's books about trans women of color.

S

Scripted TV

Images of minoritized individuals matter, in terms of both quantity and quality. Historically, trans people were largely invisible in the media, including on television. On the rare occasion that a trans character made it on to the small screen, the representation was one of a pariah or a punchline. Recognizing the power of the media, trans advocates fought for increased visibility and more accurate representations. In the 2000s, the contours of the television landscape have changed dramatically, but most trans advocates maintain that further changes are necessary.

Historic Firsts

The history of depictions of trans people on television includes these firsts.

- In 1977, *All That Glitters* featured the first trans regularly occurring character in a television series, played by Linda Gray of *Dallas* fame. This short-lived series, produced by Norman Lear, was a primetime soap opera that took a satirical look at a world ruled by women.
- From 2006 to 2007, Zoe Luper, played by Jeffrey Carlson, became the first trans character on a U.S. daytime soap opera, *All My Children* (ABC). Zoe first appeared as Freddie Luper, an English rock star millionaire who was suspected of being a serial killer. Zoe was attacked by the real killer and survived, thus clearing her of suspicion.
- In 2007, Candis Cayne became the first trans actor to play a recurring trans character on a primetime series, in *Dirty Sexy Money* (ABC). The character was the mistress of one of the series' main characters. Cayne later had a recurring role as a trans character in Season 6 of *Nip/Tuck* (FX). She also had ongoing appearances in *RuPaul's Drag U* (Logo TV), *I Am Cait* (E!), *Elementary* (CBS), and *The Magicians* (Syfy).
- In 2013, Laverne Cox was the first openly trans person to be nominated for a primetime acting Emmy Award for her portrayal of Sophia Burset on *Orange Is the New Black* (Netflix). Burset was a prison inmate found guilty of credit card fraud, which she committed to fund her gender-affirming surgery. Cox later won a Daytime Emmy Award in Outstanding Special Class as executive producer for *Laverne Cox Presents: The T Word*. She had recurring appearances on *Doubt* (CBS), *I Want to Work for Diddy* (VH1), and *TRANSform Me* (VH1).
- Asia Kate Dillon was both the first nonbinary trans actor to appear on a television show and the first actor to play a nonbinary trans character, with their role as a hedge fund intern in *Billions* (Showtime) beginning in 2017. Dillon was nominated for a Critics' Choice Television Award for their portrayal. Prior to this series, Dillon played a white supremacist inmate in *Orange Is the New Black*.

- In 2018, trans actor Nicole Maines played the first trans superhero, Nia Nal/Dreamer, in *Supergirl* (CW). Born with precognition superpowers, the character works as a speechwriter for the White House press secretary. Of note is the fact that Maines and her family sued her school district for barring her from using the female bathroom. The case went to the Maine Supreme Court, which ruled that the district had violated the state's Human Rights Act and had to provide bathroom access consistent with students' gender identities.
- The show *Pose* (FX) made television history in 2019, when it premiered with the largest number of trans actors in a scripted series, including five trans women of color: Dominique Jackson, Indya Moore, MJ Rodriguez, Angelica Ross, and Hailie Sahar. The series spotlighted New York City's African American and Latinx LGBTQ ballroom culture in the 1980s and 1990s. The series was nominated for both Golden Globes and Primetime Emmys.

Negative Representations

Historically, most roles for trans characters on the small screen were peripheral to the ongoing storyline or appeared in one episode. In the earliest storylines, trans people served as objects of confusion, ridicule, and sensationalism. Some early portrayals conflated sexuality and gender. For example, Billy Crystal's character in the hit series *Soap* (ABC) began the first season wanting gender-affirming surgery but then realized he was a gay man.

Historically, trans stock characters were developed as villains, ranging from psychotic killers to deceivers, especially in crime shows. For example, *Nip/Tuck* based an entire season on a storyline about a trans woman who is a baby-stealing sexual predator who had sex with her own son. Trans characters were also commonly represented as sex workers, victims, or both, as in the case of a trans character on *Ally McBeal* (Fox), who was murdered while engaging in sex work. GLAAD, an organization that monitors LGBTQIA+ representations in the media, found in a 10-year study of television programs (2002–2009) that trans characters were villains in 21% of episodes, were in a "victim" role 40% of the time, and that the most common profession of trans characters, in 20% of shows, was sex worker.

In addition, dialogue and camera work often fetishized and hypersexualized the trans body. Like other media, scripted television often distorted the truth of gender identity, locating it in outward gender markers, like the Adam's apple, breasts, vocal pitch, and genitalia. Television historically reduced trans characters to their physical state, rather than developing them as well-rounded, complex characters. For example, in *Dirty Sexy Money,* the two trans characters were depicted as engaging in extramarital affairs and incestuous relationships. These exploitive images sensationalized trans people.

Visibility

The number of trans characters in both leading and support roles increased in the 2000s across varied platforms (broadcast, cable, and streaming). *Time* magazine went so far as to declare in 2014 that the U.S. media had reached a "transgender tipping point" and featured Laverne Cox on its cover. Whether this observation was accurate remains contested. According to GLAAD's 2019 *Where We Are on TV* report, there were 433 regular and recurring LGBTQIA+ characters on scripted broadcast, cable, and streaming programs that year. Six percent of these characters were trans, including 17 trans women, 5 trans men, and 4 nonbinary characters. These characters were racially diverse, including 11 white characters, 5 African Americans, 6 Latinx, and 4 Asian Americans. Half of the characters were heterosexual; six were lesbian, gay, or bisexual; and seven were "undetermined." Cable and streaming featured more trans characters than broadcast networks. Although the number of trans characters has increased and diversified, the amount of screen time remains limited, and the number of roles is growing faster than the number of television series. More than a quarter of the trans characters depicted in 2019 came from two series, *Pose* and *The L Word: Generation Q* (Showtime).

Contemporary Challenges

Although the era of trans invisibility in scripted television may be over, and television programming is less likely to rely on trans stock characters

today, critics have identified several other troubling trends. First, storylines have been much more likely to center on trans women than trans men. *Good Girls* (NBC), *The Chilling Adventures of Sabrina* (Netflix), and *Grey's Anatomy* (ABC) were among the few shows to offer visible trans male characters in the 2010s. The failure to depict trans men is a missed opportunity to affirm their identities and inform cis viewers about their experiences.

Second, storylines have been much more likely to center on trans characters who identify as either masculine or feminine, seldom depicting nonbinary individuals. Asia Kate Dillon's character in *Billions* and Bex Taylor-Klaus's character in *13 Reasons Why* (Netflix) have been among the only programs to feature nonbinary actors and roles. In this regard, scripted television fails to challenge the gender binary and privileges gender-conforming modes of trans embodiment.

Third, storylines have typically focused on trans coming-out narratives at the expense of other, more varied possibilities. In the vast majority of episodes with trans characters, their identities have been the source of narrative conflict that propelled the plot forward. Being trans was often reduced to the physical and/or social transitioning process, and these coming-out narratives frequently unfolded in very predictable ways. The focus on coming out also often functioned to reify a gender binary.

The casting of trans roles in television has remained a significant point of contention. Even though the number of trans characters has increased, most of these roles have been cast with cis actors, diminishing opportunities for trans actors. For example, the decision to hire cis actor Jeffrey Tambor for the lead role in the hit series *Transparent* (Amazon Studios) stirred controversy. Furthermore, when trans actors are called in to read for a show, they are typically considered only for parts written for trans characters. For this reason, trans actors face the difficult question of whether to come out professionally and whether to pursue trans and/or cis roles. Efforts are just beginning to increase the availability of a wider number of roles for trans actors. For example, Jen Richards of *Blindspot* (NBC) is one of a small but growing number of trans actors playing characters who are not explicitly trans.

Industry Response

In an attempt to address some of these criticisms and increase representational accuracy, more executives are hiring trans people behind the scenes as show consultants and to write, cast, and produce television series. Joey Soloway, who directed *Transparent,* earned respect for employing trans people, both on- and off-screen, as well as for creating a trans-supportive work environment for the cast and crew. In 2019, Netflix signed a 3-year, multimillion-dollar deal with trans actress and activist Janet Mock for exclusive rights to her television and film projects. Mock was also hired to serve as executive producer and director of *Hollywood*. The ability for trans people to tell their own stories is critical to future improvements in scripted television.

Despite the criticisms and challenges, programs featuring trans characters have earned both commercial success and critical acclaim. *Orange Is the New Black* received five Primetime Emmys and *Transparent* won two Golden Globes. Asia Kate Dillon earned a Critics' Choice Television award nomination for Best Supporting Actor in a Drama Series, after being allowed to submit to either the Best Supporting Actor or Best Supporting Actress category. This gender binary was a catalyst for the MTV Movie and TV Awards to combine their gender-segregated acting categories in 2017. These types of honors help future projects with trans characters to be greenlighted and encourage television executives to pay more attention LGBTQIA+ viewership.

Impact on Audiences

Because trans people are a small percentage of the population, many cis people do not have direct interpersonal experiences with trans individuals, and what they know about the trans community is limited to what they see in the news and entertainment media. If this information is unavailable or inaccurate, they remain uninformed and often maintain stereotypical views of trans people. At the same time, exposure to storylines featuring trans characters is associated with more supportive attitudes. Thus, television visibility has the potential to reduce transphobia and increase the social acceptance of trans people.

Television also has the potential to affect trans viewers. Being invisible in the media or represented in inaccurate ways can undermine their sense of self and agency. This is why the trans teen characters played by Jordan Todosey on *Degrassi: The Next Generation* (Epitome Pictures), Tom Phelan on *The Fosters* (ABC), and Hunter Schafer on *Euphoria* (HBO) are so critical. These representations provide important role models for young trans viewers who are struggling to accept themselves.

The regulation of trans identities continues on the small screen, as does the laudable work of trans advocates to challenge transphobia and cisnormativity. Trans activism has heightened awareness within the industry and among viewers, and it has pushed producers to be more trans inclusive. These efforts must continue to ensure that trans roles continue to grow and become more nuanced and varied.

Sex Assignment

From gender reveal parties to birth registries and baby showers, presumed sex and sex assigned at birth continue to be cultural phenomena for U.S. families today. Its historical roots in Western cultures are based on arbitrary civil and cultural precedents that use assigned sex to bestow civil and legal rights. As human rights and social opportunities have become more equitable among the sexes and as binary assumptions about "maleness" and "femaleness" increasingly come under question, there are growing discussions about the nature of gender development and identity, with evidence suggesting that an inclusive and affirmative approach is most healthful for individuals and communities.

Sex Differentiation

Sex assigned at birth is the designation of male or female, in most instances based on the genitalia (commonly a penis or vulva) found on prenatal ultrasounds or evidenced at birth. This one characteristic of sex, which typically results from chromosomes and hormones during fetal development, is the basis for the female/male sex marker on birth certificates that indicates someone's "legal sex."

Sex differentiation is a progression of genetic, gonadal, hormonal, phenotypic, and psychological stages of development. It is dependent on testosterone and Mullerian inhibiting substance (MIS)–based virulization; absence of these hormones results in default progression into a traditionally female physical development.

During fertilization, the egg contributes an X chromosome, and the sperm contributes either an X or Y chromosome. Sex development is a multistep process with bipotential gonads that develop into ovaries or testes, depending on the presence or absence of the *SRY* gene on the male Y chromosome. Absence of the Y chromosome or *SRY* gene allows gonads to develop into ovaries. Individuals who are assigned as male at birth usually have external genitalia that include a penis and two testes because of the effects of the Y chromosome (XY). Individuals who are assigned female at birth usually have a vulva, vagina, and uterus with two ovaries because of having two X chromosomes.

It is estimated that intersex individuals—that is, people who are born with a chromosomal pattern, a reproductive system, and/or sexual anatomy that does not fit typical binary notions of male or female bodies—occur at a rate of 2.2 per 10,000 births. Available medical evidence strongly suggests that variations in sex development are part of the biologic norm and that these variations are better addressed through approaches that accept and affirm, rather than pathologize, the difference. Thus, it is more appropriate to counsel families during prenatal and early childhood wellness visits that an intersex variation should not be attempted to be "corrected" through surgeries unless absolutely medically necessary. Families should also be advised that the child's sex assigned at birth will mostly likely be congruent with their gender identity, but not always, and that gender diversity is a normal aspect of human development.

Gender Roles and Gender Identity Development

At birth, someone's visible genitalia typically determine the sex they are assigned. In Western cultures, this designation of male or female often leads to expectations from families and communities about how the person should express and enact their gender. These assumptions might include specific roles to which a person has to adhere and ways that they are to present themselves physically through hair, makeup, clothing, and accessories. However, the cognitive, emotional, and behavioral traits that are ascribed to being female or male are not innate but are socioculturally and arbitrarily determined. Children and adolescents are socialized directly and indirectly by parents, other adults, institutions, and their peers to conform to established gender roles.

Another nodal point for gender development diverging from sex assigned at birth is around the onset of puberty. Changes in hormones at this time often lead to the development of secondary sex characteristics that contribute to a person being perceived as male or female. Emotionally, puberty is an important time to reflect on a developing adult persona, which includes one's gender identity. For many youth, their gender identity will be the same as their assigned sex at birth (i.e., they will identify as cis), but for others, there will be differences between these two aspects (i.e., they will identify as trans women, trans men, nonbinary). Nonetheless, gender identity can be fluid and, for some, can change over a person's lifetime. Gender affirmation, or the acknowledgment, respect, and equity for all gender identities, is a core professional medical value, as well as a fundamental human right.

Individual abilities do not appear to be based solely or largely on sex assigned at birth, and as such, the imposition of limits on social and cultural opportunities on the basis of assigned sex is increasingly recognized worldwide as unjustified. Gender stereotypes can be arbitrary and restrictive by not allowing people to fully accept, express, and live their authentic selves. Enabling all people to have equal access to opportunities and not have these experiences and resources be restricted by gender is a relatively new but critical aspect of reproductive justice and basic human rights.

Sex Therapy

Sex therapy with trans people requires that a clinician have a sex-positive perspective on sexual health and consensual sexual practices and experimentation. The World Health Organization (WHO) defines sexual health as including physical, mental, emotional, and social well-being. Trans sexual health sits at the intersection of gender identity and expression, sexual orientation, and individual desire landscapes. Historically (1950s–early 2000s), sex therapy has emphasized sexual performance and centered the experience of able-bodied, heterosexual, monogamous people. Beginning in the 2000s, clinicians began to *queer* sex therapy, which allows for sexual identities and practices that exist outside the two-gendered binary and are inclusive of erotically marginalized trans people.

History of Trans Sexuality and Sex Therapy

Sex therapy that specifically attends to trans concerns, and specifically to gender identity experiences and sexual identities and practices, is mired in the discourse of 18th- and 19th-century sexology that promotes an ideology of sexual health and pleasure through the lens of heteronormativity. In 2004, Arlene Istar Lev published *Transgender Emergence,* the first clinical text addressing therapeutic competency in individual, couple, and family mental health care for transgender people. Lev was the first to acknowledge that theories of sexual orientation and practice are founded on the binary constructs of "same" and "opposite" partnerships in sexual relationships. Due to binary concepts of gender "sameness" and "opposites" in the sexual health field and in sexual health research, trans sexual and erotic identities and desire landscapes are often missing from clinical sex therapy education programs, sex therapy trainings, and academic research and literature.

Recent publications, however, have begun to address this. In 2017, Anneliese A. Singh and lore m. dickey published *Affirmative Counseling and Psychological Practice With Transgender and Gender Nonconforming Clients*. Singh and dickey offer a guide to clinical competency in working with transgender clients, as well as those who identify outside of the gender binary (including gender-nonconforming, genderqueer, nonbinary, and agender identities). Most recently, in 2019, the concept of erotic marginalization was introduced in the clinical text *Sex Therapy With Erotically Marginalized Clients,* by Damon Constantinides, Shannon Sennott, and Davis Chandler. *Erotic marginalization* is a term that refers to people who are at risk of being pathologized and oppressed on the basis of their gender identities, sexual orientation, and their sexual practices. Trans people are erotically marginalized and are at a higher risk of being oppressed both inside and outside of clinical settings. The possibility of clinical misattunement is even higher when talking about gender identity and sexual practices and orientation with trans clients; therefore, training and education in sex therapy with a specific focus on trans affirmative sex therapy are ethically advised.

Queering Sex Therapy

Sex therapy with trans people has only been properly acknowledged as its own field since around 2010, at the earliest; some would say it is still not offered the recognition that it deserves. One of the reasons for the lack of recognition as a field is an absence of language and theory to describe the nuances of gender identities and sexual practices that are encompassed in the lived experiences of trans people. The approach of *queering* the theoretical lens of sex therapy means a clinical shift away from a heteronormative two-gendered binary

perspective of sexual practices, sexual orientation, and gender identity. Queering sex therapy is a way of affirming the nuances and subtleties of trans sexual identities and expansive gender identity experiences. An affirming sex therapy model for working with trans clients is founded on three theoretical positions. The first theoretical concept is the transfeminist clinical approach, pioneered in 2011 by Shannon Sennott; the second is an understanding of the stages of gender-nonconforming identity emergence, as detailed in Arlene Lev's publication *Transgender Emergence;* and the third is the use of a "queered" therapeutic lens that emphasizes allyship and attunement to both trans clients and their partners.

Sexual Experiences and Challenges

Gender dysphoria and genital dysphoria both have an enormous impact on the sexual practices of trans people; however, it is also true that many trans people celebrate the ways that their bodies and sexual experiences are complex and unique. Pride is cultivated through redefining and renaming sexed body parts, including genitalia and erogenous areas, to allow for affirming language to be used in communication about intimacy and erotic templates with sexual partners. Trans people do not only explore their sexuality through partnership; in fact, many use online gaming, fantasy, cosplay, and cybersex to explore and affirm their sexual practices and identities. In existence is a robust subsection of trans people who build kink and BDSM communities, both in person and virtually, all over the United States. The most recent research shows that a majority of trans people identify as actively dating, but only around one third identify as sexually satisfied. Online dating can feel isolating, as trans people often feel there is no category for them in dating apps, so that they are therefore subject to more oppressive and intrusive questions and experiences with prospective connections and must deal with more rejection in online dating.

Medical Treatments and Sexuality

Affirming medical and surgical interventions for trans people can have a wide range of effects on the erotic template and sexual satisfaction of individuals. It is common for gender-affirming hormones and surgeries to have a positive impact on trans people's sense of embodiment and feelings of gender identity authenticity. Research shows that transmasculine, nonbinary, and transfeminine people generally feel more sexual and erotic fulfilment after having gender-confirming surgeries and treatments. Medical and hormonal treatments increase feelings of belonging in one's body and the experience of authentic and true selfhood. It is important to note that not all trans people seek surgical or hormonal treatments, and a clinician should never assume that they are a desired aspect of a person's identity landscape.

Clinical Considerations for Trans Sex Therapy

Trans people may or may not be partnered when seeking out sex therapy. If someone is in the early stages of awareness and understanding about their gender identity, it is valuable for them to build a support system within which they find others to confide in, as well as try on new identities. If a trans person is partnered, it can be useful to meet with both (or all—some might have multiple sexual partners) people together, to increase comfort in communication about sexual feelings and practices.

As therapists Arlene Lev and Shannon Sennott assert, the sex therapist's role in supporting trans sexuality and practices is three-pronged: self-awareness, self-education, and transparency. Clinicians must be aware of their own countertransference related to diverse gender identities and expressions; the way to achieve this is through self-awareness, self-education, and transparency with clients. These three concepts enable therapists to co-create language and understanding with clients, bringing meaning to gender journey experiences and then supporting them in finding comfortable ways to communicate about their erotic landscape and sexual practices. Sex therapy for trans people and their partners calls for clinical practice based on models that incorporate trans feminist principles, therapeutic advocacy and allyship, and the concept of preemptive radical inclusion. Therapists will generate an accountable environment for sexual partners to explore their erotic templates and intimate desires.

Self-Awareness

Self-awareness on the part of the clinician is a critical component of a therapeutic relationship with trans clients. The therapist must be aware of their reactions to clients stemming from personal beliefs. Most important, a therapist should not subject their clients to personal prejudices and biases related to aspects of trans identity development. If a therapist realizes that they are not able to support a client due to personal beliefs, they are advised to seek out an American Association of Sex Educators, Counselors and Therapists (AASECT) certified supervisor, explicitly trained in sexuality and gender identity, to support them in providing gender-affirming therapy to their trans clients.

Self-Education

Self-awareness could lead a clinician to realize they lack the appropriate knowledge to support their trans clients. If this is the case, then self-education can be the most effective way to move forward. Educating oneself does not include asking the client to educate the therapist. Many trans people have experienced retraumatization when a therapist seeks to be educated by them. At the least, clinicians must educate themselves about sexual practices and erotic desires for queer and trans sexualities; otherwise, they will likely reenact transphobic and oppressive dynamics in the therapeutic relationship. If the therapist can model a depathologizing stance, it will encourage relational connectedness and openness between trans people and their partners. Most critical to self-education is taking a therapeutic position of affirming curiosity while mirroring the language used by clients regarding sexual identification, names of sexual practices, and body parts.

Clinical Transparency

Clinical transparency is the foundation of the therapeutic alliance with trans people. Once a therapist has engaged in a personal inventory that leads to self-awareness and then sought out the clinical supervision and other resources that they need to self-educate, they are able to offer their clients transparency that is clinically appropriate. It is the transparency with clients that is the action of relational social justice, the therapeutic offering from a therapist to the client. Clinically appropriate transparency sends a message that the therapist understands their own position of privilege and the power that accompanies that privilege. It also allows for clients to see their personal sexual and gender journey as unique and nuanced, as one of a kind. As Lev and Sennott point out, transparency allows for a complex and personalized sexual and gender journey to come to life in the therapeutic room and also support the integration of past identities with present and future experiences. Clients are also more able to share fears about sexual practices, sexual attractions, and any physical or social transitions. Most important, therapeutic transparency allows for the clinician to offer their authentic care and support to a client's newly emerging sexual narrative and confirm that they do not need to fit into any predetermined arc of what sexual experiences as a trans person might feel like.

Sex Work

Sex work is an umbrella term that refers to a wide range of forms of erotic products and services, including commercial sex, erotic webcamming, exotic dance, and pornography. Carol Leigh, commonly known as The Scarlot Harlot, coined the term *sex work* in the 1970s as a way to assert that selling sex is a legitimate form of labor. Research suggests that trans people have participated in various sex work industries for thousands of years.

The majority of academic literature on trans sex work focuses primarily on trans women; however, a 2020 book by Angela Jones asserts that the focus on transfeminine people overlooks transmasculine and nonbinary sex workers. According to data from the both the 2015 U.S. Transgender Survey (USTS) and the National Transgender Discrimination Survey (NTDS), 12% to 13% of respondents reported performing sex work at some point in their lives, with transmasculine people comprising between 19% and 25% of all trans sex workers. Furthermore, between 16% and 30% of respondents were nonbinary sex workers. These findings suggest that more transmasculine and nonbinary people sell sex than previously expected, thereby highlighting the need to attend to their workplace experiences to fully understand those of trans sex workers (TSWs). This entry aims to heed this call, taking a systems perspective with regard to sex work. It briefly covers intersectional factors, legal issues, discrimination, and activism and advocacy, in relation to sex work.

Intersectional Factors

The majority of academic literature on trans sex work views trans people (and trans women specifically) as a public health threat that needs to be resolved, rather than addressing their workplace experiences and needs. Activists and academics thus call for intersectional approaches that examine how intersecting systems of power may contribute to TSW workplace needs and experiences. This section, while not exhaustive, outlines some salient intersectional experiences that may enhance stigma and marginalization.

Whorephobia and Transphobia

Whorephobia is a term predominantly used by sex workers to refer to negative attitudes toward people participating in sex work. In many countries around the world, whorephobic attitudes affect legislation and cultural norms that render sex industries as sectors where workers experience enhanced marginalization.

Transphobia refers to negative attitudes, aversion toward, and hatred of trans people. Research around the world suggests that, due to pervasive transphobia, trans people are more likely than cis people to experience poverty, family rejection, trans-antagonizing victimization, and lack of legal protections against discrimination and violence, among many others. Taken together, these factors can increase the likelihood of experiencing discrimination on the basis of trans identity or work.

Migration

Around the world, activists advocate for attention to TSWs who are also undocumented migrants. Emerging research suggests that trans immigrants leave their country of origin due to trans-antagonistic victimization and prejudice, family rejection, poverty, and/or the hope of a better life in a new country. For some trans immigrants, sex work may represent a way to make ends meet in their country of origin, during their migration journey, and/or in a new country.

Although New Zealand and parts of Australia have decriminalized sex work, legislation exists that can criminalize trans migrants participating in sex industries. TSWs who are immigrants are subject to "raid and rescue" campaigns, under anti-trafficking policies and legislation worldwide. Multidisciplinary research suggests these policies may emerge from a lack of understanding and conflation between sex work and sex trafficking. Consequently, like other migrant sex workers, migrant TSWs may be at increased risk for incarceration, detention, and/or deportation.

As of 2020, the factors that push and pull trans immigrants into sex trades are unclear.

Legal Issues

In many countries, sex work industries are criminalized, directly and/or indirectly, for trans people.

Few countries have decriminalized sex work and sex workers, yet even in those countries, trans people selling sex may face unique challenges.

Criminalization of Sex Work and/or Trans Identity

As of 2020, most countries have punitive laws against sex work that result in varying levels of criminalization. Specifically, nations across the globe have varying levels of criminal penalties for commercial sex. Countries employing prohibitionist models, such as Trinidad and Tobago, China, Russia, and Sudan, criminalize all aspects of commercial sex. In nations that adopt neoabolitionist models, including Sweden, Norway, and France, selling sex is legal, whereas buying sex remains criminalized. Scholars and activists alike have criticized this approach, as it pushes sex workers into situations devoid of protections and support. In abolitionist frameworks, employed in countries such as Kazakhstan, Finland, and Paraguay, commercial sex is legal and unregulated, although organized industries like brothels and pimping are criminalized. Other nations, such as Chile, Senegal, and Turkey, adopt legalized—or regulationist—frameworks, where commercial sex is legal and regulated. Finally, in countries where prostitution (and sex work, broadly) is decriminalized, sex workers receive the same rights and protections as workers in other industries.

In addition to policy regarding sex work, TSWs are also subject to policy about their existence as trans people. As of 2020, several countries criminalize crossdressing and/or homosexual behavior, including Jamaica, Guyana, Sudan, Namibia, and Malaysia. In these countries, trans people are seen as crossdressers and/or partaking in homosexual behavior, thereby criminalizing trans identity. In countries like Algeria, where an abolitionist framework is employed, existing as trans is criminalized, thereby limiting TSWs' access to support and resources.

Very few countries have legal structures or government-funded programs that protect and support TSWs in the workplace or when interacting with justice systems and police. In places where certain protective guidelines or recommendations exist, such as the United States, there are reports of government bodies and agencies (e.g., Immigration and Customs Enforcement) neglecting to adopt these guidelines.

Regulated Systems

Within regulated systems, sex worker registration may be inaccessible to TSWs if only cis people are entitled to apply or if operating from a framework based on genitalia. Prior to registering as sex workers, trans people may have to undergo medical gender-affirming interventions to be able to access legal transition, both of which can be long and expensive processes. Additionally, in certain countries, transition may come with requirements of sterilization, assessment of competency and self-determination, or a diagnosis of gender identity disorder (GID). Activists around the world have labeled such requirements as breaches of human rights, as these requirements can deter TSWs from registering as sex workers. As such, TSWs may choose to work unregistered, thereby limiting their access to otherwise available resources and support services, as well as increasing the potential for experiences of victimization.

Discrimination

TSWs encounter discrimination across systemic, institutional, and interpersonal levels, which has implications for people's experiences across domains, including education, employment, housing, health care, and law enforcement systems. Individuals' experiences with these vary greatly across different sociocultural contexts and may influence their paths of entry into sex work, experiences as a sex worker, and ability to exit the sex trade.

Education/Employment

Discrimination in education and employment disproportionally affects trans people and is fueled by cissexism and racism. According to data collected in 2008–2009 for the National Transgender Discrimination Survey (NTDS), within the United States and Puerto Rico, rates of unemployment among trans people are twice that of the national average, with nearly all trans respondents reporting experiences of workplace harassment and approximately half of respondents reporting being

fired from a job or not hired. Research suggests that trans sex workers in the Dominican Republic face higher rates of harassment from employers and classmates compared with trans people who are non–sex workers. Similarly, among trans women of color who sell sex in San Francisco, many report experiencing unemployment and living below the poverty line. In addition to overt forms of discrimination, people may experience microaggressions within education and employment. Limited access to employment and means for affording essential needs (e.g., food, shelter, health care, transition-related care) are often cited in research as a primary force driving trans people's entry into sex work, which may be viewed as the only option for employment.

Housing

Trans people in the sex trade may experience unstable housing or homelessness and face additional barriers to accessing housing services. Qualitative research conducted in Canada and parts of Africa provide accounts of TSWs facing violence and exploitation at the hands of landlords, who force them to trade sex under threat of eviction. For TSWs experiencing homelessness and seeking housing services, discrimination may be encountered on the basis of their gender identity and expression as they engage with agencies lacking affirming and inclusive policies and staff. As such, TSWs may be forced to choose between experiencing harassment and the threat of violence within an agency (i.e., from staff or other residents) or sleeping on the street. Given gender segregation policies at many homelessness services providing shelter, nonbinary and gender-nonconforming people likely face barriers accessing shelter and may be at increased risk of trans-antagonizing victimization.

Health Care

A primary focus of extant research related to trans sex workers has framed around public health and HIV transmission and prevention, particularly given higher prevalence rates of HIV within this population. However, as of 2020, research and interventions have begun to shift to focusing on the health needs of TSWs themselves. Research exploring TSWs' experiences with health care has pointed to significant barriers to accessing general health care in addition to gender-affirming health care. Fear of harassment and discrimination, immigration status, language barriers, lack of financial resources, transportation, and knowledge have emerged as barriers to health care. Even when health care is accessible, agencies working with this population still need to ensure that their providers are educated regarding trans health issues (e.g., Informed Consent Models of Transgender Care; WPATH Standards of Care). In the absence of gender-affirming health care, TSWs may engage in transition-related behaviors such as uncontrolled use of hormones and silicone injections, which can have negative health consequences. Sex workers cite the criminalization and stigmatization of sex work as significant barriers to accessing sexual health care, including testing and treatment for sexually transmitted infections, treatment of injuries resulting from sexual assault, and limited access to condoms and lubricant.

Police and Court Interactions

Harassment and assault may be experienced by TSWs at high rates both within and outside the context of their work. However, incidents of harassment, discrimination, and physical or sexual violence are often underreported to the police. TSWs report fears of their concerns being dismissed or experiencing secondary victimization by the police. This reluctance to report crimes to the police is often informed by a context in which police perpetrate physical and sexual violence against trans sex workers, as has been reported across Africa and Latin America, India, Canada, and the United States. Additionally, in the United States, popular press articles and personal accounts point to experiences of sexual violence while detained in Immigration and Customs Enforcement (ICE) facilities. If incarcerated or in detention, TSWs are often placed into facilities according to their sex assigned at birth rather than gender identity, putting them at heightened risk of violence.

Activism and Advocacy

Trans sex workers' activism and advocacy take place at varying levels: individual, informal

networking, and organizational. International umbrella organizations (e.g., Global Network of Sex Work Projects) as well as local groups work to promote health and human rights, drive research, and build platforms for policy change. Such organizations are driving movements aimed at decriminalizing the sex trade. Many organizations are self-organized by and for sex workers, facilitating peer support and community networks that respond to needs, whether those be educational, financial, or building trade-specific and general skills. Examples of community responsiveness include the South Africa–based Sex Workers Education and Advocacy Taskforce (SWEAT), which engaged in mutual aid during the COVID-19 pandemic. SWEAT also created and distributed materials on how to minimize risk of exposure to COVID-19, which may potentially disproportionality affect TSWs.

Other examples include challenging specific policies targeting TWS. The "Don't cut my hair" campaign was launched in Hong Kong in response to discriminatory policies enacted by law enforcement agencies. One of these policies included forcing incarcerated trans women sex workers to cut off their hair when detained while allowing cis women sex workers to keep their hair. Finally, although not an organization specifically for TSWs, the TransLatin@ Coalition's advocacy and activism support undocumented trans people during and after detention to facilitate reintegration via resources related to housing, employment, and health care.

Sex Workers

Owing to the systemic, interpersonal, institutional, and occupational discrimination that trans individuals face, some trans people turn to sex work. Sex work is broadly defined as the exchange of sexual products or services for money or material goods. Despite the high number of trans sex workers, there is scant research on the nature of sex work for trans people as compared with cis sex workers, although it is generally recognized that trans sex workers' experiences differ in important ways from those of cis sex workers. In this entry, risk factors for trans individuals' engagement in sex work are identified, such as economic disadvantage. This entry also addresses related topics—such as work- and family-related issues, drug usage, and human immunodeficiency virus (HIV) diagnoses.

Contributing Life Factors of Trans Sex Work

One of the most common life factors experienced by trans people who engage in sex work is economic disadvantage. Indeed, trans people are unemployed at a rate double that of the national average. A major contributor to this social plight is discrimination during the hiring process. Trans individuals who disclose their identity with potential employers may face an increased likelihood of not receiving callbacks or being removed outright from the list of potential hires on the basis of discrimination.

Additionally, while it is difficult for trans individuals to secure employment, it is also difficult for these individuals to maintain employment, as many employers foster hostile, prejudicial work environments. Almost all trans people report experiencing some harassment or maltreatment on the job. Trans individuals are often subjected to overt and subtle forms of discrimination in the

workplace, including transphobic jokes, pointed isolation, sexual harassment, and, at extreme levels, threats of violence. In addition, many mandatory antidiscrimination programs implemented by employers fail to discuss or acknowledge transphobia. Workplaces also often have inadequate policies against transphobia, if they have any at all. This perpetuates a lack of knowledge, sensitivity, and protection for trans individuals and the conflicts that they may face, which further contributes to an uninviting work environment. The combination of all of these factors results in the impoverishment of trans individuals, which, in turn, creates a pathway to engagement in sex work.

In addition to facing biases and prejudice at the institutional level, trans people also face discrimination in their interpersonal lives. Trans youth often undergo rejection and abandonment from family members who struggle to grasp the notion that biological sex and gender are different concepts and who may not accept a youth's gender identity. Consequently, trans youth often live in homes riddled with tension and conflict. In worst-case scenarios, trans youth are the target of violence and abuse in their own homes because of their gender identity. Families' refusal to accept trans youth can lead to youth becoming homeless. Indeed, sometimes trans youth are expelled from the family home for their gender identity, or they choose to leave homes that do not feel safe or supportive. Moreover, homeless shelters and group homes are not always safe and accepting; sometimes, homeless trans populations are not able (or allowed) to shelter within these facilities. For these young trans persons, sex work provides an effective means of securing money and other basic necessities. This type of sex work, defined as survival sex, is the exchange of sexual favors for basic necessities such as food, shelter, and clothing. Survival sex is a common practice not only among trans youth but also among trans populations as a whole. A common theme in trans engagement in sex work is financial support or gain.

Another common life factor contributing to trans involvement in sex work is the desire to feminize or masculinize one's appearance. For trans women, customary practices of feminization include breast augmentation surgery, genital reassignment surgery, estrogen treatments, and feminizing facial surgeries. For trans men, frequent methods of masculinization include male chest reconstruction therapy, testosterone treatments, genital reassignment surgery, and masculinizing facial surgeries. These gender-affirming surgeries and procedures are extremely costly and often not covered by insurance companies. The desire for trans individuals to validate their identity physically and to garner positive self-esteem is yet another factor that leads to sex work, either as a primary or supplemental form of income.

While there are few large-scale studies focused on trans sex workers, self-reports and personal narratives give insight into the nature of sex work for trans individuals. One major theme that emerges from these accounts is the co-occurrence of violence and sex work. As with any form of sex work, an individual's safety and health is compromised during the solicitation of clients. For sex workers, stable housing and Internet access are the defining features that designate whether or not they are able to work in an outdoor or indoor space. For those with stable housing and Internet access, sex work is much easier to navigate safely. However, for sex workers who may be homeless or constrained to working in areas characterized by economic disparity, the risk of violence is much higher. This is relevant to the context of trans sex work because many trans individuals are barred from indoor sex work environments due to transphobia and the enforcement of economic hierarchies in sex work professions. Thus, by being limited to working almost exclusively in outdoor environments, trans sex workers face a much higher rate of violence than cis male and female sex workers. Personal accounts from trans sex workers denote that common types of violence inflicted upon them include forced sex, physical beating, and threat of death. The risk of violence for trans sex workers is ever present, but many trans sex workers report feeling resigned to accept this issue. Indeed, reporting violence to law enforcement can threaten the safety of trans individuals; sex work is criminalized in most of the United States. In short, trans sex workers' fear of arrest, lack of intervention from law enforcement, and/or discrimination from law enforcement contribute to high rates of unreported violence.

Drug Abuse

The link between sex work in general and drug abuse is complex. First, owing to high levels of violence perpetrated against trans sex workers, some may abuse drugs as a means of escape or in order to self-medicate for relief from pain. Indeed, some trans sex workers experience posttraumatic stress disorder (PTSD) stemming from sexual violence. Experiences with PTSD may cause trans sex workers to self-medicate with drugs. Second, trans women experience rates of depression and anxiety at higher rates than the general population. Due to the disenfranchisement of trans people collectively, resources to combat mental health issues in this population are not readily available. In the absence of adequate mental health care, some trans individuals cope with mental health struggles via drug usage. Third, trans individuals may experience interpersonal issues that lead them to use drugs. For instance, many trans individuals are denounced by, and exiled from, family and friends after disclosing their gender identity. These negative experiences serve as risk factors for drug abuse and addiction within trans populations.

The connection between sex work and drug abuse is undeniable. Indeed, while some trans sex workers use drugs to escape the trauma of sex work or alienation from friends and family, others engage in sex work as a means of affording drugs. The combination of sex work and drug abuse compromises not only the mental health of trans sex workers but also their physical health.

Sex Work and the Risk of HIV

Individuals engaging in sex work and drug use have a higher chance of contracting HIV and other sexually transmitted illnesses, regardless of gender identity. Members of the trans community have a higher rate of engagement in sex work and drug abuse than those in the general population; for this reason, trans people are at higher risk of contracting HIV. One risk factor for the contraction of HIV and other sexually transmitted infections is the occurrence of condomless sex while engaging in sex work. Many trans sex workers are offered more money for condomless sex, which of course increases vulnerability to HIV and other sexually transmitted infections. Likewise, some trans sex workers choose to have condomless sex at their own discretion, as condomless sex is perceived as more pleasurable. In addition, for some trans sex workers, feminizing hormone therapy can decrease the likelihood of achieving and maintaining erections. In order to combat this, some trans individuals may forgo condom usage in order to achieve and maintain erections. With regard to drug or alcohol use, intoxication may lower a person's ability to negotiate condom usage during sex work. In addition, using needles to inject drugs is a risk factor for contracting HIV. Taken together, some or all of these behaviors surrounding sex work (and/or drug use) can increase the likelihood of trans sex workers contracting HIV.

The Criminalization of Trans Sex Work

Trans sex workers are more likely to face criminalization for engaging in sex work than their cis counterparts, for several reasons. First, due to commonly working in outdoor environments, trans sex workers are at increased risk of being visible to—and coming into official contact with—law enforcement officials. Moreover, in prostitution-free zones, trans sex workers are targeted by law enforcement more than their cis counterparts, on the basis of discrimination. In some countries, trans sex workers are routinely picked up by law enforcement officers as a means of securing bribes in exchange for their freedom.

Not only do trans sex workers face a higher threat of arrest, but they also face a higher probability of being abused within detention facilities once arrested. Importantly, trans individuals are often forced to reside in jails or prisons on the basis of biological sex, rather than gender identity. Importantly, trans women are common targets of sexual violence and harassment within detention facilities, perhaps due to their feminine appearance or their lessened ability to fit in with other incarcerated people.

Many detention facilities lack proper sensitivity training for guards on the subject of trans issues; simply put, ignorance and transphobia are common within most prison systems. Many trans inmates perceive a lack of protection, and they may face violence at the hands of prisoners and guards alike. In addition, the absence of proper information and training on trans issues for

correctional officers may cause them to perceive trans individuals as deserving of, and/or responsible for, the violence perpetrated against them. Some prison guards feel that trans inmates should adhere to their assigned sex rather than their gender identity. In many ways, the trans population as a whole is discriminated against, and dehumanized, within the criminal justice system.

The Way Forward

Trans sex workers—and trans people in general—would benefit greatly from affordable and accessible mental health and physical health care services. More accessible shelter space is needed, and existing shelters willing and able to house trans people should be easily identifiable to those in need. Finally, improved training for police officers and correctional officers is desperately needed.

Sexology

Sexology is typically understood as the study of human sexuality. The field is primarily associated with natural scientific methodologies—biomedical and clinical psychological frameworks. The field has a history of over 100 years and has been chiefly concerned with the etiology (cause) and treatment of “sexual disorders.” This has been problematized for taking heterosexuality and cisgender status for granted as “normal” and, correspondingly, conceptualizing gender and sexual diversity as pathological or deviant. This entry provides a brief history of the field of sexology, touches on adjacent areas of study, and highlights the work of key contributors. Next, the relationship with early research and clinical interventions for trans people is discussed. The entry concludes with an overview of contemporary developments in sexology. Extensive conceptual critiques of sexology (particularly from the social sciences and humanities) have led to the emergence of critical sexology, which will be considered.

A Brief History of Sexology

The early development of sexology originated in the second half of the 19th century, specifically through the work of key researchers trained in medicine, primarily practicing across psychiatry and psychology. These included the German psychiatrist Richard von Krafft-Ebing, who authored one of the earliest formal medical works on sexual disorders, *Psychopathia Sexualis,* in 1886. This work paid particular attention to male homosexuality and began the popularization of various terms as clinical concepts, such as sadism and masochism, particularly following the book's translation into English. Havelock Ellis, an English medical doctor, published the work *Sexual Inversion* in 1897, the first English-language textbook engaging with the topic of homosexuality, and six volumes of *Studies in the Psychology of Sex* between 1897 and 1910. Magnus Hirschfeld, together with Iwan Bloch and Albert Moll, are credited with conceptualizing "sexology" formally as a new scientific discipline. Hirschfeld was a further key figure, not just for his writings but for founding the Institut für Sexualwissenschaft (Institute for Sex Research) in Berlin. The institute operated from 1919 until 1933, when its library was ransacked and burned by the Nazis. This illustrates how supposedly "objective" scientific research does not only contain contemporary political and social values but also is sharply subject to them. To put it differently, while the ways researchers of sex frame their topics of interest (e.g., as "perversions") will be informed by their beliefs and social contexts, the values held by those with power will also shape what research is possible. In general terms, this may be through influencing popular opinion, limiting funding, passing legislation, or, as in this case, violence.

The early work of these researchers included many topics that would be of central importance to sexologists over the course of the 20th century. The emergence of new terminology to capture particular sexual practices (such as *homosexual* and *transsexual*) had several outcomes. The first was to allow for clearer communication of research interests and agendas, as different researchers had come up with different names for broadly the same phenomena. Second, the gradual arrival of terms into popular knowledge created new possibilities for identity formation, although the ramifications for community organization mostly came later. Third, the capturing of these phenomena as psychosexual disorders or "perversions" constructed those phenomena as deviant relative to social norms, as pathology requiring treatment, and special attention to causation. A major topic of early interest was "perversions," now termed *paraphilias,* or sexual arousal to "atypical" stimuli. For the majority of the 20th century, this included any non-heterosexual desire or identity but also virtually any non-procreative sexual practice. Early highlighted topics (sometimes by a range of technical names that have not persisted) included asexuality, hypersexuality, sadism, masochism, crossdressing, exhibitionism, voyeurism, pedophilia, autoeroticism, and necrophilia.

There was variation in the beliefs and approaches that different sexologists took to their topics of research. For example, Richard von Krafft-Ebing regarded non-procreative sexual activity to be a perversion of a natural order, while Magnus Hirschfeld, who was gay (to use contemporary language unavailable at the time), argued that homosexuality was a natural manifestation of human sexuality. While positions could differ on whether the articulation of particular sexual behaviors was "disordered" or not, sexologists shared a sense that through the application of scientific inquiry, a taxonomy (labeling system) of sexual behaviors/"disorders" was possible, together with understandings of causation and suitable treatment.

Scientific or clinical scholarship of human sexuality has been a key topic across a range of academic disciplines. This can blur the boundaries of which publications are considered sexological and which scholars are considered sexologists. Examples of academic journals that are sexologically focused include the *International Journal of Sexual Health* (the official journal of the World Association for Sexual Health, formerly the World Association for Sexology), the *Journal of Sex Research* (produced by the Society for the Scientific Study of Sexuality), the *Journal of Sexual Medicine* (the official journal for the International Society for Sexual Medicine), and *Archives of Sexual Behavior* (the journal for the International Academy of Sex Research). Journals

of adjacent relevance but with inclusion or emphasis of social scientific methods include the *International Journal of Transgender Health* and *Sexualities*.

Outside of biological and psychiatric contexts, cross-cultural study of sexuality was important in the work of anthropologists such as Margaret Mead and Bronisław Malinowski in the first half of the 20th century, while sexological work also influenced the development of psychoanalysis by Sigmund Freud. These examples certainly diverged from classical sexology methodologically, although psychologists and psychiatrists influenced by Freud (or the analytic psychology of his colleague Carl Jung) would shape the conceptualization of sexual disorders and behavior over the 20th century, in parallel with sexologists such as Alfred Kinsey, William Masters, Virginia Johnson, and Harry Benjamin. Kinsey's most famous works on sexuality are collectively known as *The Kinsey Reports*. These generated great controversy for addressing taboo sexual topics, and while they have been methodologically criticized, the central ideas of diversity in sexual practices being more common than generally believed, the idea that women are less sexually active than men, and sexual orientation being a spectrum rather than a binary (the "Kinsey Scale") are ideas that have endured in the popular imagination. The sexological research by Masters and Johnson was groundbreaking in that rather than the interviews Kinsey's work was based on, they directly observed sexual acts in the laboratory setting. This included gay and lesbian partners, as well as identified phenomena including the (cisgender male) refractory period for orgasm and physiological indistinguishability of orgasms caused by clitoral versus vaginal stimulation. Their work significantly influenced talking therapy for heterosexual couples with a sexual problem. However, their eponymous research foundation also operated conversion therapy between 1968 and 1977, offering "treatment" for homosexuality. Homosexuality was only removed from the list of mental disorders in the American Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders* (*DSM*) in 1973, yet "ego-dystonic" homosexuality—where the orientation causes distress and a desire to change—was to remain in the *DSM* until the revised third edition of 1987.

Sexology and Trans

During the 19th and the early 20th centuries, a clear distinction between the concepts of sexual orientation and gender identity had not been made. For example, while different terminology was being coined for various sexual phenomena in an overlapping manner, Krafft-Ebing used *sexual inversion* to refer the idea of a "feminine essence" within men and vice versa. "Inverts" were analogous to "homosexuals" in one sense but to "transsexuals" in another, through the use of an internal sex/gender concept being in disalignment with external appearance. The earliest examples of individuals we would now describe as trans were accessing support to facilitate social and medical transitions before the terminology of *transsexual* was widespread. Hirschfeld coined *transvestite* in 1910, which did not distinguish well between individuals articulating gender identity as opposed to crossdressing for sexual gratification. While Hirschfeld used *Transsexualismus* in German from 1923, the American sexologist David Cauldwell is credited with using *transsexual* in English in 1949.

Harry Benjamin was arguably one of the most influential post–World War II sexologists as pertains to trans people, due to his publication of the 1966 book *The Transsexual Phenomenon*. In it, he created the *Sexual Orientation Scale* (later, the Benjamin Scale), which approximated the intensity of gender dysphoria—with "transvestite (pseudo)" at one end of the scale and "transsexual (high intensity)" at the other. He had begun assisting trans people in the late 1940s (with an initial referral coming from Kinsey), before hormonal or surgical interventions were more generally available, since the standard psychiatric approach was to practice conversion therapy. The Harry Benjamin International Gender Dysphoria Association (HBIGDA) was founded in 1979, changing its name to the World Professional Association for Transgender Health (WPATH) in 2007.

Over the 20th century, multiple typologies of trans experience were constructed from psychoanalytic and sexological perspectives, particularly on the basis of sexuality. The majority of this work has not stood the test of time and has been problematized by a range of academic and grassroots community voices for making stigmatizing, psychopathologizing assumptions about trans

experiences and identities. Such work focused overwhelmingly on trans women and contributed to the long-time norm that individuals were only "suitable candidates" for gender-affirming medical interventions if they would be socially legible as heterosexual following transition. For example, Ray Blanchard's typology of "transsexualism" specifically delineates trans women as either "homosexual transsexuals" or "autogynephilic transsexuals" on the basis of attraction—to men, or themselves as women, respectively. The motivation for access to gender-affirming medical interventions is thus framed in terms of sexual gratification. Somewhat similarly, Ethel Person and Lionel Ovesey conceived of "primary and secondary transsexualism," where the primary group were considered asexual, while the secondary group collectively comprised trans women attracted to men and trans women attracted to women (who would be delegitimized as "tranvestitic transsexuals"). While some sexologists have been remembered as deeply sympathetic to trans people and facilitators of early access to medical interventions (most notably Hirschfeld and Benjamin), psychopathologizing assumptions have troubled the usefulness and benevolence of the field among some trans people and their allies.

The Present Day and Critical Sexology

As (dominant Western/Euro-American) values regarding gender and sexual behavior have shifted between the 1950s and 2020s, so too have the goals of sexological research and the values held by sexologists. An early example would be efforts to replace the moralistic term *perversion* with *paraphilia,* led by sexologists such as John Money. Criticism from across the social sciences (such as sociology, social psychology, gender studies, and trans studies) has argued that the construction of clinical typologies and diagnostic designations not only modulates power dynamics between different "types" of practitioners and their patients but also constructs and reinforces binaries of "normal" versus "abnormal" sexual experiences and interests. In the fifth edition of the *DSM,* paraphilias are distinguished from paraphilic disorders, where the latter are defined as causing distress, harm, or risk of harm. Questions may still be raised about how harm may be defined or operationalized, particularly in relation to practices such as sadomasochism.

The increasingly recognized value of qualitative methodologies and theoretical consideration (in fields such as bioethics) has seen attempts to integrate and update sexology with a broader, interdisciplinary remit. Charles Moser, for example, has critically engaged with how categories of "mental disorder" are produced or removed, particularly regarding conceptualization of paraphilias. The critical sexologist might ask why erotic asphyxiation, for instance, would fulfill a diagnosis of Paraphilic Disorder Involving Solitary Behaviour or Consenting Individuals in the 11th edition of the *International Classification of Diseases* (ICD) due to the risk of injury, yet an enjoyment of extreme sports does not similarly render an individual "diagnosable" with a mental disorder. Contemporary sexology uses (broadly) scientific methods to try and answer research questions pertaining to human gendered and sexual behaviors and sexual functions. Critical sexology further engages with how and why these questions are being conceived and answered.

Sexual Configurations Theory, Inclusion of Trans People

Sexual configurations theory (SCT) is a trans-inclusive theory, model, and measure of gender/sex and partnered sexuality that destabilizes ideas of universal gender truths and recognizes individuals' authority to self-define. SCT makes space for binary and nonbinary trans existences and provides a visual medium for trans people and their partners to communicate their genders and/or sexualities with or without identity labels for themselves or others. It was published in 2015 by Sari van Anders and is rooted in trans lived experiences and scholarship, feminist and queer approaches, and marginalized and majority gender and sexual experiences. This entry summarizes the concepts in SCT and explains their relevance to trans understandings and experiences of gender, sex, and sexuality.

Gender/Sex and Trans People in SCT

Most academic measures of gender/sex tend to be built on a cisnormative sex binary. They presume that women have sex characteristics tied to femaleness, like vulvas and vaginas, and were designated girls on this basis and that men have sex characteristics tied to maleness, like penises and scrotums, and were designated boys on this basis. SCT does not make these presumptions. It focuses on sex diversity and gender diversity, so that people of any gender/sex can represent themselves, including people who are questioning or in a process of becoming. In SCT, sex refers to bodily and/or evolved physical features of femaleness, maleness, and sex diversity, and gender to sociocultural aspects of masculinity, femininity, and gender diversity, although people can also self-define these terms in ways meaningful to them. SCT attends to both gender and sex unlike mainstream approaches that privilege sex over gender or approaches that erase sex for gender.

SCT uses the term *gender/sex* as an umbrella for gender and/or sex. Gender/sex can also refer to whole identities like woman, man, nonbinary, genderqueer, or specific features that can involve sociocultural and/or bodily aspects. On its visual models, SCT makes room for trans individuals to indicate how gender/sex matters to them in self-defined ways. For example, in SCT, one trans man might note that his sex is now male and was assigned female at birth. Another trans man might note that his gender/sex is "man" and his sex is "female." Another trans man might note that his body has always been male and that a different birth assignment of gender/sex does not overrule his self-knowledge. In empirical research using SCT's diagrams, trans and/or nonbinary participants reported appreciating the autonomy within SCT to define the relative scope and boundaries of gender, sex, and gender/sex.

SCT offers another tool useful for trans people: gender/sex strength. Instead of presuming that gender, sex, or gender/sex are all equally important or important at all, SCT makes space for people to indicate the degree of importance. People can thus show the importance or irrelevance—from 0% to 100%—of any aspect of gender/sex. This allows people to center gender/sex or decenter it, as meaningful to them.

Branched and Coincident Gender/Sex in SCT

SCT makes space for trans self-definition and autonomy in ways that academic theories of gender/sex and sexuality rarely do. It also offers the value-neutral terms *branched* for when gender, gender/sex, and sex may not coincide (e.g., for someone who is a feminine woman with some male and female sex aspects) and *coincident* for when they do. These terms matter because researchers and others often use different terms in ways that pathologize branchedness and valorize the coincidence common for cisgender people.

Branching can happen in other dimensions as well, including over time. Temporal branching can be useful for trans people who want to discuss their gender/sexes as multiple, changing, and/or transitioning over time. For example, someone might indicate with SCT that they went through childhood as a boy and socially transitioned in early adulthood to the young woman they are. Gender/sex can also branch between ideal and current, in ways that relate to pain, power, and oppression. For example, a nonbinary trans person might indicate that, ideally, they do not want others to read them as a woman or a man, but presently most strangers treat them as a man. And, gender/sex can branch by context and power. For example, a trans woman may be able to present in butch ways with close friends but feel pressured to present in feminine ways in work contexts because of transmisogyny.

Partnered Sexuality and Trans People in SCT

Sex binaries are implicated in sexualities too, via terms like *heterosexual* and *homosexual*. These presume that people are either women or men attracted to women and/or men. Accordingly, most sexuality measures require that a person has a binary sex and that the people they are sexual with, or sexually attracted to, also have a binary sex. Many trans and/or nonbinary people, and others attracted to or partnered with them, have criticized this, since it can invisibilize their gender/sexes and their sexualities. SCT does not require individuals or the people they are attracted to or partnered with to have cisnormative binary sex or binary sex at all.

SCT describes two aspects of partnered sexuality. *Gender/sex sexuality* refers to the gender/sexes of whom people are attracted to and partner with (including none): for example, women who challenge cisgender norms, femmes, people of all genders, and agender people. This is key for trans folks, binary and nonbinary, since many academic approaches define trans sexualities on the basis of birth assigned sex and ignore gender/sex diversity. *Partner number sexuality* is the number of partners a person has or wishes to have: for example, none, one, or more than one as with consensual nonmonogamy. SCT makes room for other sexualities, like kink. And, it acknowledges sexuality can branch or coincide into "nurturant" or "erotic" aspects.

Sexual Diversity Lens

SCT introduces a "sexual diversity lens" that thinks from the margins and considers general and particular features of socially located groups and individuals. This allows for people to study diversity within trans and others' experiences that attends to power dynamics, avoids inaccurate generalizations, and allows for shared understandings. For example, researchers could explore the specificities of trans experiences for binary women or men, men or women outside binary norms, or nonbinary people while attending to cisnormative oppressions common among these different groups but not flattening diversity of experiences. And, researchers could explore overlaps and differences between trans and intersex individuals, like oppressive but starkly differing experiences with medical authority.

Sexual Fluidity

Sexual orientation is a term that is broadly applied to refer to both sexual and romantic interests. As a multidimensional construct, sexual orientation encompasses three aspects: sexual attraction, sexual behavior, and sexual identity. It is important to note that not all three of these dimensions have to coincide, nor should they be expected to. Sexual fluidity is the idea that an aspect of a person's sexual orientation (i.e., attraction, behavior, identity) changes or fluctuates over time. Sexual fluidity is relevant to understanding the experiences of trans people.

Sexual identity specifically references how an individual understands their own sexuality, which can be communicated to others by the use of sexual identity labels. Traditional sexual identity labels are dependent on a conceptualization of gender identity as both binary and static across time. For example, traditional sexual identity labels (e.g., heterosexual, lesbian, and bisexual) reference the relation between an individual's gender identity (e.g., male and female) and the gender identities of those to whom the individual is attracted. In this way, sexual identity labels and gender identity labels are inextricably linked, such that one's sexual identity may imply to others one's gender identity. Because of the narrow cisnormative assumptions communicated by traditional sexual identity labels around gender as being both binary and static, sexual fluidity presents unique considerations for understanding trans people's experiences.

Sexual Fluidity

Psychologist Lisa Diamond introduced the concept of sexual fluidity after studying the lived experiences of cisgender (cis) women who were predominantly sexual minorities (i.e., lesbian and bisexual). Over years of research, Diamond observed that sexuality was not experienced as a fixed concept but instead was naturally responsive to evolving intrapersonal and interpersonal contexts across an individual's development and life span. As such, Diamond asserts that sexual fluidity represents shifts in the directionality of one or more dimensions of sexual orientation over time. These shifts can be represented as changes in sexual identity label, attractions, social sex role, gender identity, or sexual responsiveness. Inherent within the definition of sexual fluidity is the idea that sexual orientation does not rigidly predict an individual's sexual desires consistently over time. Diamond's model of sexual fluidity details that as an individual shifts in one area of life, internal factors (i.e., thoughts, hormones, beliefs) can have a direct effect on external factors (i.e., relationships, interactions, community), resulting in a change in the experience of sexuality. Overall, this model has been used to understand changes in sexuality as a natural process that develops across the life span.

A limitation of Diamond's initial work was the singular focus on the experience of sexual-minority cis women. In response, others have extended the research on sexual fluidity to document its natural occurrence among cis men and trans individuals. Diamond's model of sexual fluidity can be readily applied to trans individuals as they develop their understanding of gender. Trans individuals frequently endorse sexual fluidity as it is expressed through fluctuations in both identity and attraction. Therefore, sexual fluidity among these individuals is most often the result of three situations unique to having a trans identity. First, the shifting of gender identity labels during transition may result in subsequent changes to sexual identity labels; second, through fluid gender presentations and attractions that may best be captured through the use of a queer identity label; and third, through the experience of gender affirmation, which allows previously ignored or unrecognized attractions to become realized.

Shifting of Gender Identity Labels

The first way in which sexual fluidity of trans individuals may be understood is through the shifting of gender identity labels. Traditional sexual identity labels are dependent on a binary

gender identity that is considered static across time. In this way, sexual identity labels and gender identity labels are dependent on one another and inform the way in which identity may be understood and socially negotiated. For example, if a cis man identifies as heterosexual, then others are likely to infer that he is attracted to women. Similarly, if an individual uses a sexual identity label of lesbian, then others are likely to infer that she identifies as a (cis) woman who is attracted to other women. This idea of sexual identity as being linked to gender identity is problematized among trans individuals whose gender is transgressed or made null.

When trans individuals progress through a social transition, they begin to express a gender identity that is different from the one they were assigned at birth. This evolving gender identity may render their current sexual identity label inaccurate. For example, if an individual who is attracted to women no longer identifies as a woman, then the label of lesbian may no longer fit with their experience. Since trans individuals choose a sexual identity label that is reflective of their gender identity and not their sex assigned at birth, trans individuals often report experiencing multiple changes to their sexual identity label across their lifetime.

Furthermore, societal readings of an individual's gender can affect sexual identity and the adoption of new sexual identity labels. For example, a transmasculine individual who is attracted to men may have understood their sexual identity to be heterosexual prior to transitioning. However, with transition and recognition of their male identity, they may now be read by society as a gay man. Thus, while this individual may not have internally switched their sexual identity or attractions, society now reads their identity differently. Therefore, as trans individuals shift their gender identity label, a corresponding shift in sexuality identity may be undertaken. As such, trans individuals' sexuality can be viewed as fluid, although their sexual attractions and behaviors might not actually have changed.

Fluidity in Identity

A second way in which sexual fluidity among trans individuals may be understood is through fluidity in identity. For nonbinary individuals in particular, who often experience fluidity of their gender, traditional categories of sexual identity are wholly inapplicable. *Nonbinary* is a broad identity term that can include individuals who view their gender as existing outside of binary conceptualizations of man or woman, individuals who view their gender as a combination of genders, or individuals who view their gender as fluid and without constraints or borders. For these individuals, sexual identity labels such as lesbian, gay, or heterosexual do not work, as they require the individual to endorse a binary gender identity. In response to the limitations of binary-focused sexual identities, the identity label *queer* has become increasingly used.

Queer as a sexual identity is distinctly different from other plurisexual labels such as *bisexual* or *pansexual*. The historical roots of queer identification involve a rejection of mainstream culture and an endorsement of nonnormative expressions of sexuality and gender. These radical roots are evident today with individuals using the term to distance themselves from both a binary gender identity and binary attractions. Furthermore, the sexual identity of queer is used by some to represent their sexual fluidity. Queer-identified individuals have been shown to have sexual attraction, romantic attraction, and sexual behavior that are fluid across time and context.

In alignment with Diamond's sexual fluidity model, individuals with fluid gender identities would express more fluidity in their sexuality as they oscillate through gender expressions or identities. Research has begun to support this claim, demonstrating that instances of gender fluidity are often accompanied by sexual fluidity, in terms of changes in sexual and/or romantic attractions and in the use of sexual and gender identity labels. However, it is not just nonbinary trans individuals who experience fluctuations in their sexual attractions; similar fluctuations are seen among binary trans individuals as well. Several studies have found that trans individuals are more likely to use a queer identity label as well as to report changes in sexual and/or romantic attraction over time. Thus, trans individuals are using *queer* not only to escape binary constraints but to express the fluidity of their sexual attractions as they transition across gender identities.

Gender Affirmation

A third way in which sexual fluidity among trans individuals may be understood is through the process of gender affirmation. Gender affirmation refers to a process by which an individual engages with medical interventions, such as hormone replacement therapy (HRT) and gender affirmation surgeries, to allow for the acquisition of secondary sex characteristics that are more congruent with an individual's gender identity. It can also refer to the interpersonal process by which society begins to read the individual as their gender identity and interact with the individual according to societal scripts for that gender. Prior research has found a connection between HRT and shifts in sexual attraction. These studies have shown that transmasculine individuals who have begun testosterone therapy are more likely to experience a shift in sexual attraction than those who have not. However, this is not to say that testosterone creates a change in sexual attraction but rather that testosterone increases the experiences of interpersonal gender affirmation, which translates into increased sexual exploration. This societal affirmation that follows increased bodily gender congruence results in the individual feeling more comfortable in exploring what it means to be their gender and what it means for their sexuality.

Transmasculine individuals have reported that prior to being affirmed in their gender identity, they were hesitant to explore attractions to certain individuals for a fear of being misgendered or treated in a way that did not align with their gender identity. These same individuals explained that after undertaking HRT or gender-affirming surgeries, they began to be read more easily as their affirmed gender and were able to safely explore new aspects of sexual attractions or sexual experiences. Other transmasculine individuals reported that being affirmed in their gender opened sexual attractions they had not previously experienced. Regardless if the shift in sexual attraction was expected or not, trans individuals view the shift as resulting from the experiences of gender affirmation.

This fluidity in sexual attraction resulting from the experience of gender affirmation is reflective of Diamond's model, where the individual experiences a change to societal inputs, which results in a change to their sexual attractions. While it can be hypothesized that HRT could have a similar effect on the sexual attractions of trans women, there is a paucity of research in this area. Additionally, there is a need to explore the effects of gender affirmation on sexual attraction within nonbinary populations as well.

Sexual Health

Sexual health can be defined as a state of physical, emotional, mental, and social well-being in relation to sexuality and not merely the absence of disease, dysfunction, or infirmity. For transgender and gender-diverse (trans) people, who account for 0.4% to 0.6% of the adult population, the concept of sexual health is complicated by the fact that some may experience distress due to having physical characteristics, including genitals, that do not align with their gender identity. Sexual health in trans people is understudied and mostly studied in its relation to HIV risk and sexually transmitted infections (STIs). Much of the available sexual health research is focused on women who were assigned male at birth (transgender women, trans women, or women of transgender experience). Few studies related to sexual health have been conducted in men who were assigned female at birth (transgender men, trans men, or men of transgender experience), and even fewer among those who identify outside the gender binary of male or female such as gender nonbinary, genderqueer, gender-nonconforming, or gender-fluid people who account for about one third of trans people. This entry reviews what is currently understood about sexuality, sexual health, sexual health promotion, and care of trans individuals.

Sexual Orientation and Gender Identity

In the 2015 U.S. Transgender Survey (USTS), which surveyed over 27,000 trans people, sexual orientation identities among trans people were found to be diverse. Respondents predominantly identified as queer (21%), pansexual (18%), gay/lesbian/same-gender loving (16%), bisexual (14%), or asexual (10%); however, these identities on their own do not provide information on sexual risk. Sexual orientation is multidimensional and is considered to have three main domains: sexual attraction, sexual behavior, and self-identification. Although there are best practices on how to construct questions that capture all three domains, many research studies only include self-identification (e.g., lesbian/gay, straight, or bisexual) as the measure of sexual orientation. Since self-identification may be discordant with sexual behavior, this will not accurately determine or capture an individual's risk for STIs and pregnancy. For trans people, labels for self-identity may be even less relevant because sexual orientation identity may be more fluid over time and may not fit traditional constructs. A trans man who is attracted to men and identifies as gay may have a heightened or lower risk for STIs depending on whether his sexual partners are cisgender (cis) or trans men. For some trans individuals, their sexual attraction may change when they initiate hormone therapy. Clinicians working with trans individuals should be aware of the complexities of assessing sexual orientation and seek to obtain a comprehensive sexual health history that provides information on sexual behaviors and past and current sexual partners, including whether they have sex with cis men, cis women, or other transgender or gender nonbinary people, in order to provide appropriate counseling and screening.

Sexual Health and Gender Affirmation

Some trans individuals may undertake medical interventions (hormones and/or surgery), in addition to social and legal interventions, to improve gender dysphoria and congruence with their gender identity. The use of gender-affirming hormones has effects on sexual function. Trans men who use testosterone may initially experience an increase in libido. Trans women who use estrogens and androgen blockers may experience with low sexual desire and loss of erections. The results from a multisite prospective study suggest that these changes in libido are temporary and that for both trans men and women, sexual desire returns to baseline levels over time.

The incidence of gender-affirming genital surgeries conducted in the United States has increased in the past decade, and clinicians are more likely to encounter postoperative clients who have sexual health concerns related to surgery. In the USTS, only 12% of trans women had undergone vaginoplasty surgery, although about half were

interested in future surgery. Because most trans women have not had gender affirmation genital surgery, they may engage in insertive oral, vaginal, or anal sex using the penis as well as receptive oral or anal sex. The surgery to create the neovagina (vaginoplasty) frequently uses penile and scrotal skin; however, other techniques may incorporate peritoneal or urethral tissue. Less commonly, the neovagina is constructed using intestinal tissue or split-skin grafts.

Trans women who undergo vaginoplasty surgery may experience a loss in sexual desire, with about one in five meeting criteria of hypoactive sexual desire disorder (HSDD). Some of the dissatisfaction of trans women may be related to low testosterone levels occurring after gonadectomy or to the lack of lubrication seen in skin-lined neovaginas. In general, however, satisfaction with function, pleasure, sensation, and ability to achieve orgasm is high. Complications after vaginoplasty, such as vaginal stricture and pain, may reduce sexual satisfaction.

Some of the sexual function scales have not been validated in trans people. For example, the Female Sexual Function Index (FSFI) includes a lubrication score. Because split-skin or penile-inversion vaginoplasty does not allow for lubrication, this may result in higher rates of measured sexual dysfunction.

Trans men may undergo gender-affirmative genital surgeries, such as metoidioplasty or phalloplasty to create a neophallus. The USTS found that only 5% of trans men participants had undergone one of these surgeries. Since they may have undergone other related procedures, such as hysterectomy, oophorectomy, scrotoplasty, or vaginectomy, clinicians need to get a detailed surgical history to determine what organs are still present and the impact on cancer screening and sexual health screening. An example is an individual who had a metoidioplasty but may or may not have had a hysterectomy, vaginectomy, and/or urethral lengthening, a procedure that allows voiding while standing up. This will affect whether they require cervical cancer screening, have potential for pregnancy, or require vaginal versus urine-based screening for STIs. Fewer studies have been undertaken in trans men who have had gender-affirming genital surgery; however, sexual satisfaction appears to be high, and rates of HSDD are much lower compared with trans women unless they are dissatisfied with the phalloplasty results.

Sexually Transmitted Infections

Data on STIs among trans people are limited due to the lack of consistent reporting of surveillance data that includes gender identity. Trans women, especially trans women of color, have unique vulnerabilities to HIV and other STIs due to multilevel stigma, resulting in high rates of sex work, condomless anal receptive sex, sex with substance use (“chem sex”), early sexual debut, and increased number of sexual partners. Less is known about trans men; however, studies have also demonstrated risk factors such as sex work, substance use, condomless sex with cis men, and low rates of STI screening. Recent studies have demonstrated that trans women have an elevated prevalence of HIV infection, both in the United States (14%) and internationally (19%), and HIV incidence often exceeds that of cis men who have sex with men (MSM). Trans women of color have disproportionate HIV risk with prevalence higher among Black (44%) and Hispanic/Latino (26%) trans women (Becasen et al., 2018). Fewer estimates exist for trans men; however, a recent metanalysis found a lab-confirmed HIV prevalence of approximately 3%.

There are few data on sexually transmitted infections other than HIV in trans people; however, prevalence of bacterial STIs, including *Neisseria gonorrhoeae* (GC), *Chlamydia trachomatis* (CT), and syphilis, in trans women has been found to be equivalent to, or higher than, rates among cis MSM. Viral STIs, including human papillomavirus (HPV) and hepatitis B and C, have also been reported among trans women at high rates. STI risk factors in trans men are highest among those who have sex with cis men. In some studies, trans men were found to have similar rates of GC, CT, and viral hepatitis compared with trans women. A recent study that used data from the Sexually Transmitted Disease (STD) Surveillance Network and obtained STI prevalence among 506 trans women and 120 trans men demonstrated extragenital CT and GC infections in 16.8% and 15% of trans women and 14.3% and 12.1% of trans men, respectively. Urogenital CT and GC infections were higher in trans men, 4.1% and

7.1% versus 0.2% and 2.8%, respectively. There are few data on STIs for gender-diverse people, although one health center found STI positivity among cis MSM, trans women, trans men, and nonbinary people to be 35%, 25%, 13%, and 26%.

No large studies have reported on STI prevalence among trans people who have had gender-affirming genital surgeries. There are a handful of case reports describing neovaginal STIs, including herpes simplex, HPV/genital warts (in penile-inversion vaginoplasty), *Neisseria gonorrhoeae,* and *Chlamydia trachomatis*. If the vaginoplasty used an intestinal graft, there may be a risk of other diseases such as inflammatory bowel disease, adenocarcinoma, diversion colitis, and adenomatous polyps that can cause vaginal discharge or pain.

STI Screening

Data indicate trans individuals are less likely to undergo STI screening compared with cis individuals. Trans men are less likely to undergo cervical cancer screening, and all trans people have lower rates of HIV screening compared with cis MSM. Trans individuals face multiple socioeconomic and structural barriers to care that negatively affect health care utilization and result in missed opportunities for HIV and STI prevention services. The USTS documented high rates of health care avoidance, even for urgent care needs, due to actual or fear of health care discrimination.

Reproductive Health Services

Trans people are often not considered during implementation of reproductive health services, including fertility preservation, contraception, and pregnancy termination services. Trans people at risk for pregnancy may be unaware of, or not be interested in, contraception options or may mistakenly think that testosterone prevents pregnancy. Other barriers to reproductive health care include providers who lack knowledge of the sexual and reproductive health needs of trans patients and environments that are not welcoming, including use of incorrectly gendered language (e.g., the assumption that users of contraception or people who are pregnant are always women). Patients may avoid oral contraceptives due to a fear these will negatively affect testosterone or not wish to take additional estrogens. Trans people should be advised that testosterone does not reliably prevent ovulation and that trans men on hormones may still get pregnant. Trans people with capacity for pregnancy should be offered reliable contraceptive methods, including long-acting reversible contraceptives (LARCs), such as intrauterine devices (IUDs) or subcutaneous implants.

Best Practices to Improve Sexual Health Screening

Providing an environment that is welcoming and inclusive of trans individuals is key to improving patient experiences and engagement in sexual health screening. The U.S. Centers for Disease Control and Prevention (CDC) STD Guidelines includes a section on special populations that indicates that providers should screen for STIs based on anatomy and sexual behaviors, but the guidelines do not provide detailed advice on how to take a sexual history or perform an exam in trans patients.

The sexual history should not assume sexual behaviors, sexual identity, or gender of sexual partners. The history will also need to obtain information about any surgeries undertaken that could affect acquisition or screening of STIs. There are several suggested ways of obtaining a sexual health history, including the CDC's Taking a Sexual History. A modified risk assessment is included in Table 1.

Table 1 Sexual Risk Assessment

Topic	*Appropriate Questions to Ask*
Pronouns	What are your pronouns?
Partners	What are the genders of your partners? How many sexual partners in the last 12 months?
Parts	What words do you prefer to use for your body parts? Have you ever had any surgeries or other procedures?

Practices	What kinds of sex are you having? Which behaviors might expose you to your partners' fluids?
Protection	How do you protect yourself against STIs?
Prevention of pregnancy	Are you using contraception? Are you concerned about pregnancy?
Past history of STIs	Have you ever been diagnosed with an STI?
Prevention of HIV	Prior or current use of preexposure and postexposure prophylaxis

Source: Authors.

For those who have had gender-affirming genital surgeries, the date and type of surgery should be documented, as well as any postoperative complications. For those who have had neovaginal surgery, providers can ask about dilation frequency, dilator size, pain, discharge, bleeding, and problems with urination and sexual intercourse.

When conducting the physical exam, providers should be mindful that many trans people have experienced past sexual violence, including child sex abuse. This, in addition to underlying gender dysphoria, can result in trans patients finding the physical exam stressful and may even provoke triggering flashbacks. All patients should be screened about prior sexual trauma. Using a trauma-informed care approach is one way to promote resilience through the principles of safety, trustworthiness, transparency, cultural sensitivity, collaboration, and empowerment. Providers can create a gender-affirming environment through consistent use of correct name and pronoun(s). The reason for and format of the exam should be explained while the patient is dressed and permission requested in order to proceed as well as the fact that the exam can be stopped at any point on their instruction. Having a chaperone or friend present and asking patients for their preferred terms for body parts can improve sense of trust and safety. Patients should be offered choices, for example, to do a self-collected swab for cervical cancer screening rather than a speculum exam.

Neovaginal exams may be conducted with a small speculum or an anoscope to examine for lesions, ulcers, or discharge. STI screening for gonorrhea and chlamydia using nucleic acid amplification techniques can be done with a vaginal swab or urine collection. Because there is no cervix, screening for cervical cytology is not performed. The prostate can be palpated anteriorly instead of using an anal approach. Transmasculine individuals who have had genital surgery but retained the vagina may have a narrowed introitus. Those who use testosterone may experience vaginal atrophy and discomfort on exam. In both instances, use of a smaller speculum with lubricant may be helpful. Trans men using testosterone may also have a higher frequency of unsatisfactory results.

The comprehensive sexual health encounter offers an opportunity to counsel about interventions such as HIV preexposure prophylaxis (PrEP), postexposure prophylaxis (PEP), emergency contraception, and immunizations (hepatitis A, hepatitis B, and HPV).

Conclusion

Sexual health is understudied in trans people; however, there is evidence they may have elevated risk for STIs but lower rates of screening due to multilevel barriers to health care. Trans people may require the full spectrum of sexual and reproductive health care, including contraception, fertility preservation, and abortion care. Clinicians should be aware of the diversity of sexual identities, sexual partners, and behaviors. The key rule is not to make assumptions and to ensure that a culturally competent and comprehensive sexual history is

obtained. Engagement in sexual health may be improved by using a trauma-informed approach.

Sexual Violence

Sexual violence is a significant human rights and public health issue, with negative consequences for health and well-being. Definitions of sexual violence may include sexual assault; forced sexual activity perpetrated by intimate partners, strangers,

or individuals known to a person and sexual harassment; and unwanted behaviors that make people feel uncomfortable because of their sexual nature and that serve to offend, humiliate, or intimidate. Sexual violence is not a reflection of sexual desire; it is a hostile and aggressive act, most commonly perpetrated by men against women, reflecting feelings of anger and hostility toward women, as well as a need to exert power and control. As such, sexual violence is grounded in misogyny, gender-based discrimination, and inequality. Rates of sexual violence are higher in the transgender population compared with the cisgender population and contribute to higher rates of depression, anxiety, and suicidality reported by trans people.

Rates of Sexual Violence in Trans Populations

Sexual violence is underreported, with barriers to disclosure and differences in operationalizing what sexual violence is resulting in prevalence rates being significantly underestimated. However, international research indicates that trans people experience a significantly increased risk of physical and sexual assault. Across studies, around 50% of trans individuals report sexual violence, compared with around 10% of the cisgender (cis) population. Trans individuals also experience high rates of verbal and physical sexual harassment, which has been directly linked to their transgender status.

Across cultures, sexual violence experienced by trans people includes verbal and physical sexual harassment and sexual assault. Sexual violence experienced by trans people is grounded in misogyny and gender-based discrimination, as well as transphobia and homophobia, described as transmisogyny. It has been argued that non-trans people have a sense of entitlement about trans bodies, often associated with fetishization, which may be a contributory factor in sexual harassment and assault. LGBTQ people who are more visibly “out” or identifiable are more likely to experience violence. There is strong evidence that visibly appearing different heightens the risk of physical and sexual violence for trans people, with the period during and after gender affirmation a time that trans people are at highest risk of sexual violence. This leads to the conclusion that sexual violence, or the threat of violence, serves as gender policing.

Successive reports by the National Coalition of Anti-Violence Programs indicate that trans women experience lifetime prevalence of sexual violence at rates significantly higher than all other groups in the broader LGBTQ community. However, a number of studies have suggested that sexual violence is more prevalent among trans people assigned female at birth, compared to those assigned male at birth. For example, in a 2019 survey of trans and gender-diverse Australians in which 53.2% reported sexual assault compared to 13.3% of the broader Australian population, lifetime rates were 61.8% for trans men and 39.3% for trans women. Another 2007 study reported that 35% of trans men living in the U.S. state of Virginia had been sexually assaulted, compared with 23% of trans women. Conversely, in a 2005 study conducted in the U.S. state of Pennsylvania, 69% of trans women reported having experienced forced sex, compared with 30% of trans men. It is not clear why these findings are different across U.S. states; however, it is widely recognized that sexual violence often follows verbal violence and may be accompanied by physical violence. The primary perpetrators of sexual violence against trans people are family members, predominantly male, and other known people. Intimate partners are also responsible for significant rates of sexual violence and abuse against trans women, as are clients of those engaged in sex work. There is some evidence that trans women are more likely than cis women to be sexually assaulted by a stranger.

Intersecting Identities: Gender, Sexuality, and Ethnicity

Trans individuals who are lesbian, gay, bisexual, or queer (LGBQ) may be vulnerable to sexual assault or harassment on the basis of the intersection of gender and sexuality diversity. LGBTQ people are significantly more likely to experience physical and sexual assault, sexual harassment, and for the perpetrator of sexual violence to be a stranger than exclusively heterosexual people.

Trans people of color face discrimination and violence on the basis of the intersection of their gender and racial identities. For example, the largest transgender survey to date in the United States, the 2015 United States Transgender Survey (USTS), found lifetime prevalence rates of sexual

violence at 45% for white participants compared with 53% of Black, 58% of Middle Eastern, 59% of multiracial, and 65% of Indigenous participants. Sexual violence is often accompanied by other acts of physical violence, with trans people significantly more likely than cisgender people to experience physical violence and murder. Trans women make up 8.6% of the LGBTQ community in the United States but constitute 44% of total murder victims. The majority of trans people who are murdered are women of color, poor women, and/or sex workers, with many murder victims being all three categories. This reflects the layers of racial and transphobic aggression experienced in everyday life by trans people of color and has led to the plea to centralize race and social class as well as gender when attempting to understand sexual and physical violence against trans people.

Sex Work and Sexual Violence

Engagement in sex work is a common experience for trans people, providing financial security, independence, and a sense of community among sex workers. Sexual violence is a common experience for sex workers, with trans women sex workers at higher risk, attributed to male clients' self-loathing and rejection of the trans woman after sex. As such, many trans women are subjected to a pervasive and very real threat of danger in the pursuit of their basic survival. International research indicates that irregular, low, or negligible condom usage with clients and partners of trans sex workers is not uncommon and is often accompanied by threats of violence or the threat of withholding money, food, or shelter. Additionally, some trans women report being subjected to regular unprotected sexual encounters with police, particularly in contexts where sex work is criminalized, in order to avoid arrest or violence.

Trans women of color are more likely than other trans women to enter and stay in sex work, due to a combination of racism and transphobia, which affects schooling and employment, combined with the impact of immigration restrictions and language barriers. This may be one factor that explains the higher rates of sexual violence reported by trans women of color.

Impact of Sexual Violence

Experiences of sexual violence are a significant contributing factor in the distress and mental health problems reported by trans people. A meta-synthesis of the qualitative literature pertaining to the lived experiences of trans individuals across a range of cultural contexts found a range of physical problems and psychological distress, associated with discrimination, social exclusion, and sexual violence. For example, the first trans mental health study conducted in Australia in 2014 found that trans people were 4 times more likely to experience depression and 1.5 times more likely to experience anxiety disorders compared to the cisgender population. High self-reported rates of depression for trans women worldwide have been explained within a minority stress model, which examines the impact of the chronic stress on LGBTQ people due to stigmatization and violence within a heterosexist and transphobic society. High rates of drug and alcohol misuse are also prevalent among trans populations, especially among those who also engage in sex work, which may partly result from sexual violence that causes posttraumatic distress.

However, many trans people demonstrate agency and resilience in behavioral responses to sexual violence, including naming sexual violence, seeking legal redress, hypervigilance in the public sphere, and the avoidance of men and intimate relationships. Many individuals also adopt a range of positive strategies to make meaning of their experiences and to facilitate coping, including seeking out the positives in their experiences, self-acceptance, prioritizing the self, talking about sexual violence, and seeking support from health care professionals. Some trans women adopt a psychological strategy of rationalization and normalization of violence as a means of defense against the psychological impact of abuse. Some women chose to view sexual harassment experienced as being directed at participants as women as gender affirming.

Positive relationships with a partner, friends, or other trans people can serve as protective factors against distress and facilitate coping when experiencing difficulties in life, including sexual violence. Indeed, trans people who experience sexual violence are not passive "victims" but are survivors of sexual violence.

Professional Support and Acknowledgment

Support from health care professionals can be central to resilience and survival following sexual violence. Support in gender affirmation, through facilitation of access to hormone therapy, reduced the risk of transphobic violence. Some trans people describe positive support from doctors, nurses, and psychologists following experiences of sexual violence. However, others report encountering health care professionals and ancillary staff who are openly transphobic, hostile, and dismissive, or they report having been refused support altogether. Negative experiences with police and the legal system are also experienced by many trans people, who report feelings of judgment, blame, mistrust, and a lack of acknowledgment that sexual violence had occurred. This can include physical and sexual violence from police, revealing a strained relationship between trans people and the police. In combination, this transphobia reinforces the suggestion that sexual violence against trans people is viewed by the health care professionals, the police, and wider society as unproblematic.

Conclusion

Violence against transgender people is a serious issue that has been described as a hate crime. All forms of violence, including sexual violence, against transgender people need to be taken seriously in order to recognize and acknowledge human rights, as well as address this gender-based hate crime.

Trans people are clear that they want the public, health care professionals, and the police to become more aware of sexual violence against trans people, to recognize the specific needs and experiences of trans people of color, and to receive education and training about gender and diversity in order to prevent sexual violence from occurring. Such awareness and education must be accompanied by legislation and policy to address sexual violence experienced by trans people in order to provide protection and support, including visibility and recognition, legal redress, and inclusive language and practice.

Sexualities/Sexual Identities

This entry, focusing primarily on the U.S. context, describes trans sexualities through the discussion of sexual identities, desires, cultural representations, and practices drawn from the work of researchers and from the diverse knowledge and experiences of trans people and their partner or partners (hereafter "partners"). Also discussed are understudied topics in research on trans sexualities, including focus on sexual embodiments, language, social media, dating sites, pornography, and sexual health. Given limited research in this area, the entry concludes with suggestions for future research, underlining the critical need for expanded research on trans sexualities and sexual identities.

Sexual Identities and Cultural Representations

Sexual identities of trans people, much like those of cisgender (cis) people, are complex, are dynamic, and can change or stay the same throughout the life course. Sexualities and sexual identities are understood as socially constructed and reinforced by structural, interactional, and identity processes. As such, trans people and their partners can identify with any sexual identities they choose. Some examples of sexual identities include bisexual, asexual, queer, gay, lesbian, demisexual, and heterosexual/straight. Individuals can self-identify with the same or a different sexual identity as their partners. The 2015 U.S. Transgender Survey reported that out of 27,715 respondents, 21% of respondents identified as queer; 18% identified as pansexual; 16% identified as gay, lesbian, or same-gender loving; 15% identified as straight; 14% identified as bisexual; and 10% identified as asexual. These results provide just one example of how diverse trans people's sexual identities can be.

Embodied changes associated with social and/or medical transition can alter the sexuality of a trans person and their partners. Gender may be considered an interactional practice or cultural exchange that can occur between people through sexuality or sexual practices. For example, after recovering from chest reconstruction surgery, a trans man may want to be touched in different ways that affirm his gender identity and masculinity. These embodied changes can positively or negatively affect the sexualities and sexual relationships of trans people, depending on the dynamics and history of a given relationship. While many trans people experience embodied changes associated with social and/or medical transitioning, many others do not. Frequent communication about feelings and desires is imperative as bodies or expressions change throughout the relationship.

Social scientists are devoting more attention to trans sexualities and identities. Researchers have explored how inequalities persist and challenges arise in trans people's sexual relationships and how sexual pleasure and power often involve identity work and negotiations for trans people. They have also noted how cis people negotiate their sexual identities when dating and forming relationships with trans people.

The sexual behaviors and practices of trans people, just like those of cis people, vary on the basis of both sexual identification and preferences of oneself and one's partners—who may be cis or trans themselves. Historically, the sexual behaviors and practices of trans people have been viewed as problematic or pathological. Very little academic research has been conducted on the specific sexual behaviors and practices of trans people. Mostly, publications on sexual behaviors and practices derive from narrative accounts written and published by trans people and their partners within autobiographies, novels, edited collections, and self-published magazines ("zines"). Many memoirs and novels, mostly written by white trans women, have centered trans experiences in relationships, intimacies, and sexualities. Media representations of trans people and their diverse sexualities are growing, with examples such as Mj Rodriguez in *Pose,* Hunter Schafer in *Euphoria,* Asia Kate Dillon in *Billions,* Trace Lysette in *Transparent,* Ruby Rose in *Batwoman,* Jamie Clayton in *Sense8,* and Theo Germaine in *The Politician.*

Sexual Embodiments

When considering the sexual behaviors and practices in which trans people and their partners engage, it is necessary to understand trans embodiments. As with cis people, there is no one type of body among all trans people. Trans people may engage in various forms of body modification (including but not limited to use of hormones and/or surgeries) that affect sexual interactions. Some trans people who use hormone replacement therapies discuss undergoing a second pubertal period. The effect of hormone replacement therapy on libido varies widely, with some reporting that hormone administration heightens their body's response to sexual stimulation, while others report no effect or even reduced sexual sensation and response. These responses may also shift across time and may be partner or context dependent (as with all people's sexual response).

The initiation of hormone replacement therapy may generate gendered embodiments that may be read as gender ambiguous by others. This transition period may be strongly associated with others misgendering those undertaking hormone replacement therapy, which may produce additional stress for some. Gendered embodiments that include, for example, vocal pitch changes to a midrange, sparse or patchy facial hair, and increased acne may make it difficult for some people to be recognized in accordance with their felt sense of gender and gender identity. Sexual and romantic relationships may be especially affected by these shifts in embodiment and embodied responses to sexual stimulation. Some of these impacts are described as exciting and welcomed, others as stressful and unwelcome.

For those whose gender identity is more aligned with the binary, the passage of time may have a positive impact on hormone replacement therapy. Once hormones have feminized or masculinized the body, individuals often report greater interpersonal and public recognition for their gender and less frequent or even absent misgendering. Gender recognition within the binary, however, is not something all trans people aspire to or have access to. Some nonbinary people report that while hormone replacement therapy may positively affect some aspects of their daily lives, being misrecognized as a man or a woman when their actual gender is nonbinary can be quite disconcerting. Just as among cis people, there is no single way to be, look, or feel like a man, woman, or nonbinary person.

Research also suggests that nonbinary gender expression, or gender expression that is deemed ambiguous by others, may place trans people who are in the early phase of medically facilitated transition in particular danger due to cultural cissexism and transphobia. Western culture simultaneously ridicules, fetishizes, and exoticizes trans embodiments. There are many reports of cis men engaging in homicidal violence against trans women to whom they were sexually attracted. Finding potential sexual and romantic partners who are well informed about trans identity and embodiments and who actively support the rights of trans people may be challenging but necessary for well-being and survival. Many trans individuals in sexual and romantic relationships with other trans people report that shared experiences and understanding cultural oppression toward trans people facilitate relationship formation.

Innovations in Sexual Language, Culture, and Practices

Language holds extraordinary power to shift understandings and interactions in both sexual and nonsexual contexts and the capacity to affirm and support, or stigmatize and oppress, trans embodiments and sexualities. Some terms are already in wide usage (e.g., breasts, chest, vagina, penis) but may simply be used in ways that are intentionally divorced from sex categorization at birth. For example, a trans man or nonbinary person may refer to their *chest* rather than their breasts. A trans woman's or nonbinary person's anus may be referred to (and interacted with) as a *vagina* or *pussy.* Other terms that trans people have created to articulate their sexual embodiments include *front hole* or *bonus hole* to describe the vagina and *dicklet* or *cock* for the clitoris.

Language is not the only way that gender may be explicitly tied to various forms of embodiments and identities. Sexual practices themselves tend to be explicitly and implicitly tied to gender and sexual identities. For example, cultural associations between gay men and anal sex and lesbians and oral sex are quite strong, although members of all sexual identities may engage in these sexual practices. Particular sexual practices may be culturally

coded in ways that make engaging in them uncomfortable for some trans people, notably if they are early in their transitions or broadening their gender expression. However, as individuals become more comfortable in their own bodies or receive affirmation, they may incorporate sexual behaviors and interactions previously off-limits; however, this is not always the case. Some trans individuals hold sexual identities that explicitly involve *no-touch* or *stone* sexual embodiments, wherein a partner's ability to sexually touch or stimulate their bodies may be highly restricted or even fully prohibited.

Trans people and their partners may also shift or broaden previous sexual practices in ways that further affirm trans embodiments. For example, some trans women and their partners practice *muffing* (digital penetration of a trans woman's inguinal canals). Further, some trans women and their partners describe referring to these inguinal canals as *cunts* (plural intentional). A trans woman who has not had bottom surgery may not feel comfortable engaging as a penetrative partner in sexual intercourse or may prefer to use a prosthetic penis if she does. A trans man in a sexual relationship with a woman may become less comfortable with being the receptive partner during oral sex or may wish for partners to adjust their sexual technique to one more closely resembling oral sex performed on a penis (with or without the use of a prosthetic penis). As with cis people, sexual permutations are both myriad and meaningful; sexual expression and practices may run the gamut from vanilla to kink; and partnerships themselves may be sexual, asexual, monogamous, or polyamorous. Trans people may use static or fluid language to describe their sexual embodiments and may also engage in static or flexible sexual practices. These innovative strategies for recoding bodies, language, and sexual practices are often integral to sexual practices between trans people and their partners.

Online Connections: Social Media, Dating Sites, and Pornography

In biographies, autobiographies, and research narratives of trans experience, a frequent trope is isolation and not having connections or models for what trans embodiments or sexualities might be or become. The advent and widespread availability of the Internet via smartphones, tablets, televisions, and computers, along with the growth of Internet social media, dating sites, and pornography, have expanded *trans imaginaries*. Imaginaries offer considerations and conceptualizations of what might lie within a realm of possibility for an individual, a group of people, or an entire society. In this way, online social media, dating sites, and pornography each contribute in their own way to shaping imaginaries around embodiments and sexualities for trans people today.

Social media sites such as Facebook (and, previously, MySpace and LiveJournal), Twitter, YouTube, Instagram, and TikTok allow individuals to find and connect with one another in public and private groups and to document and share images and descriptions of their bodies, lives, and relationships in great and sometimes intimate detail both publicly (e.g., Tweets, posts, photos, recorded video, live video, and comments) and privately (e.g., using restricted access settings or through DMs—direct or private messages, photos, and videos) with people across the world. Social media have provided a medium to connect and create both public and private online groups and forums to share experiences and form interest groups. Using public and private groups, targeted searches, and hashtags, trans people now find one another (as well as potential sexual and romantic partners) to document and offer suggestions and support around embodied changes such as clothing and hair choices, hormone replacement therapies, and gender affirmation surgeries. Social media facilitate fundraising efforts (e.g., GoFundMe) and efforts to create online awareness and action (e.g., Change.org in the form of petitions) around issues connected to trans rights.

Online dating sites like Match.com, Tinder, FetLife, Bumble, HER, and Grindr allow people to find one another for intimate connections ranging from one-time sexual hookups and play to potential marital partners. Trans-specific online dating sites provide additional options—meaning that a broader cross section of trans people have access to representations of a more diverse reflection of trans embodiments and sexualities than ever before. This new social landscape also creates possibilities for exploitation and danger because individuals must invest trust in the stated intentions

and motivations of strangers as they initiate these online-mediated connections. The creation and expansion of online social media and dating sites are just one example of the slippage between the local and global and public and private in everyday social and sexual lives today. While these online platforms are often discussed as pivotal to development of trans identity and community, another controversial online platform may also hold critical although less discussed importance—trans pornography.

Pornography, or explicit written, audio, and/or visual depictions of sexual activity for the purposes of reader or viewer sexual arousal, via print and digital sources, is both ubiquitous and taboo in sexually obsessed and repressed cultures such as that found in the United States. Pornography is a controversial yet stunningly popular enterprise, specifically in the Internet era, with many adults accessing Internet pornography on a regular basis. Given abstinence-only sexual education in many regions of the country, many young people's first connection to sex and sexuality is through accessing pornography. Pornography has long been controversial, with concerns that range from those grounded in religion to those grounded in feminism. While some object to pornography on moral grounds, others criticize sexual commodification, objectification, and exploitation of those involved in its production. Despite these objections, there are many proponents of pornography. Some pro-sex feminists argue that feminist pornography offers a frame shift for pornography, ushering in a wave of pornography directors, producers, actors, and distributors that subvert existing norms in the industry and pave the way for greater inclusion and leadership among women and trans people.

Pornography that includes trans representation is not new. Indeed, it has been a thriving subgenre of pornography commonly referred to by the pejorative term *tranny porn*. The most frequent consumers of this subgenre of pornography consist of heterosexually identified cis men, which may lead to its frequent classification as fetish porn. However, inclusion of trans actors and various forms of trans embodiment have broadened. Trans porn magazines (zines) created by and for trans people and their partners—such as *Original Plumbing* and *Fucking Trans Women,* both of which were circulated in print and digital formats—offered venues through which trans bodies and sexualities could be seen and celebrated on their own terms. Trans people may also engage in camming, which involves using webcams to connect with customers who pay to chat with performers and/or watch (and sometimes direct) them as they engage in sexual talk or performances solo or with others. Camming generally offers a more interactive sexual experience for customers than traditional forms of pornography.

Queer feminist pornography directors and producers have taken control to form their own distribution companies and websites (such as Shine Louise Houston's Pink and White Productions and PinkLabel.tv; Courtney Trouble's Indie Porn Revolution, formerly NoFauxxx.Com; and Courtney Trouble and Tina Horn's QueerPorn.tv). In addition to paid pornography sites, which provide regular employment for some trans sex workers, free and amateur Internet pornography continues to expand. Pornhub (Pornhub.com) is currently the largest and most frequently visited source of online pornography featuring both professional and amateur performers and paid and free content. Amateur users here, and on other sites, may post videos that are then streamed to others across the world. This expansion of online pornography markets has meant greater and more inclusive representation of trans actors in contemporary pornography on both for-pay and free/amateur websites. The types of sexualities and sexual interactions depicted are wide-ranging, queering cisnormative and heteronormative notions of gender and sexuality. The expansion of trans pornography has also resulted in the emergence of some rather high-profile (and sometimes controversial) trans porn stars (e.g., Buck Angel, Ts Madison [Maddie], Jiz Lee, Kimber James, Venus Lux, Syd Blakovich, Allanah Starr, and Bailey Jay). This visibility of diverse queer and trans embodiments and sexualities, particularly when these representations are under the direct control of queer and trans people themselves, is producing new possibilities and realities for trans people and their partners today.

Sexual Health and Well-Being

Despite the general paucity of research focusing on trans sexual health and well-being, one area has received considerably more attention than others—sex work and the risk of contracting and

transmitting HIV. This research tends to focus largely on transmission among trans women of color who live in poverty and those who engage in survival sex work. Prior to the advent and uptick in use of preexposure prophylaxis (PrEP), this was one of the few areas of research focusing on trans populations that regularly received federal research funding. Because of systemic racism and barriers that low-income trans women of color experience with regard to racial profiling, violent transphobia, and accessing social support, affordable and trans-affirmative health care, and educational and employment opportunities, members of this group tend to be overrepresented among intravenous drug users, prison inmates, and survival sex workers.

Some groups of trans people engaging in sex work may face increased threats to their sexual health based on uneven access to PrEP and the fact that riskier sexual behaviors often yield greater income. For example, not using condoms, or *barebacking,* despite the additional HIV transmission risk that it carries, often draws a monetary premium in terms of the exchange of sexual services for pay. Sex workers also report coercion to engage in sexual intercourse without condoms in their personal and/or working lives. Paradoxically, broader availability and use of PrEP may increase pressure to engage in less-protected sex due to decreasing fears about contracting and transmitting HIV, leading to associated increases in other sexually transmitted infections (STIs) such as gonorrhea, syphilis, herpes, human papillomavirus (HPV), and chlamydia.

Consumers of sexual services from trans sex workers tend to be disproportionately cis men who predominantly wish to engage as the penetrative sexual partner. Trans sex workers report primary provision of sexual services as receptive partners, placing them at disproportionate risk for contracting HIV from infected clients, especially those who engage in receptive anal sex with clients without condoms. Despite assumptions that sex work would be the primary pathway for contracting and transmitting HIV, research suggests that trans sex workers are most commonly infected through sexual contact with partners outside of work. The majority of primary and casual partners among trans women engaged in sex work are cis-heterosexually identified men who have sex with men (MSM) and trans women. Relatively little research has been conducted on the clients and primary partners of trans men and nonbinary people involved in sex work. Existing research on the risk of contracting and transmitting HIV among trans sex workers has tended to view this population as a monolith and may depict them primarily as public health risk vectors. Rarely has this research called for the dismantling of systemic racism and associated structural and institutional barriers to accessing educational and employment opportunities among those whose lives exist at the intersection of systems of racism, classism, heterosexism, and cisnormativity.

Future Research Directions

Trans people, identities, and bodies remain simultaneously exoticized and marginalized. Within this social context, there are concerns about exploitation of trans people and their partners. One strategy for addressing these concerns is to ensure that trans people and their partners have opportunities to produce and disseminate knowledge about their own lives, identities, and experiences. Providing education and training around sexualities that is accurate, comprehensive, ethically produced, and nonstigmatizing is another strategy.

Existing sexualities research tends to focus on populations that are white, middle class, and highly educated. Trans sexualities research sometimes serves as an exception to this general limitation given the previously discussed focus on HIV risk among trans sex workers, many of whom are poor or working-class trans women of color. Future research could expand to include topics such as sexual pleasure, power, consent, and negotiation. Research on trans sexualities tends to privilege in-depth interview studies. Future research might broaden this to include surveys, literary and other content analysis, and ethnographic approaches to studying trans people and their sexualities.

Future research could examine the experiences, intimacies, and desires of older trans adults and how their sexualities and sexual identities shift across the life course. Social scientific research on sexualities tends to assume monogamous or couple-based relationships and to skirt discussion of sexual behaviors. Future research could expand to include poly and other nonmonogamous relationship forms and actual sexual practices. Focus on a broader, nonclinical cross section of the trans population may allow future researchers to deepen knowledge

about the diverse sexual behaviors and practices in which trans people and their partners engage.

Nonbinary people's experiences are complex and intertwined within broader societal patterns of race, class, sex, gender, and sexual inequalities. As such, studies of nonbinary people's experiences with dating, relationships, and sexuality may offer fertile ground for further social scientific research. Researchers may seek to ask nonbinary people specifically how they negotiate their sexualities, bodies, and intimate relationships. Examination of nonbinary and trans women's experiences may be compared with findings from studies focused on trans masculinities, cis partners of trans people, and trans children and youth.

Sissy Boy Experience

Sissy boy experience is about not being a "real" boy or man and the social trouble that this causes. The scholarly work about sissy boys and their experience tends, on the whole, to consider the term to denote young people whose assigned sex at birth is male and who do not conform to the expected performance of gender that is understood to be properly masculine. This entry considers the way in which sissy boy experience has been considered in some literature and outlines a way in which the experience of naming boys as sissy might afford a disruptive resource for reworking systems of sex and gender.

Sissy Boys

Sissy boys are gender nonconforming: They do not think, feel, or act the way that "boys" are supposed to. Sissy boy experience then would describe the experience of "boys" who do not conform to the

normative standards of masculinity. Sissy boys are sensitive and they act in ways that are soft, weak, quiet, or too "feminine"; they like to do things that girls are supposed to do—play with dolls, sing, dance, make believe, read, and be creative. Much of the published work about sissy boys is *by* sissy boys, recounting their experience of being out of place, singled out as different, and being troubled by this. Many of these discussions involve accounts of the way in which the experience of sissy boys *troubled* other people, causing concern for their parents or caregivers, teachers, and peers—that is, other children whose response to the sissy boy's gender nonconformity led to verbal and physical abuse, ostracism, and marginalization for the sissy boy. Accounts of growing up sissy have been very important in providing insight into the experience of abuse, vilification, and ostracism and the ways in which people have been affected by this type of experience. People have shaped their lives in these contexts, working against the powerful impact of such experiences.

Source of the Sissy Boy

The source of the sissy boy as a psychological and social problem has sometimes been attributed to a too-attentive mother, an overly strong attachment to a mother, or an absent father. In some discussions, the sissy boy is an aberrant form of human identity that might have a spiritual or genetic source. A good deal of scholarly work, particularly in childrearing literature and psychological and psychiatric literature, has been oriented to "fixing" sissy boys, seeing their gender nonconformity as a problem that needed to be solved through forced coaching into the ways of masculinity, psychological and therapeutic treatment, or religious intervention. Interestingly, a good deal of the literature sees the sissy boy's experience as a precursor to adult homosexuality, thinking of the sissy boy as proto-gay, with sissy boy–ness as an indicator of an emerging sexuality. Those writing in the psychological/psychiatric literature and those writing from a personal standpoint with the aim of reducing discrimination and the negative and abusive experience of sissy boys tend to take this view—that sissy boy experience is a foreshadowing of adult homosexuality. The poststructuralist perspective taken by some researchers has critiqued much of what has been written about sissy boy experience, on the grounds that it is informed by thinking about, and being in, the world and human relationships in ways that support heterosexual and patriarchal structures that align maleness, masculinity, and heterosexuality.

Violence

Social practices of linguistic and other kinds of violence are used to publicly "name and shame" young males who are insufficiently masculine/problematically too feminine. The term *sissy boy* differentiates a type, signaling deviation and variation, as well as simultaneously signaling that some terms (and ways of being) are more authentic, clear-cut, and unproblematic than others. The term also signals the grounds for differentiation: Being too feminine for a "boy" is troubling and shameful.

The word *sissy,* yelled across the playground or more quietly spoken close to a young person's ear by peers, parents, or teachers, is a kind of linguistic violence enacted against boys by those who are discomforted by gender nonconformity and signals an anxiety inherent in the maintenance of socially produced identities, particularly the fragile and anxious figuring of masculinity as *the* taken-for-granted, key term in our social semiotics of identity.

When language is used violently to call out sissy boys who do not conform to gender norms, our social order is offered a critical resource, an opportunity to consider how and to what effect the iterative, performative production of identity might do otherwise than sustain systems of sex/gender/sexuality. Naming an identity—boy, girl, gay, straight, male, female—is always violent because naming constrains the proliferating and dynamic performance of self into the regulating system of social semiosis making our "selves," our sexes, our genders, and our sexualities appear "real." Left uncritiqued, this reality-iterating operation of the naming identities prevents us seeing the terms through which identity is understood. Without observing this, we miss how these terms are merely a part of a theory of sexed and gendered identity, not a reality, and, as such, are always in the service of power/knowledge formations.

Social Class

Social class is an important component of trans people's identities and lives. Social class can illuminate not only the economic resources needed (or lacking) to navigate systems like health care, education, and obtaining accurate identity documents but also the agency and comfort that some have (or do not) when engaging these systems to help trans people navigate life.

This entry discusses the concept of social class and what is known about trans people in the United States along various aspects of social class, including economic factors like income, educational attainment, home ownership, and employment. It also addresses changes in social class that may accompany gender transition. Additionally, it discusses the work that needs to be done to better understand cultural aspects of social class for transgender people.

What Is "Social Class"?

Social class is a broad term, generally referring to the social and economic status of an individual or a group of people, such as the "working class," "middle class," or "upper class," although other terms exist. This status or class can be actual (as in the actual experiences of a person or group) or perceived (as in the assumptions or stereotypes about that person or group). Whereas people tend to think of social class mainly in terms of a person's income, social class is actually made of many factors. It can include economic factors such as income or wealth, but it can also include or be measured by other, related factors such as educational attainment, job type or stability, and economic mobility. For example, take two individuals who, on paper, make roughly the same income, but one is paid an hourly wage and one is paid an annual salary. If an unexpected event occurs—such as an accident that temporarily prevents them from working, or a shift being canceled, or a holiday called—the hourly worker is much more likely to lose their income than the salaried worker. That is one of many potential distinguishing factors between those of one social class and those of another, or at least those with more economic stability than others.

Social class can also include a broader cultural background or "lifestyle" markers, such as a person's clothing, hobbies, mannerisms and language, food options, media preferences, and much more. For example, in terms of hobbies or sports, NASCAR racing and water polo may have very different connotations for many people with respect to the assumed social class or background of those who are interested or participate in them.

Because class also reflects a broader cultural background and experiences, this means that while a person's income or economic status may change over time, their cultural background does not necessarily change. A person who grew up as working class but now has what may be considered a middle-class income or job security nonetheless still comes from that working-class background, and they likely still have working-class family members that they need to support. Their experiences of growing up working class may still greatly inform the way others perceive them or how they think about their own social class, irrespective of their present-day income, property, education, or other factors.

Experiences of social class—as well as the perceptions and valuations that undergird social

class—can vary substantially by race and ethnicity, gender, where one lives, and more. Experiences of discrimination in hiring or salary can make economic mobility and stability more difficult for people of color, women, or trans people to obtain. For example, a 2019 study by researchers at the U.S. Census Bureau showed that Black Americans have substantially lower rates of upward mobility and higher rates of downward mobility than whites, leading to large income disparities that persist across generations. In other words, Black Americans are less likely than whites to move up the economic ladder during their lifetime and instead more likely to move down—meaning that they are more likely than whites to be worse off as adults than they were as youth. Additionally, what it means to be middle or upper class in rural communities may be quite different than in urban areas. And societal perceptions of class can also be affected by race or gender: American society generally has very different responses to Black women versus white women who work as parents rather than taking paid work outside the home.

Social Class and Trans People

Trans people grow up in communities around the country and come from any and all social classes. Trans people are also diverse in their race and ethnicity, religion, and other characteristics that all further diversify trans people's experiences of social class. That said, some aspects of contemporary trans experiences may shape social class in important ways.

Shifts in Social Class

Although research generally suggests that for many people in the United States, social class is often shared between parent and child, research also suggests that for LGBTQIA+ people, and perhaps trans people even more so, the ruptures in family that can result from living openly as LGBTQIA+ may affect their economic stability or social class over time. For example, in the 2015 U.S. Transgender Survey (USTS)—the largest survey of trans people in the United States, with nearly 28,000 respondents—nearly half of trans people who were out to their immediate families reported they had experienced at least one form of family rejection. Trans people who had such experiences were far more likely to report experiences of unemployment, homelessness, and doing sex work, as compared to trans people who were out to their immediate families but did not experience familial rejection.

Research also finds that many trans people have experiences of discrimination that threaten overall economic, emotional, and social well-being and can contribute to shifts in actual and perceived social class. For example, a person who built a career as a well-respected university professor and then comes out as trans and lives her life as the gender she has always known herself to be may find herself without a job and struggling to meet her most basic needs. The 2015 U.S. Transgender Survey shows that trans people routinely experience such discrimination. For example, 27% of respondents who said they had or applied for a job in the past year reported being fired, denied a promotion, or not hired at all due to their gender identity or expression. These experiences of discrimination, especially as they accumulate over a person's lifetime, can significantly undermine a person's economic stability and shape their overall experience of social class.

Additionally, as a person navigates life as a trans person, they often have to simultaneously navigate how their gender intersects with their social class, along with other key characteristics such as race, sexuality, and geography. For example, the societal expectations, privileges, and benefits given to an upper-middle-class white woman in the United States differ greatly from those of a working-class Latina woman. When a trans person begins to transition or otherwise live as the gender they know themselves to be, they may experience surprise or difficulty in navigating new sets of expectations and perceptions based not only on their gender identity but also on class-related assumptions and intersections with their gender.

Economic Measures

Overall, the economic picture for trans people is often described as one of vulnerability and resiliency in the face of increased risk of poverty and economic instability, often resulting from experiences of family rejection and discrimination. Research consistently finds that trans people are more likely to report living in poverty. According

to a 2019 analysis of federal data from the Centers for Disease Control and Prevention (CDC), an estimated 30% of transgender people live in poverty, compared with 16% of non-transgender, heterosexual people in the United States. This disparity is even bigger for trans people of color, those with disabilities, and trans women.

This is the case despite the fact that trans people who are age 25 and older have higher rates of educational attainment compared with the general U.S. population: According to the 2015 USTS, 53% of trans people reported having a bachelor's degree or higher, compared to 31% of the U.S. population.

Notably, a very small percentage of trans people reported owning their own homes compared to the national population; just 16% of people who participated in the USTS said they lived in a house, apartment, or condominium that they owned, compared with 63% of the overall U.S. population. At the same time, trans people are far more likely than the general population to report having experienced an episode of homelessness—sometimes as a result of family rejection or because of housing discrimination or other economic insecurity that left them unable to find stable, secure housing.

Cultural Measures

Given the extent to which trans people are more likely to experience poverty, unemployment, and discrimination, it is likely that many trans people also disproportionately share cultural markers or experiences often associated with lower-income or working-class communities. However, while social class comprises more than only economic factors, comparatively little research currently exists on these more cultural elements of social class for transgender people.

In one study of trans people that included discussion of social class, titled "Intersectional Identities and Conceptions of the Self: The Experience of Transgender People," researcher Kylan Mattias de Vries explored the intersections of race, class, gender, and sexuality. The white trans people interviewed described social class and sexuality being more a core part of their gender than their race, in the ways that social class may, for example, dictate family relationships, relationships, or comfort with violence as a means to solve problems. Trans people of color, on the other hand, described how social stereotypes about the intersection of race and social class influenced their gender presentation. For example, one participant who identified as Latino was often perceived as being working class by virtue of his being Latino. As a result, he often dressed in suits and ties to counter this perception, particularly in his work.

Another study, by Miriam Abelson, focusing only on transgender men in rural areas, showed that trans men in rural communities were able to find acceptance if they adhered to "appropriate rural working-class heterosexual masculinities." This illustrates how class (in intersection with geography, sexuality, and gender) influences the experiences of trans men in this study and likely trans people more broadly. Further research is needed to better understand the complexities and experiences of the cultural aspects of social class for trans people.

In conclusion, social class is an important lens—alongside and in interaction with race and ethnicity, gender, geography, and more—for understanding the experiences of trans people. Given what is known about the economic lives of trans people, there is evidence that trans people likely have a range of experiences in terms of social class. Yet, what is critical is that discussions of social class and the privilege (or lack thereof) that it affords can ease, or make more challenging, the experience of being trans.

Social Media

The Internet, specifically the rise of social media platforms, is frequently seen as an indispensable tool for trans community building as well as identity exploration and knowledge sharing. Social media, broadly defined, encompass a variety of websites and applications that enable users to create and share content, whether in textual, visual, or auditory form. The continued marginalization of trans people in society and their sensationalized treatment by mainstream media are often cited as reasons for why many trans people go online to find community and information. Despite the opportunities afforded to marginalized groups by new technologies, it is, however, also widely documented that social media can simultaneously promote the discrimination against, harassment, and surveillance of trans communities. Because of ongoing political efforts to legalize anti-transgender discrimination at local, state, and federal levels, many trans activists are strategically using social media as a means of shaping public discourse and participating in the political process.

Community Building

The rise of various Internet technologies has given trans people—who often experience isolation, fear, and harassment in their everyday lives—the unprecedented ability to communicate and connect with other physically distant trans community members across the United States and the world. To understand the importance of community building for trans people via social media today, it is useful to consider the formation of earlier online communities engendered by the digital revolution. In the late 1980s, new digital communication platforms, such as bulletin board systems, enabled trans users to share information and communicate with one another securely and anonymously for the first time. While originally only available to technology- and coding-savvy users, by the mid-1990s, the Internet became more widely accessible. Trans users specifically used Usenet, a distributed discussion system, which only required an email address for access, to create a plethora of content and discussion threads pertaining to various topics. From the early to mid-2000s, other messaging boards and journaling services such as AOL's Instant Messenger and Livejournal also provided trans users with important community spaces. By 2007, trans users began to migrate to increasingly popular social media platforms such as Tumblr, Facebook, and Twitter. In particular, the growing use of hashtags, which is signaled by the pound sign and allows for the grouping, organizing, and indexing of content on social media platforms, allowed for unprecedented online trans community building and knowledge production. Tagging practices that use specific trans subcultural knowledge and terms—for example, #trans, #boi (usually masculine-of-center), #nonbinary, #afab (assigned female at birth), #genderqueer #enby (a person who identifies as nonbinary), #t4t (trans person interested in other trans people romantically/sexually), #qtpoc (queer and trans people of color), and #pretestosterone—make it easy for users to find one another and connect around a specific topic, shared interest, and/or identity.

Identity Exploration and Knowledge Sharing

For trans youth who may not know or have access to other trans people in their day-to-day offline lives, social media often provide a crucial educational source for identity exploration and identity formation. In particular, the video-sharing platform YouTube has become a rich depository and archive of trans user-generated content that addresses a wide variety of trans topics and issues. A significant number of videos specifically feature journeys of transitioning (e.g., chronicling experiences with health care providers, hormone administration and dosage, or gender-affirming surgeries). Due to the dearth of trans competent medical providers, these vlogs (video blogs) serve

as valuable educational tools and medical resources for many trans people. Many of these videos, however, are created by white, straight- and binary-identified trans men whose experiences do not necessarily speak to those of trans women, trans people of color, and those who identify as nonbinary and/or queer. Other topics commonly featured in trans YouTube videos include "coming out" to friends, family, and employers; fashion and dating advice; and sharing information about changing one's legal name and gender markers on identification documents. These YouTube clips and vlogs thus provide crucial information and guidance for trans audiences, and they may also increase the cisgender majority's understanding of and empathy for trans people and the challenges they face.

Tumblr especially, a formerly independent microblogging site, was long regarded as a quirky subcultural space because its queer- and trans-friendly features enabled more fluid, nonlinear, nonnormative, and ambiguous identity presentations. Tumblr has been praised for enabling new modes of trans self-representation and self-definition that challenge and resist the commodification and tokenizing of transnormative imagery and figures by mainstream media. For example, in response to Caitlyn Jenner's much-publicized coming out on the cover of *Vanity Fair* in July 2015, many young trans people took to Tumblr to (re) create, curate, and share their own cover art. Under the hashtag #MyVanityFairCover, users asserted that not every trans person has the financial means to access or desires to embody the white, cisnormative beauty standards promoted by Jenner's transition or to be neatly re-boxed into the gender binary. Instead, these subversive do-it-yourself covers portrayed a wide range of diverse trans people of different genders, sexualities, ethnicities, classes, abilities, and nationalities.

Discrimination, Harassment, and Surveillance Online

Despite these positive developments around community building, identity exploration, and knowledge sharing, the anonymity and transience of online spaces also leave trans people vulnerable to online harassment, trolling, and bullying. Several studies extensively document trans users' hostile experiences online, which can involve anything from transphobic slurs and deliberate misgendering to deadnaming and death threats. Such harassment is often worse for trans women and trans people of color, which speaks to the intersections of racism, sexism, homophobia, and transphobia. Oftentimes, trans users find social media platform policies and protocols ill-equipped to address such harassment and to provide protections from abusive users.

Many platforms have also been critiqued for the surveillance and monitoring of trans users. Most prominently, Facebook's enactment of an "authentic names" policy in 2014 resulted in the suspension of the accounts of many trans, drag, and indigenous users whose online names did not necessarily match their legal names. Despite Facebook's expansion to more than 50 custom gender options, analyses of Facebook's underlying codes and algorithms illustrate that user identities are still stored as binary data points, presumably because binary user data can be sold more profitably to advertisers and marketers.

Similarly, in the wake of the 2018 enactment of FOSTA (Fight Online Sex Trafficking Act) and SESTA (Stop Enabling Sex Traffickers Act), Tumblr announced that the site would no longer allow "adult" content, including sexually explicit material and (with some exceptions) nudity. In addition to driving away and censoring artists and sex workers, this policy change specifically affects trans users because Tumblr's algorithms are notorious for flagging transition-related content as "adult." Tumblr's fear of being held legally liable, paired with its parent corporation Automattic's drive to monetize user data and content for advertisers, effectively marginalizes and harms trans Tumblr users. As a result, many no longer see the platform as a welcoming space for queer and trans expression.

Activism

Because intersecting oppressions often place trans people at the margins of various social justice movements, social media have provided a crucial platform for trans people to have their own voices heard and organize for political and sociocultural change. Twitter, in particular, has become a key site for trans hashtag activism and movement building.

For example, the hashtag #GirlsLikeUs coined in 2012 by trans writer, director, and activist Janet Mock has created a significant following. Conversations by trans women of color who challenge their erasures, misrepresentations in popular discourse, and the ongoing violence they face have proliferated. Driven by her own experiences with transphobic remarks while she was transitioning, trans actress Laverne Cox specifically coined the hashtag #TransIsBeautiful to assert that all kinds of trans embodiments, practices, and identities are, indeed, beautiful, not just the ones who "pass" as gender conforming.

In addition to the #BlackLivesMatter and #GirlsLikeUs hashtags, which have brought attention to police brutality and anti-Black violence, #TransLivesMatter has become a rallying cry to combat the disproportionate murder rates of trans women of color. When CeCe McDonald, a Black trans woman, was charged with murder for killing her attacker during a racist and transphobic assault in Minneapolis in 2011, activists effectively garnered nationwide attention for her case by rallying around the hashtag #FreeCeCe. Paired with on-the-ground protests and direct-pressure tactics, the #FreeCeCe campaign effectively exposed news media's racialized and transphobic framing of the case and the state-sanctioned violence enacted against McDonald. The convergence of both on- and offline activism in the campaign resulted in a raised public consciousness about the disposability of the lives of trans women of color.

Many of these hashtags specifically seek to highlight and emphasize intersectional trans experiences as a means to confront the persistent harmful centering of cisgender whiteness in much LGBTQ and feminist organizing. Some also specifically dissect how the seemingly all-inclusive term *women of color* still renders invisible women who are not cisgender or who fall outside the black–white binary. Globally, annual vigils for the Transgender Day of Remembrance (TDOR) on November 20, which have been held since 1999, are now also extensively documented online with #TDOR. Similarly, celebrations of the International Day of Transgender Visibility on March 31 are archived under #TDOV, which showcases the accomplishments and survival of trans people worldwide. With the ongoing attacks on trans people and the rollback of many legal protections for LGBTQIA+ individuals more broadly, it remains to be seen whether trans activism spurred by historically excluded and marginalized voices may be able to use social media platforms for generating truly intersectional movement building.

Social Media Influencers

With the rise of social media platforms since the mid-2000s, the social media influencer has become a central figure in digital media production. While various terms have been used to describe these figures, including content creator, guru (particularly within beauty communities), and microcelebrity, for the purposes of this entry, the term *influencer* will be used to encompass a diverse range of individuals who have achieved a level of mainstream celebrity based primarily on their social media output (as opposed to working in more traditional media industries, such as film and television). Platforms commonly used by influencers include but are not limited to Instagram, Tumblr, Twitter, and YouTube. This entry focuses on two subsets of social media influencers, each of which exemplifies a different aspect of social media production. Trans beauty influencers are generally more invested in educating the broader public about their experiences, showing that trans people are just like everyone else. Meanwhile, trans activist influencers take advantage of low-cost social media platforms to raise awareness about diversity and social justice issues.

Existing research on social media influencers, focusing primarily on cisgender individuals, has examined the differences between influencers and traditional celebrities. These differences include their usage of social media platforms as their primary source of visibility; their reliance on self-taught, do-it-yourself (DIY) media production; and their more direct engagement with their audiences. Additionally, they are typically compensated through alternative funding models, including corporate sponsorships, ad revenue, and direct donations from audiences through platforms such as Patreon.

While many of these features are also applicable to trans social media influencers, little research has focused specifically on trans influencers' unique circumstances. Emerging research in this area has identified, for example, the ways in which trans video bloggers (vloggers) use their platforms to educate their viewers about their experiences. The following sections focus on two major groups of trans social media influencers—beauty influencers and activist influencers—to discuss how trans influencers use social media and how they appeal to both cis and trans audiences.

Beauty Influencers

The beauty community, which is primarily active on YouTube and Instagram, remains one of the longest standing and most prominent communities of social media influencers. Beauty influencers have had a significant impact on the mainstream cosmetics and fashion industries, including collaborations with cosmetics brands and launching their own successful cosmetics companies. While many high-profile beauty influencers are cis women and queer men, trans women have also become top beauty influencers.

Prominent trans beauty influencers include Gigi Gorgeous, Nikita Dragun, and Julie Vu. These women all began their YouTube channels pretransition, presenting as male but engaging in gender-nonconforming behaviors, such as wearing makeup and feminine clothing, before announcing their intentions to transition relatively early in their respective YouTube careers. Subsequently, many of their videos have focused on documenting their gender transitions, including their experiences with hormone replacement therapy and gender-affirming surgeries. Thus, in addition to producing beauty-related content, such as makeup tutorials, their videos also serve an educational purpose, both informing cis viewers about trans experiences as well as educating trans viewers about what to expect during transition. Notably, many successful trans beauty influencers conform to cis norms of female beauty and have undergone numerous cosmetic procedures, including facial feminization surgery and breast augmentation. It is likely that their popularity can be attributed at least in part to how well they pass as cis women.

While many trans social media influencers are famous for being openly trans and publicly discussing their experiences, others choose to keep their trans identity private. Nikkie de Jager, who began her YouTube channel NikkieTutorials in 2008, did not disclose her trans identity until 2020. By the time she came out, she had already amassed 12 million subscribers, making hers one of the top beauty channels at the time. Thus, de Jager's popularity is not predicated on being trans, but rather on other factors, such as her skill with makeup.

Activist Influencers

Although political activism is certainly no new phenomenon, social media have allowed for new ways for individuals to self-produce and distribute their own activist media at relatively low cost. Unlike trans beauty influencers, who may discuss trans politics but typically do not prioritize political activism in their media productions, another subset of influencers centers politically activist messaging in their social media production. These influencers use imagery, text, video, and other media to challenge normative beliefs about trans identity and social justice.

Some activist influencers primarily produce image and text posts on platforms such as Instagram and Twitter. These influencers include figures such as Alok Vaid-Menon (formerly of the South Asian American artist-activist duo DarkMatter), Chella Man, Aaron Philip, and Vivek Shraya, all of whom are known for their Instagram selfies. Unlike trans beauty influencers, who often conform to gendered beauty norms, these influencers instead challenge these norms and use their selfies to showcase alternative ideas of gender presentation. In addition to producing selfies, these influencers also work as artists, writers, performers, and models, parlaying their social media visibility into other fields of cultural production. Furthermore, as genderqueer people, people of color, and people with disabilities, these influencers address the intersections of transness with race, class, and disability.

Other influencers with more politically oriented goals work primarily on YouTube, such as Natalie Wynn (also known by her channel name ContraPoints) and Kat Blaque. These influencers have gained attention for their long-form videos where they discuss political issues surrounding trans identity, race, gender, and sexuality. Wynn, for example, first became known for her videos arguing against alt-right ideologies before she began her transition; her videos have since shifted focus to address issues such as transphobia and gender dysphoria. Thus, these influencers appeal to more politically minded audiences who are already invested in social justice, rather than those who are simply learning about trans experiences.

Social Transition

Social transitioning refers to the changes a person makes in order to live socially in a way that matches their internal gender experience. Social transition is often, but not necessarily, the first step a trans person takes toward aligning their life experiences with their internal gender experience. This may take many forms, including but not limited to using a different name, using different pronouns, adjusting their physical appearance through the use of cosmetics and different clothing, using bathrooms that better match their gender, and legally changing their registered name and/or sex/gender on official documents. A person may decide to make one, some, or all of these changes during their social transition. Factors that may affect a person's decision to engage in social transitioning include but are not limited to concerns about physical safety, employment security, or lack of material resources. Age also may affect the timing of social transition. Social transition can take place at any point throughout the human life span and look very different

among prepubertal, adolescent, adult, and older adult populations. Notably, there is currently some controversy surrounding prepubertal children's social transitioning due to their young age. Practitioners and caretakers should familiarize themselves with different approaches to prepubertal social transitioning. Finally, because of the sociocultural nature of how gender is expressed and understood, social transitioning may vary among people of different cultures, socioeconomic classes, and disabilities. The present entry thus reviews social transition with particular attention to age and sociocultural considerations as factors that may affect the process.

The Social Transition Process

Social transitioning involves changes to the social aspect of one's gender expression. A trans individual may begin this process by formulating ideas about their transition goals. For some, this may mean adopting traditionally feminine or masculine pronouns, appearances, aesthetics, and social roles. For others, this may mean nonbinary and less traditional gender expressions. Some of these transition goals may be easier to realize than others. For instance, pronoun changes may require much less time in execution than growing out one's hair. Some of these transition goals may also come with significant financial burden, such as buying a new set of clothes, purchasing binders for chest binding, or purchasing penile prosthetics for packing penile contours. Some other transition goals may require learning new skills. For example, individuals may want to acquire specialized makeup skills in contouring to masculinize or feminize their faces through the use of cosmetics. They may also want to develop a new fashion and sense of aesthetic in order to present as feminine, masculine, gender neutral, or gender nonbinary. In addition, voice therapy may help individuals in attaining higher- or lower-pitched voices. For some individuals who have less traditional and more gender nonbinary transition goals, it may be difficult to find online or real-life resources because of the cultural dominance of the gender binary. Nevertheless, choosing one's social transitioning goals is generally a highly personal process and requires some time and deliberation for many people.

A significant part of the social transitioning process is risk assessment. Because social transitioning often, although not necessarily, increases one's visibility as a trans individual, assessment of physical safety is often warranted in environments that expose individuals to transphobic/queerphobic victimization. Individuals may wish to consult other trans individuals, trusted friends and family members, or community resources during the process of risk assessment. For example, checking local laws and regulations regarding pronoun use may help manage the risk of workplace victimization. As of 2019, using the wrong pronoun for an employee or denying them access to preferred bathroom facilities is punishable by law in New York State. Trans individuals who are planning or undergoing social transition may wish to seek out this type of information to ensure their safety during transition. Another strategy one may wish to use is to identify allies within their environment. Social transitions can be especially daunting in environments that are hostile or unsupportive of trans individuals. Having allies and advocates may help tremendously in the transitioning process. While many social transitioning goals may increase the visibility of one's trans identity, some goals are still attainable without necessarily disclosing one's trans identity. For example, in some communities, long and short hairstyles are becoming less stigmatizing for men and women, respectively. Thus, a trans person may wish to grow out their hair to better reflect their inner gender experience while still remaining in the closet about their trans identity in order to ensure safety. Finally, a trans person may implement different sets of transition goals in different contexts in response to different levels of risk. For example, while a trans man may cut his hair short, he may only use masculine pronouns with his family and close friends and use feminine pronouns at his more politically conservative workplace.

After setting their transition goals and assessing for their safety, a trans person may begin to implement their social transitioning plans. Because social transitioning often covers many different aspects of one's gender expression, it is often more of a gradual process than an instantaneous change. Furthermore, social transitioning is relatively reversible and flexible compared with other forms of transitioning, such as surgical and hormonal

transitions. A person may thus easily revise their transitioning goals multiple times throughout the process as they test out how each change feels. As they experiment with different ways of expressing their gender, individuals may find out more about their gender identities, which may in turn help with devising new transition goals. For example, a person who previously adopted traditionally feminine clothes may realize that they are not fully comfortable with this transitioning goal. After some contemplation, they may realize that their gender identity aligns more with a nonbinary conceptualization. In this way, social transitioning does not necessarily take a linear form. More often than not, it is a process of continuous experimentation, reevaluation, and implementation.

Developmental Stages

Social transitioning looks different for people at different developmental stages. Young children, adolescents, adults, and older adults have various levels of independence, interact with different social systems (e.g., schools, workplaces, and retirement homes), and have different gender roles to fulfill. Furthermore, generational shifts in the conceptualization of gender may also have an effect on the specific ways people choose to implement their social transition goals.

Prepubertal Children

Learning about different gender roles and their social connotations is a normative part of children's psychological and social development. For children who do not align with cisgender identities, this developmental task may be especially challenging. In addition to allowing children to explore their gender expressions and identities, family members and care providers may wish to provide additional support to help children navigate a wider repertoire of gender expressions. Age-appropriate materials may be presented to children to introduce them to the complexities of gender in an approachable manner. Care should be taken to avoid assumptions about children's gender identities, as adults may inadvertently presume a fixed trajectory for children's gender development, which may hinder children's free exploration of their gender experience and desired ways of gender expression. Affirmative caretakers and care providers should respect children's agency in experimenting with different gender expressions and hold a neutral position while avoiding making assumptions about young children's gender outcomes. For example, instead of saying, "We will support our child in taking estrogen when she reaches adolescence," family members may instead say, "We will love and support our child whether she continues to identify as a girl, returns to feeling like a boy, or adopts a nonbinary identity in the future."

Notably, there are some controversies surrounding prepubertal social transitioning. There are three main approaches to treating gender-nonconforming children: supporting social transitioning, discouraging transitioning, and the wait-and-see approach. Part of this controversy stems from findings that suggest not all trans-identifying prepubertal children may continue to identify as trans after puberty onset. As of 2020, no consensus has been formed among researchers or clinicians. However, it is clear that no one approach is appropriate for all children, and care providers are highly encouraged to familiarize themselves with these different approaches. Within a gender-affirmative framework, supporting children's gender explorations and social transitioning is believed to be supportive of children's identity formation process, minimize shame, and affirm their identity at the present moment. The overarching message a gender-affirmative clinician conveys is that children's exploration of their gender identity is normative, and whether they eventually identify as cisgender or trans in later life has no bearing on their intrinsic value.

Adolescents

As children advance into their teenage years, one of their main developmental tasks is to gain more independence as individuals. During this stage of life, teenagers often spend increasing amounts of time with their peers and friends and decreasing amounts of time with their parents. Nevertheless, while they may take their social lives more seriously than before, parents and family members continue to be a major source of support, both psychologically and financially. Family members and care providers should take care to respect

the increase in agency and autonomy among teenagers and help them develop their own social transitioning goals.

Social transitioning can take place in many forms during this period. First, puberty suppressants can prevent the development of secondary sex characteristics, thus lessening the severity of gender dysphoria. Because the decision to suppress puberty or not may have a significant impact on one's physical appearance, adolescents may adopt different clothing, makeup, and other cosmetic strategies to better express their gender identities. Second, puberty is a period of gender role intensification. Schools, friend groups, and other social environments often emphasize gender differences much more than during prepubertal childhood. Thus, social transition during this period may involve the teenager navigating a world where cisgender and binary identities are the norm. Because of teenagers' growing intellectual capacity, family members and care providers may wish to discuss the social reality of gender roles with the teenager. Finally, sexual initiation commonly happens during adolescence. Because sexual behavior is an important form of social communication, teenagers may adopt different strategies in negotiating their sexuality in a way that feels most aligned with their gender identity. For example, while penetrative and receptive sexual behaviors are associated respectively with masculinity and femininity in many cultures, trans adolescents with diverse genital physiologies may choose to engage in a wide range of sexual practices that may defy these gendered associations. Unfortunately, while sexual education varies greatly in quality depending on local regulations, most do not cover sexual practices among LGBTQIA+ individuals. Trans teenagers may not have access to accurate and affirmative sex education, and they are often tasked with exploring their sexualities alone. Thus, care providers and family members may wish to discuss sexual practices with trans adolescents while paying special attention to discussions surrounding the intersection between gender roles and sexual behaviors.

Adults

Adults have much more independence and autonomy compared with underage children. They are often, although not necessarily, financially independent and generally able to choose their own communities and friend groups. They are also able to undergo medical transitioning, including hormone and surgical procedures, if they so desire. However, because adulthood is the longest period of a person's life, social transitioning can look very different depending on the person. Care providers should pay close attention to each individual's specific circumstance and transition goals and work collaboratively with the person to best assist in their social transitioning.

One common worry among adults who are first coming to terms with their trans identity is that they may be "too old" to socially transition. Research consistently shows that social transitioning is a protective factor among adults against poorer mental health outcomes, such as depression, anxiety, suicidality, and substance use. Major trans health care organizations, such as the World Professional Association for Transgender Health (WPATH), officially recommend social transitioning as an important factor in promoting trans well-being. While taking safety issues into consideration, care providers should encourage social transitioning among adults.

Another common worry among socially transitioning adults is the potential impact on their existing relationships. While social transitioning affects interpersonal relationships at all age levels, adults may experience additional anxiety because of increased entanglement of these relationships with their lives. For example, an individual who wishes to begin living as a woman may worry about her wife and children's reactions. Care providers who work with trans adults are advised to take a collaborative and affirmative approach, empathizing with and validating these very real concerns about the social impact their transitions may bring. Some strategies may include rehearsing challenging conversations beforehand, providing psychoeducation on trans issues and the importance of social transitioning, and enlisting help from community resources and/or other trans individuals who have gone through similar processes. When reconciliation between social transitioning and preexisting interpersonal relationships is impossible, techniques such as radical acceptance, reassessing core values, and exploring gender authenticity may promote a sense of dignity, agency, and authenticity in the trans individual.

Older Adults

While research on older LGBTQ+ individuals has increased significantly in recent years, there is still a lack of understanding of the experiences of older adults who are first embarking on social transitioning. Nevertheless, studies show that some common worries shared by older trans individuals include fear of accessing health services, internalized stigma, victimization, and lack of social support. A major concern of older trans individuals is that disclosure of their trans identity will expose them to discrimination and thus limit their choices in access to care. While older trans individuals may have less control over their living situations, care providers should take care to promote a sense of agency, independence, and dignity.

As with adults, a common worry among older trans adults who are first coming to terms with their gender identities is that they may be "too old" to socially transition. They may also have less experience exploring what their gender identity means due to the more conservative political climate during their younger years. Thus, care providers may want to work on psychoeducation about what gender is, how to explore one's gender, and how to navigate diverse gender spectra while promoting a sense of control and confidence. Because access to care from families and/or old-age care facilities is a major concern for older trans folks, care providers may wish to help identify ways to ensure healthy and secured living after social transitioning. This may mean giving LGBTQIA+ competency training to family members or care facilities, identifying existing LGBTQIA+ competent care facilities, or developing social transition strategies that help inspire a sense of authenticity about one's gender while addressing realistic concerns about victimization.

Sociocultural Considerations

Different communities have different ways of understanding, expressing, and embodying gender. Many factors can impact the way one may wish to socially transition. Culture, class, and disability are just some of the factors that one must take into consideration when it comes to social transitioning.

Culture

A Muslim woman may wish to wear specific forms of headwear to honor her beliefs; a Chinese man may take on different ceremonial roles during family members' weddings and funerals; a Japanese nonbinary person man may wish to adopt a gender-neutral form of self-address in the Japanese language. Each of these gender practices challenges the way European cultures have traditionally performed binary gender. Furthermore, many cultures around the world have existing conceptualizations of trans identities, such as the Samoan *fa'afafine,* the South Asian *kinnar/hijra,* or the Mexican Zapotec *muxe*. When trans individuals of diverse cultural backgrounds who live in predominantly European societies begin their social transition, they are often tasked with navigating multiple identities, negotiating their gendered presence with multiple groups of people, and all the while striving to find communities and establish positive social ties for their own well-being. Addressing these multifaceted concerns requires the trans individual and their care provider to engage in difficult but necessary conversations about race, culture, and gender. If care providers do not share the same cultural identity with the trans individual, initiative should be taken to educate oneself on relevant gender conceptualizations and work collaboratively with the trans individual.

Class and Socioeconomic Status (SES)

As one of the most powerful predictors of multiple health outcomes, class and socioeconomic status (SES) are important factors to consider in the social transitioning process. A homeless trans individual who is first embarking on social transitioning will have a very different process compared to their middle-class counterpart. Some common obstacles faced by impoverished trans individuals include but are not limited to the expense associated with social transitioning (e.g., purchasing new clothes and cosmetic items), increased concerns about workplace victimization and income security, and medical insurance coverage. The social reality of poverty can significantly affect one's transition timeline. Thus, care providers should work from a collaborative and

advocacy perspective. Helping trans individuals identify affordable transitioning items (e.g., connecting with local trans exchange communities where people exchange their pretransition clothing with each other), community resources (e.g., LGBTQ+ centers, churches, or charities), and health care providers that take their insurance or work pro bono may be key strategies when assisting a poor trans person's social transition.

Disability

Trans individuals and individuals with disability share many obstacles in common. Many face pathologization, discrimination, asexualization, hypersexualization, institutionalization, and dehumanization. Individuals who identify as both trans and disabled may experience exacerbated and complex forms of these challenges. For example, many care providers speak only to family members, rather than addressing the trans and disabled individuals directly. Furthermore, many people disregard the sexuality of trans and disabled individuals, and when they do not, the sexual relationship tends to be characterized by fetishization. Finally, the diverse body realities that trans and disabled individuals inhabit may require flexibility and creativity in social transitioning tactics. For instance, whereas electrolysis body hair removal may be too painful or otherwise unviable for some individuals, cosmetic techniques may aid in concealing hair growth. Another example is when neither mastectomy nor binders are viable choices for an individual. Wearing multiple layers of clothing, sports compression wear, or loose clothing for a more gender-neutral aesthetic may be considered alternatives. In general, the intersection of these different experiences can sometimes feel isolating. It is important for a trans and disabled individual to find sources of community support from others who share their identities. Online communities, Pride events, and local LGBTQ+ centers may be good sources where these social connections may be made. Care providers should also consider taking on advocacy approaches in order to help make sure that trans and disabled individuals are receiving the proper quality of care from their medical providers.

Conclusion

Social transition is an important part of a trans individual's transition process. Because it is often more reversible than other forms of transitions, individuals may use social transitions as a way to continuously explore, embody, and perform their genders. Social transitions can look very different across different ages, cultures, socioeconomic classes, and disabilities. Family members, caretakers, and service providers should take these considerations into account when providing support for trans individuals as they go through social transitions.

Sororities and Fraternities

Social fraternities and sororities, which were originally established exclusively for "men" and "women," are private clubs that have the constitutional right to discriminate on the basis of sex. Trans members have historically struggled to navigate membership in fraternal organizations. In recent years, a growing number of fraternal organizations have revised their membership requirements to expressly allow trans individuals to become and remain members.

Before the Conversation

Before 2008, few fraternal organizations had policies addressing the membership eligibility of trans individuals. Even fewer had the tools to approach the topic. As a result, chapters and members had to navigate the issue on their own.

Some members who transitioned continued to be accepted by their chapters, while others limited their involvement after graduation, fearing a revocation of their membership. Some individuals remained actively involved from a distance under their dead (legal) names. Others notified their chapter of their transition, resulting in the loss of their membership. These less-than-ideal "solutions" became a catalyst for the necessary discussions about trans membership within the fraternal community.

LGBTQ+ Fraternal Organizations

Because of the uncertain climate for trans individuals (and LGBTQ+ individuals generally) within fraternal organizations in the late 1900s and early 2000s, many LGBTQ+ students sought the benefits of the fraternal experience by forming their own groups, including the following:

Alpha Lambda Tau, founded in 1999 for gay, straight, bisexual, and trans men.

Delta Lambda Phi, founded in 1986 for gay, bisexual, and progressive men; trans men were expressly included in November 2011.

Gamma Rho Lambda, founded in 2003 for gay, straight, bisexual, and trans women; membership was later opened to trans and gender-nonconforming individuals.

Omicron Epsilon Pi, founded in 2000 for lesbian women, with an emphasis on women of color.

Phi Tau Mu, founded in 2004 for transmasculine-identified students.

Sigma Phi Beta, founded in 2003 for gay, straight, bisexual, and trans men in college; the organization clarified in 2006 that a change in gender identity or expression would not affect an individual's membership.

Even with the growth of LGBTQ+-centered organizations, however, trans students still sought membership in other fraternal organizations. For these individuals, 2008 was a watershed year in moving the fraternal community forward on the topic of trans membership because of Sarah Fielding and Jessica Pettitt, who authored *Beginning the Conversation*, a fraternity and sorority trans resource guide.

Starting the Conversation

In the 2010s, trans membership gained additional attention because of increased dialogue between chapters and inter/national organizations. Specifically, questions arose as to whether sororities and fraternities were prevented from admitting trans members under Title IX of the Education Amendments of 1972. Research confirmed that Title IX does not place any requirements on the sex of their members.

Instead, as private clubs, social fraternal organizations have the right to determine their own membership criteria. As established by the U.S. Supreme Court in a series of decisions, this ability derives from the right to peaceably assemble under the First Amendment of the U.S. Constitution. Congress did not disturb this constitutional foundation when enacting Title IX. Title IX prohibits educational institutions that receive federal funding from discriminating on the basis of sex in their educational programs and activities. Thus, an institution cannot have sex-based inequalities in admissions and financial aid, as well as unequal access to curricula, student groups, and athletics. However, they are permitted

to recognize fraternities and sororities, if they choose, without violating Title IX.

Clarifying Eligibility

Understanding that Title IX does not restrict their membership or affect their ability to be recognized by colleges and universities, some national fraternal organizations developed and announced policies on trans membership. Others privately enacted such policies. Some organizations determined that a member who transitions is still a member because they have not violated any existing policies or constitutional provisions. Most organizations have not yet taken action on trans membership.

In the late 2000s and 2010s, more than 35 national fraternal organizations addressed trans membership in some way. Most defined eligibility to include all students who "identify" or "consistently live and identify" as a "man" or "woman." Some policies require providing legal documentation to be eligible for membership. All policies address eligibility requirements for potential new members, but many remain silent as to whether members who transition will retain their membership.

Eligibility of Nonbinary Individuals

Fraternal organizations are premised on a gender binary, in that they expressly exist as "men's" or "women's" organizations. Even the groups that have enacted a trans membership policy still require students to identify as either a "man" or "woman." Nonbinary individuals, therefore, would not be eligible to join even groups that expressly allow trans members.

One organization, Delta Phi Epsilon, has defined eligibility to include cis and trans women, as well nonbinary and gender-nonconforming individuals "who are committed to the advancement of womanhood." Their policy recognizes how including binary and nonbinary trans individuals is consistent with the organization's founding principles.

Moving Forward

Membership in a fraternal organization can provide vital affirmation and empowerment and serve as an important source of validation for trans students and their gender identities as they navigate a cisnormative world. Hundreds of chapters across the United States have created a space for trans individuals, and this number is expected to grow, as more students come out as trans and seek a place within the fraternal community.

South Asian Trans People

While use of the term *trans* in South Asia can be traced back no more than two decades, gender-variant communities have existed in the region for centuries. Following its use by transnational HIV/AIDS developmental funding programs in the 2000s, *trans* (expressed and institutionalized more often as *transgender* in South Asia) was adopted as an umbrella term by local communities and social

movements. This expansion of the term produces some conflicts between universalizing conceptions of trans identities and regional/local gender-sexual configurations and knowledges.

Contextualizing Regional Trans Formations

The use of the term *transgender* in South Asia has been prevalent since the early 2000s in its more popular form "TG" and was associated primarily with culturally recognized and historically documented *hijra* (India and Bangladesh), *meti* (Nepal), and *khwaja sira* (Pakistan) communities. There are further regional variations; hijras are also known as *kinnars* in North India, *shivshaktis* in Andhra Pradesh, *aravanis* in Tamil Nadu, and *jogtas* in Maharashtra. These communities comprise male-assigned, feminine-identified people who form distinct kinship networks/clans and perform ritualized blessings during weddings and childbirths or are pushed into sex work and begging. Under British colonial rule, these communities were collectively designated as "eunuchs," conflating hijras and intersex people, and included under the so-called Criminal Tribes Act of 1879, which categorized and persecuted some minoritized groups as habitual criminals. This legacy lives on today in the criminalization of begging and sex work, as well as the surveillance of gender-variant individuals, especially working-class and oppressed-caste people.

Historically, these communities have been constructed as a native "third gender" and have sought recognition as such. In 2007, the Supreme Court of Nepal granted fundamental human rights to gender-variant people by establishing *third gender* as a legal category alongside "male" and "female," and the term *third gender* was included on the Nepal Census in 2020. Similarly, legal recognition was granted in 2009 to khwaja siras in Pakistan and in 2013 and 2014 to hijra communities in Bangladesh and India, respectively. While considered a welcome development by many, it nevertheless forced hijras and other gender-variant people to classify themselves as "others" who are compulsorily outside the male/female rubric, and in the case of Bangladesh, "third gender" came to be coded as a disability pertaining to innate genital difference. At the same time, the courts in Nepal and India accepted people's self-definition of their gender identity.

Scalar Encounters: MSM, Trans, and HIV/AIDS Funding

Since the mid-2000s, *trans* has come to signify a broader term encompassing myriad gender-nonconforming identities and embodiments in South Asia. This more expansive iteration of the term occurred through transnational HIV/AIDS prevention programs targeting high-risk men who have sex with men (MSM)—a neologism devised for men who have same-sex relations but who cannot be categorized as "gay" or "homosexual." However, local and regional agencies included not just MSM but also effeminate male-assigned individuals, *kothis,* as part of their outreach. These networks of feminine-identified, male-assigned people were already in existence prior to the moment of "global queering" in South Asia but now gained institutional traction within the epidemiological taxonomy and political economy of "MSM."

The proliferation of "transgender" in HIV/AIDS interventions beginning in the mid-2000s resulted from the United Nations Development Programme's funding guidelines that sought to separate sexual orientation from gender identity. As a result, myriad feminine gender-nonconforming groups, such as hijra, kothi, and *dhurani,* were subsumed under the umbrella term *transgender,* which became the universalizing, hegemonic term to denote gender variance in South Asia. The use of *transgender* has bestowed legibility to the multitude of gender-nonconforming communities, but it has also minimized them as mere "local" variations.

Centering Trans Men

In addition to subordinating extant gender/sexual formations and terminology within the scalar hierarchy of transnational, national, and local, "transgender" in South Asia has also relegated trans men to an afterthought. Although regional terms for trans men such as *thirunambigal* (Tamil Nadu), *gandabasaka* (Karnataka), and *bhaiya* (North India) have been in circulation, many trans men's networks in India until the mid-2000s were primarily embedded in community-based groups that focused on lesbians, bisexuals, and trans men (LBT), with the exception of Sampoorna (a group dedicated to trans and intersex people). In response

to the nearly exclusive focus on gay men, hijra, and transfeminine people within HIV/AIDS prevention programs and in the broader urban LGBTQ+ social movement, these LBT groups maintained their commitment to lesbians, bisexual women, and FTM (female-to-male) people—seeing them as existing within a continuum of gender expressions among persons assigned gender female at birth (PAGFAB). This terminology had a mixed reception among trans men in India, with some finding it a biologically deterministic framework that counterproductively tethered trans masculinity to femaleness and others regarding it as an accurate descriptor of their gender transition. In the wake of the court verdicts recognizing "third gender," trans men in India, Bangladesh, Pakistan, and Nepal sought legal affirmation and rights alongside hijras, khwaja siras, and metis within the ambit of "transgender." In India and Nepal, trans men's networks and groups have flourished since, yielding a stronger and more organized transmasculine voice that is no longer collapsible into "LBT."

Trans Legislation

In 2016, the push for trans civil rights led the Indian government to table a bill with the double-speak title, "The Transgender Persons (Protection of Rights) Bill." This bill undid the right to self-define one's gender identity as ruled by the Supreme Court of India in 2014 and instituted District Screening Committees that would ratify applicants' gender identity. The bill also failed to provide any protections against discrimination and effectively criminalized the most vulnerable hijra livelihoods (begging and sex work), as well as their kinship networks. Despite stiff and widespread opposition to the bill by multiple trans organizations and individuals, it was passed in 2019. Thus, while trans rights have come a long way in South Asia, and there is tremendous diversity in governmental approaches, the increased visibility and legislative uptake of trans people's condition have not necessarily meant liberation or empowerment.

STAR

STAR (Street Transvestite Action Revolutionaries) was a multiracial trans liberation group organized in 1970 by Sylvia Rivera and Marsha P. Johnson within the Gay Liberation Front (GLF) of New York. Street transvestites, as the founders referred to themselves, helped create the gay liberation movement, attending GLF meetings, marching, and finding common cause with Gay Youth led by activist Mark Segal. They fought on behalf of those rendered vulnerable due to trans identity, youth, sexuality, race, ethnicity, and poverty. STAR also established a shelter for gender-variant youth who often found themselves homeless or otherwise without support.

STAR's militant outlook was shaped by childhood motifs of community, family, and identity. Rivera, then 12, met Johnson, then 17, panhandling on Manhattan's 42nd Street. In flophouses, high or sober, street transvestites talked politics and discussed their inherent rights as human beings. They experienced homelessness, family rejection, police confrontation, risk of imprisonment, racism, and violence. Trans activists were allies of androgynous street kids who participated in the 1969 Stonewall Riots, as did Johnson.

GLF activist Bob Kohler recalled that Johnson, an African American "street queen," was a force

unto herself. Rivera's Puerto Rican and Venezuelan background sharpened her acute awareness of discrimination and oppression. Trans activists created STAR because they were used, but not always respected, by other gay liberationists.

STAR's platform addressed prison abuse, an inimical legal and mental health system, and discrimination. It insisted on self-determination; the right to "be gay, anytime, anyplace . . . free physiological change and modification of sex on demand"; and freedom of dress and adornment. STAR opposed "job discrimination against transvestites of both sexes and gay street people" as well as exploitation by doctors and psychiatrists. The platform called for "free education, health care, clothing, food, transportation, and housing" and a "full voice in the struggle for liberation of all oppressed people." Equally telling was the proposition to end "exploitation and discrimination against transvestites within the homosexual world" (quoted in Jay & Young, 1992, p. 364).

STAR picketed with GLF and Gay Activists Alliance (GAA), publicized inmate mistreatment in prisons and mental institutions, and helped create the Gay Community Prison Committee. As many as 30 people regularly attended STAR meetings. Rivera was president and Johnson vice president. Outreach included articles, newspaper listings, flyers, demonstrations, conferences, gay liberation meetings, and word of mouth.

Homeless trans activists resolved to create a trans shelter after the gay liberation occupation and eviction from New York University's Weinstein dormitory. They founded STAR House on the Lower East Side of Manhattan. A STAR member known as Bubbles negotiated $200 rent with a gay Village mafioso. STAR House sheltered a rotating community of 15 to 25 young gender-nonconforming youth with their apparel crammed into four rooms.

Political posters (e.g., "Free All Political Prisoners" and "Free Angela Davis") adorned the walls. A scarlet STAR banner, hoisted at marches, sat folded. Residents included Rivera, Johnson, Bubbles Rose Lee, Andorra, Bambi L'Amour, Miss Pixie, Black Bobbie, Pookie (a drug-dealing security guard), and Pearlie May. They were guarded by the sanctity of colorful saints. Martha, protectress of transformation, shielded them from discovery and harm. They relied upon sex work and food "liberated" from the supermarket. Although potentially lethal, a combination of methadone and liquor was their cocktail of choice. Johnson was determined to break the cycle of drug use and homelessness via education.

From 1970 to 1973, STAR engaged in confrontational activism. Trans activists participated in gay liberation demonstrations, the Black Panther's People's Revolutionary Congress, and a Young Lords march. STAR members in numerous public protests reportedly chanted, "Go Left! Go Gay! Go Pick Up the Gun!" as did others, including the anti–Vietnam War Gay May Day Tribe.

Rivera and her close friend Bebe Scarpi, active in the Queens Liberation Front, attended city hall hearings on gay rights bill Intro 475 sponsored by the GAA. During her testimony, Scarpi quoted Jefferson's words inscribed on the ceiling, "Equal and exact justice to all men of whatever state or persuasion." Intro 475 failed; protests ensued. Rivera, high on "speedballs" after a night of hustling, kicked off her heels, braced herself with a swig of alcohol, and scaled city hall to cheers and chants. Climbing and praying, she reached a narrow ledge. The police exhorted her to jump and avoid arrest. She was jailed.

A maelstrom of ideological disagreement, personal demons, and ongoing hardship proved overwhelming to Rivera. The June 1973 Christopher Street Liberation Day March exposed deep ideological rifts based upon identity politics. The National Gay Task Force advocated an assimilationist path of incremental civil rights. Lesbians fighting sexism condemned drag and began to espouse separatism. The march organizers attempted to ensure harmony, but the plan backfired. Rivera—wearing the jumpsuit of deceased close friend June Bartel and fueled by alcohol and journalist Arthur Bell's hotheaded exhortation—stormed the stage at the Washington Square Park rally.

Rivera admonished the restive crowd to quiet down. Met by jeers, her voice rang out, demanding to know if they had been beaten up, raped, and jailed—as she had. She explained that trans women struggling to transition wrote STAR. She decried a society and prison system in which she had been raped by straight-identified men. She asserted the rights of forgotten gender-variant street youth. Her voice breaking, she called for "Gay Power."

Broken-hearted, Rivera retreated from the movement. Johnson, adorned in flower power finery, persevered, but without Rivera's raw rage and deft leadership skills, STAR faltered. Gay and trans liberation groups that had endeavored to end institutional oppression and overthrow the system gave way to organizations intent on winning gay rights. Even after STAR's disbandment and the subsequent death of its two leaders, it continues to inspire scholars, filmmakers, and transgender activists.

STEALTH

Stealth is a term describing trans-identified people who do not disclose their trans status, so that most or all of the people in their lives do not know they are trans. Going stealth is related to passing—when a trans person's gender identity is properly recognized by others—particularly since both practices typically entail compliance with dominant gender norms. Yet while passing can be unintentional or sporadic, stealth usually connotes a deliberate and thorough practice. We might also relate stealth to the notion of being closeted. This entry shows how medical and legal regulations specific to trans populations, along with the roles that race and class play in gender norms, help distinguish going stealth from the more general concept of being closeted and position stealth as a regulatory practice in itself.

Although medical standards did not create the concept of passing or going stealth, the development of a formal diagnosis and treatment plan for trans people strongly reinforced such practices. Medical providers used these diagnostic guidelines, which were codified in the *Standards of Care* first published in 1979, as criteria for treating trans patients. In turn, trans people who sought medical care had to meet the criteria in order to be considered viable candidates for medical transition, including approved access to hormones and surgery. One significant benchmark was known as "real-life experience" or the "real-life test," which specified that before being allowed to medically transition, a trans person must demonstrate that they could maintain employment, healthy social interactions, and all other aspects of daily life in the gender role they wished to transition to. Such medical requirements contributed to wider perceptions that trans people wanted—and should work toward—a definitive break between their pretransition and posttransition lives.

The real-life test had several broad effects. It put many trans people at great risk by demanding adherence to strict gender roles while neither allowing medical transition nor intervening to counter the systemic discrimination and violence against gender-nonconforming people. It relied on individual medical providers' own views of what successful femininity and masculinity looked like, views that frequently both depended on and reinforced stereotypical binary gender norms. And it conveyed that successful trans people were those who were willing and able to completely erase their gendered pasts and conceal their trans status in order to pass as cisgender in every instance.

In its 2011 revision, the *Standards of Care* stopped specifying particular criteria for a real-life experience. But the requirement's effects had already moved well beyond the medical context. For example, many media representations, including trans autobiographies, have echoed the idea of making a clean break from one's previous

gendered life and have valorized the ability to avoid being perceived as trans. At the same time, part of the broader cultural investment in going stealth is the related notion that one's trans status will eventually be detected. Many film and television representations, for instance, dramatically reveal a character as trans; the shock and spectacle of these narratives bolster common beliefs that trans people are hiding something that can eventually be discovered.

Many trans people have limited access to formal health care, and many engage medical transition through informal or less regulated avenues. Thus, the medical industry's standards are only one possible factor in the decision to go stealth. It can also be a strategic response to widespread violence and discrimination. In this sense, the complete concealment of one's trans status may be, or be perceived as, necessary to gain employment or prevent being fired, to secure housing, to avoid violence or harassment, or to maintain personal or professional relationships.

The ability to live stealth is unevenly distributed. In the most basic sense, it can entail the challenge of rewriting of one's personal history. This may be the case, for instance, for trans men who attended women's colleges or participated in certain gendered sports, or for trans women who held gendered roles in the workforce or military service. Living stealth also depends heavily on one's ability to be perceived by others as cisgender, which is frequently aided by access to medical care and to wealth. In some cases, ensuring that one's past gendered life is effectively erased may require moving to a new location and starting over with a new job—actions that are often more available to those with formal education, financial stability, and no criminal record, among other privileges.

Moreover, the ability to pass without question generally requires adherence to gendered norms that encompass other aspects of our lives, such as race, class, and sexuality. Dominant norms of masculinity and femininity are based on standards of whiteness, wealth, and heterosexuality. This would include physical appearance (including hairstyle, height, and body size and shape) as well as behavioral norms such as how we walk, shake hands, speak, and interact with others. To be recognized by medical providers, employers, landlords, social service providers, and others as "properly" feminine or masculine means complying with racialized and classed standards for those categories. Additionally, in a social context structured by binary gender norms, going stealth is rarely an available option for those whose gender identity departs from those norms.

While recognizing its strategic benefits for some individuals, then, many trans scholars and activists have also critiqued the practice of going stealth. Stealth is a difficult and often impossible status for many trans people to achieve. It can demand that trans people adhere even more closely to normative gender roles than cisgender people do. And it can reinforce medical, legal, and social understandings of gender as a straightforward, rigidly enforced binary system, which in turn disciplines all gendered subjects.

Stonewall Riots

The Stonewall Riots, a series of New York City protests with significant trans participation, began in the early morning hours of June 28, 1969. The riots erupted after police raided the Stonewall Inn, a popular gay bar with clientele that included cross-dressers, drag queens, street queens, transvestites, and transsexuals. During the uprising, which lasted until July 3, thousands of trans, cis, lesbian, gay,

bisexual, queer, and straight people fought back against police persecution, business exploitation, and social condemnation. In the aftermath of the riots, the LGBT movement mobilized, diversified, and radicalized. In subsequent years, the rebellion was commemorated around the world with pride marches and parades. The riots are generally understood as a turning point in LGBTQIA+ history and an iconic moment in struggles for gender and sexual justice.

Before Stonewall

The Stonewall Inn, founded in the 1930s, was located at 51–53 Christopher Street in Greenwich Village. The Village, a lower Manhattan neighborhood, was home to a large number of immigrants, workers, artists, bohemians, leftists, and LGBTQIA+ people. The Stonewall did not have a queer or trans reputation until 1967, when four men with organized crime affiliations, at least one of whom was gay, transformed it into a gay bar. In this period, gay bar guides listed more than a hundred LGBT-oriented businesses in New York City. Although the guides did not generally describe the Stonewall as a drag bar, many trans people frequented the bar, and many gay, lesbian, and bisexual people transgressed dominant gender norms. Most of the Stonewall's patrons were probably white and middle or working class, but African Americans and Puerto Ricans also frequented the bar, and some patrons were poor and/or homeless.

There are multiple theories about why the police raided the Stonewall. Police raids on gay bars were common in this period, and local authorities often targeted those they associated with illicit sexual activity or cross-gender expression. Bar owners and managers commonly paid off the police to avoid harassment and closure, but sometimes the corrupt arrangements broke down, especially when police demanded higher payments. Some accounts indicate that the raid occurred because the Stonewall was violating liquor licensing laws or endangering public health. Others suggest that it happened in the context of investigations into police corruption, sex work, sex with minors, or blackmailing conspiracies. The timing also coincided with a mayoral election campaign; public officials often used anti-vice crackdowns to strengthen their appeals to voters. On a national scale, the election of Richard Nixon to the U.S. presidency in November 1968 and his inauguration in January 1969 likely emboldened the police, many of whom welcomed his "law and order" politics, rejection of liberal reform, and support for traditional moral values.

The Riots

Regardless of the reasons for the raid, the Stonewall's patrons responded with campy courage and forceful fury. When the raid began on Saturday morning, there were approximately 200 people in the bar. As was often the case in gay bar raids, the police singled out individuals who transgressed gender norms or engaged in public displays of affection; they also targeted sex workers, people of color, immigrants, bar employees, and people who challenged their authority. The police ordered most of the patrons to exit the bar, but instead of dispersing, the latter formed the core of an unruly crowd that gathered on the streets and sidewalks nearby. When the police subsequently attempted to leave the Stonewall with several people in their custody, the multiracial crowd erupted, throwing coins, stones, bricks, cans, bottles, and other objects at the police and bar.

There are conflicting accounts of who first fought back against the police. Some point to Stormé DeLarverie, variously identified as mixed race, African American, lesbian, and trans. Some single out other trans and genderqueer people, including Jackie Hormona (European American), Zazu Nova (African American), and Miss Major Griffin-Gracy (African American). Two gay transvestites, Marsha P. Johnson (African American) and Sylvia Rivera (Puerto Rican and Venezuelan), are often credited with initiating the riots, but although they definitely participated in subsequent developments, they likely were not there when the uprising began.

Regardless of who fought back first, multiple sources highlight the defiant resistance of trans people, street youth, sex workers, and people of color. Soon after the crowd erupted, the police retreated inside the bar, which several protesters unsuccessfully tried to light on fire. The police escaped after reinforcements arrived, but over the next several hours, they battled the protesters for

control of the nearby streets. Renewed battles erupted on Saturday night, smaller skirmishes occurred on the next 3 nights, and a final night of intense conflicts exploded on Wednesday night (July 2–3). More than 20 people were arrested over 6 days, several people were seriously injured, and there was extensive property damage inside and outside the Stonewall. In the months and years that followed, Stonewall was celebrated and commemorated for contributing greatly to the growth and success of the LGBT movement.

Historical Frameworks

Historians have used several frameworks for interpreting the Stonewall Riots. First, there is the notion that the riots built on the growth of the LGBT movement in the 1950s and 1960s and the rise of LGBT militancy in the late 1960s. By 1969, the LGBT movement could point to two decades of important achievements and a 5-year wave of direct action protests. Some homophile demonstrations marginalized transgressive gender expression, but others foregrounded trans empowerment. In 1965, for example, activists conducted two sit-ins at Philadelphia's Dewey's restaurant to protest denials of service to gay, lesbian, and trans patrons. In 1966, trans people demonstrated and rioted after they were mistreated at San Francisco's Compton's Cafeteria. A short time later, trans activists, sex workers, and homeless youth in San Francisco participated in a "Sweep-In" to highlight conditions on the streets. In 1967, Sir Lady Java, an African American trans woman, organized a protest at the Redd Foxx Club in Los Angeles after her employment as an entertainer there was discontinued. The Stonewall Riots thus can be interpreted as the culmination of two decades of LGBT activism and 5 years of LGBT radicalization.

Second, the Stonewall rebellion can be viewed as an outgrowth of more than a century of bar-based resistance practices that LGBTQIA+ people had used to challenge oppression. As well-known sites of congregation for gender and sexual "deviants," gay bars had long been vulnerable to harassment and violence by hostile outsiders and state authorities, who often targeted trans and genderqueer people. Resistance took many forms, some of which included physical and verbal confrontations with the police. Some pre-Stonewall commentators had predicted that it was only a matter of time before LGBT people followed the lead of other oppressed communities in rioting against police persecution. Police raids on three Los Angeles gay bars (the Black Cat and New Faces in 1967 and the Patch in 1968) led to major demonstrations, the largest of which included several hundred protesters. From this perspective, the Stonewall Riots can be understood as extending a long tradition of LGBT bar-based resistance practices.

Third, the Stonewall uprising can be situated in the context of social movement radicalization and the influences of antiwar, Black Power, countercultural, and women's liberation activism on LGBT communities. In the years leading up to the Stonewall Riots, mass mobilizations against the Vietnam War had radicalized many Americans. The Black Power movement had challenged the ideologies and strategies of the civil rights movement. Countercultural activism had critiqued dominant norms related to gender, sexuality, and the body. Women's liberationists had challenged liberal feminism and revolutionized the struggle against gender oppression. LGBT activists participated in these and other movements, absorbed their messages and meanings, and applied them to the situations they faced. In particular, LGBT people were influenced by the Watts rebellion of 1965, when African Americans in Los Angeles rose up against the police, and the eruption of multiple urban riots in 1966, 1967, and 1968. From this perspective, the Stonewall Riots can be interpreted as an important episode in the larger history of movement radicalization and urban protest in the late 1960s.

Fourth, historians have interpreted the Stonewall rebellion by making use of a contested sociological theory, often associated with the work of political scientist James Davies, about why political uprisings happen when they do. According to Davies, riots and revolutions frequently occur when a long period of improving social conditions is followed by rapid reversals; the resulting gap between rising hopes and dashed expectations can create revolutionary situations. This theory can be applied to LGBT history in the 1960s. In the pre-Stonewall era, LGBT social conditions had improved. The U.S. Supreme Court ruled against postal censorship of several gay-oriented publications. Illinois

and Connecticut repealed their sodomy laws. California, New York, and New Jersey courts granted limited victories to gay bars. New York City officials promised to suspend the use of sexual entrapment practices by the police. Los Angeles police agreed to stop enforcing its ban on cross-gender impersonation by entertainers.

In the months leading up to the Stonewall Riots, however, conditions took a turn for the worse. Nixon's election was ominous for communities that had benefited from liberal reforms but were vulnerable to police persecution. New York's mayor, generally seen as more gay-friendly than his political opponents, lost the Republican primary in his bid for reelection. *Drum,* the country's most popular gay movement magazine and a supporter of trans rights, was forced to cease publication after raids on related pornography businesses. In California, two gay men were killed by police and another man died after he was beaten by police in a public bathroom. Trans people, people of color, and poor people had reasons to fear that they would be increasingly vulnerable to police violence and state repression in the Nixon era. These and other factors aligned with the Davies theory may have contributed to the Stonewall Riots.

After Stonewall

In 1969, news about the riots spread through various types of communication networks. Media reports, when used alongside oral histories, can be helpful for thinking about trans participation in the rebellion. Some of the earliest stories in New York's mainstream press described the rioters as "homosexuals," but a week later, they also began depicting them as "gays," "fags," "fems," "girls," "nellies," and "queens." Alternative papers such as the *Village Voice* used many of the same terms but also referenced "fairies," "swishes," "dykes," "queers," and "sex changes." Confounding the notion of clear sexual boundaries, the author of a first-person account in the *East Village Other* described himself as neither gay nor straight.

Further confounding common expectations, two trans periodicals, the *Erickson Educational Foundation Newsletter* and *Transvestia,* did not cover the riots, but the gay-oriented *Mattachine Society of New York Newsletter* highlighted the roles of "sissies," "swishes," "drags," and "queens" in the uprising. Adding to the complications of interpretation is the fact that the words and concepts of 1969 do not always align with later words and concepts. In Stonewall's aftermath, for example, Sylvia Rivera and Marsha P. Johnson founded Street Transvestites for Gay Power, suggesting that they identified as gay and trans. More generally, homosexuality was commonly associated with gender inversion in this period, meaning that many references to "homosexuals" were understood to include trans people.

Debates and discussions about trans participation in the Stonewall Riots continued in subsequent years, especially in the annual pride commemorations that began in 1970. In some contexts, trans people were represented and recognized; in others, they were marginalized and excluded. Conflicts about this have often served as proxies for larger debates about LGBTQIA+ politics. These discussions also have influenced ongoing processes that construct and reconstruct boundaries, alliances, and coalitions within and beyond LGBTQIA+ communities. With so much at stake in these conversations, many have found it challenging to strike the right balance so that the roles of trans people in the Stonewall Riots are neither erased nor exaggerated.

After the Stonewall uprising, trans people participated actively in the growth and development of the gay liberation, lesbian feminism, trans liberation, and LGBTQIA+ movements. Although their contributions to the Stonewall Riots have not always been sufficiently acknowledged, trans people have forcefully argued for their recognition. They did so in 2013, when U.S. President Barack Obama declared in his 2013 inaugural address that "we, the people, declare today that the most evident of truths—that all of us are created equal—is the star that guides us still, just as it guided our forebears through Seneca Falls, and Selma, and Stonewall." They continue to do so in the aftermath of Obama's 2016 official designation of the Stonewall National Monument at the site of the 1969 Christopher Street riots.

Substance Use

Trans people experience a high rate of substance abuse and dependence, which includes alcohol, tobacco, marijuana, other illicit drugs, and nonmedical prescription drug misuse. It is difficult to know the exact prevalence of substance use among trans people, as much of the data gathered from LGBTQ populations do not effectively separate out trans people. It is clear, however, that trans people experience very high rates of substance abuse and dependence—two to three times the rate of cisgender (cis) people. Disparities in substance use by gender identity are found as early as adolescence and across racial and ethnic groups.

Substance Use and Misuse

The 2015 U.S. Transgender Survey reported high rates of substance use among survey respondents. One quarter reported marijuana use in the past month. Seven percent reported using prescription drugs inappropriately, and 29% reported that they had used illicit drugs at some point in their lifetime. All of these types of substance use were substantially higher than have been reported in the general population, and use was highest in those individuals who reported working in the underground economy. Binge drinking, heavy drinking, and tobacco use were also reported more frequently than in the general population, particularly in those who reported underground work.

Not all substance use is the same. Many individuals use substances for recreation or for coping in ways that are not necessarily problematic. This is true both for legally available substances, such as alcohol and cigarettes, and for marijuana and illicit drugs. Substance use is considered problematic when it interferes with activities of daily life and relationships. From a diagnostic perspective, individuals are considered to have a substance use disorder if they have at least three concerns related to substance use—including experiencing withdrawal, cravings, and spending a lot of time using or recovering from a substance. A person does not have to have a diagnosed substance use disorder for their use to cause problems in their day-to-day lives. Trans individuals have elevated rates of substance use disorders as well as general substance use.

Gender Minority Stress and Substance Use

The increased risk of substance abuse and other forms of self-harm among trans people are not thought to reflect any inherent risks associated with being transgender but rather the difficulty of being transgender in a society that is often neither accepting nor affirming. Across both personal and professional domains, transgender people are exposed to many kinds of discrimination and stress, which may have a negative effect on health outcomes. The minority stress model is often used to explain how discrimination affects the health of minority populations, such as transgender people.

The gender minority stress model acknowledges that trans and gender-diverse individuals are at risk of experiencing acts of discrimination and rejection, such as harassment, violence, and discrimination. These external stimuli can lead to internal and subjective experiences such as identity concealment, internalized stigma, and expectation of rejection. Finally, both external and internal forms of stress can increase the risk of adverse health outcomes. These increased risks are both biological and behavioral, and one of the mechanisms through which stress can lead to negative health outcomes is through the development of

unhealthy coping behaviors, such as substance use. Minority stress may be further increased for individuals who experience multiple-minority status, such as trans women of color. Some studies have also reported higher rates of substance use among binary and nonbinary transfeminine youth.

Protective Factors

Not all trans individuals are at equal risk of developing substance use disorders. A number of factors have been identified that may protect individuals from experiencing problematic substance use. As would be expected from the minority stress model, many of these factors are those that reduce either the exposure, to or impact of, minority stress. Protective factors include being able to affirm one's gender and having adequate family and social support. Positive identification with a group also reduces risk, by increasing individuals' sense of belonging.

Co-Occurring Disorders

Substance use and misuse often co-occur with other important factors, such as HIV infection, mental health issues, and interpersonal violence. These should be considered related issues that, when they occur together, multiply both physical and mental health risks for transgender people. For example, injection drug use may increase the risk of infectious diseases, such as HIV. Depression and anxiety may make it more difficult to seek treatment or engage in other protective behaviors.

Issues With Substance Use Treatment

It can be difficult for transgender people to access safe, affirming substance use treatment. Trans individuals frequently report delaying or avoiding substance use treatment because of fears of maltreatment by providers or staff. Residential and/or inpatient treatment may be particularly difficult for trans patients to safely access, as it is often sex segregated, and programs may be resistant to housing patients according to their affirmed gender. This may be particularly problematic in states that do not have public accommodation laws, although even in theoretically affirming states, programs may still put up barriers. Programs may also have issues providing continued access to gender-affirming hormones during substance use treatment, despite the fact that doing so is critical to patient well-being.

In addition to issues with accessing treatment, the content of substance abuse treatment programs may also not be ideal for working with gender-diverse patients. Treatment, if not carefully created with the minority stress model in mind, can often focus more on minority status than on substance use. Training in working with transgender-diverse patients is not routine, and many counselors and staff members are poorly prepared to work with this population. Larger cities may offer treatment programs targeted to sexual and gender minority patients, and there are several facilities in the United States specifically geared to working with these populations. Where specialized programs are not available, treatment programs should be at minimum trauma informed and gender affirming.

Suicidality and Self-Harm

Death by suicide is the 10th leading cause of death in the United States, with rates rising over a 20-year period beginning in the early 2000s. While the trends related to death by suicide in the United States are generally concerning, rates of suicidality—suicidal ideation, attempts, and death by suicide—are disproportionately higher within trans populations relative to cis populations. Rates of self-harming behavior (also referred to in the literature as nonsuicidal self-injurious behavior [NSSI]), a common precursor to suicidality, are also disproportionately high within trans populations.

Given these concerning trends, researchers and health practitioners have sought to gain accurate estimates of the prevalence of suicidality within trans populations and to identify correlates of suicidal behavior to improve mental health supports. Some of these efforts are associated with intervention at the individual level by attending to psychological comorbidities associated with suicidality, such as NSSI or depressive symptoms. Other efforts are focused on identifying interpersonal and systemic risk and protective factors across various social contexts, such as experiences of peer and/or familial rejection, discrimination, harassment, and school-based victimization.

Gaining a more nuanced understanding of suicidality among trans populations is needed to better inform prevention and intervention efforts. Therefore, researchers have also sought to identify variations in the prevalence of suicidality and associated risk across diverse gender identities (e.g., gender nonconforming, genderqueer, nonbinary, trans man/trans woman). Notably, this is a field of study that garnered increased attention over the first two decades of the 2000s, yet there is still much that is not well understood. This entry addresses the theoretical frameworks that inform studies on suicidality within trans populations, the prevalence of suicidality across diverse gender identities, methodological limitations on what is known about the prevalence and correlates of suicidal behaviors, and factors that increase the risk of or protect against suicidality and self-harm.

Theoretical Frameworks for Understanding Suicidality Among Trans Populations

Two pivotal frameworks associated with mental health and suicidality have been instrumental in improving our understanding of suicidality within LGBTQIA+ communities (as discussed in the section on methodological limitations, gender identity is rarely considered independently of sexual orientation in the existing literature on suicidality). The first, Interpersonal-Psychological Theory (IPT), is a general theoretical framework developed by Thomas Joiner, a clinical psychologist specializing in suicidality. A central tenet of IPT is that suicidal behaviors are preceded by the desire to die. This desire typically emerges from two psychological traits: first, *perceived burdensomeness,* in which a person feels they are a burden to their friends, family, or society and that others would be better off without them, and, second, *thwarted belongingness,* in which a person feels socially isolated or that they are not a valued member of their family, peer groups, or community.

Joiner cautions that people tend to engage in riskier and more harmful behaviors, including NSSI, as a way to "work up" to suicide—that is, to work against the innate drive to protect oneself from death. NSSI is a common precursor to suicidality and can be an escalating behavior to which people become habituated. Those who engage in this behavior may therefore seek more extreme ways to harm themselves in order to get the same feelings of relief or pain. Recognizing NSSI as a risk factor associated with suicidality offers an important marker for intervention. It should be noted, however, that individuals who self-harm are not necessarily, and may never become, suicidal. Other reasons for higher rates of self-harm among trans people are discussed later in this entry.

The second theoretical framework, Minority Stress Theory (MST), was proposed by Ilan Meyer. This theory provided a major advancement in our understanding of mental health disparities that emerge from experiences of discrimination and victimization because of people's status as sexual or gender minorities. Non-heterosexual sexual orientations and trans identities having been historically classified and treated as mental health disorders led to early studies and treatment of suicidal behaviors among trans people to be focused on psychopathology—that is, treating divergent sexualities and gender identities as primarily a mental health issue within an individual. This conceptualization of non-heterosexual/non-cisgender (cis) identities therefore drew attention away from the root causes of mental health disparities among LGBTQIA+ populations. MST emphasizes that mental health disparities emerge as a result of exposure to stressors associated with social rejection, discrimination, and victimization and not as an inherent trait associated with identifying as a person with a minoritized sexual orientation or gender identity.

Using both IPT and MST offers a helpful way to better understand disparities in suicidal behaviors among trans populations. Specifically, these frameworks contextualize why trans people are at higher risk for suicidality and to recognize warning signs (e.g., NSSI) to inform prevention and intervention efforts. However, identifying these risk factors has historically been hindered by various methodological limitations.

Prevalence of Suicide

An increased focus on factors that negatively affect the mental health of trans people throughout the 2010s paints a clear picture of heightened risk for self-harming behavior and suicidality among trans people relative to the general population. As of the late 2010s, rates of suicidality in the general U.S. population were estimated to be around 4% for suicidal ideation and 0.6% for attempted suicide, with over 47,000 deaths by suicide in 2017. These rates vary by both age and gender (e.g., rates of suicidal ideation are highest among adolescent girls, and rates of death by suicide are highest among men over the age of 50). Although there is fairly wide variability in estimates of the prevalence of suicidality among trans people, estimates are consistently higher relative to the general population: An average of 56% (ranging from 29% to 97%, depending on the study) of trans people report lifetime suicidal ideation, and 29% (ranging from 11% to 52%) report having attempted suicide in their lifetime. Although limited in scope, a handful of studies outside of the United States find similar prevalence rates. For example, in both Australia and England, nearly 50% of trans people report having attempted suicide.

One of the first population-based studies to include a measure of gender identity, based on California middle and high school youth, found that 34% of trans youth seriously considered attempting suicide in the past year, relative to 19% of cis youth. Additionally, this study highlighted that both depression and victimization partially explained the relationship between gender identity and suicidality. These findings were reflective of another population-based study conducted in New Zealand, in which 20% of trans youth had attempted suicide in the past year, relative to only 4% of cis youth.

Unequal Risk Across Gender Identities

Current literature on suicidality highlights sex differences in suicidality between cis men and women, with cis men being more likely to die by suicide and cis women being more likely to attempt suicide. Recognizing these differences is important for informing targeted interventions. Given historical trends in studies related to suicidality among trans people, little is known about disparities in suicidality within trans populations. Nevertheless, studies in the later 2010s started to examine rates of suicidality across gender identities.

In a large-scale study of adolescents between the ages of 11 and 19 that included a nuanced measure of gender identity, Russell Toomey and colleagues found that among the trans youth in the study, 51% of those who identified as female-to-male (i.e., transmasculine), 42% who identified as nonbinary, 30% who identified as male-to-female (i.e., transfeminine), and 28% who reported they were questioning their gender identity reported having attempted suicide. This is in stark contrast to 18% of cis female and 10% of cis male adolescents in the sample who reported having

attempted suicide. Studies using community-based samples of adolescents and adults have also found that transmasculine and nonbinary people report the highest rates of suicidal behavior. Thus, these studies point to critical differences by gender identity that need to be further examined in order to effectively develop and target interventions designed to reduce suicidality. Qualitative research is best positioned to examine the nuances of these trends and allows those who are most at risk of suicidality to help guide the development of supports and protective factors that may attenuate these disparities.

Methodological Limitations

Attention to the mental health of trans people within the research and medical community emerged in the early 1950s. From this time until the mid-1990s, transgender health was viewed through what Walter Bockting describes as a disease-oriented lens, with focus on the "psychopathology of transgenderism" or, more simply, that deviance from normative gender identities was rooted within deeper psychological issues. Efforts were therefore focused on addressing underlying mental issues, such as through therapeutic interventions intended to decrease discomfort with a person's sex assigned at birth or to hormonally or surgically change one's sex to be congruent with their gender identity.

Such approaches ignored the experiences of discrimination and stress within various social contexts that were more likely at the root of mental health issues and suicidality. Studies began to address these contextual factors beginning in the mid-1990s. However, many of these studies through the mid-2000s considered LGBTQIA+ populations as a monolithic group and rarely differentiated between sexual orientation and gender identity (in fact, a vast majority of these studies did not attend to identities beyond lesbian, gay, bisexual, and/or trans). The few studies that did specifically differentiate between sexual orientation and gender identity were often limited in their generalizability owing to their sampling designs and small sample sizes.

Although disproportionate rates of suicidality and self-harm within trans populations are well documented, accurate estimates of these behaviors have historically been hindered by a lack of population-based studies that include measures of gender identity. This has led to wide variability in estimates of suicidality, especially in relation to gender identity. Many studies in the early 2000s tended to rely on convenience samples drawn from mental health clinics and LGBTQ organizations. Although informative, studies based on participants recruited from health clinics are limited in that they oversample those who have existing mental health concerns for which they are seeking support. Such samples may therefore overestimate actual rates of mental health issues, including NSSI and suicidality. Community-based samples, such as those recruited through LGBTQ organizations, may also introduce sampling bias in that they typically exclude participants who are not connected to such social networks. These are important considerations, as having connections to social supports is associated with better health outcomes, including those related to mental health, which could lead to underestimates of the prevalence of NSSI and suicidality among trans people.

Additionally, studies on suicidal behaviors among trans people in the early 2000s were primarily qualitative. Such studies offered valuable insight into risk and protective factors of suicidal ideation and attempts, such as experiences of discrimination and marginalization. Because of the small sample sizes of these studies, the findings were limited in their generalizability to a larger population, and it was not possible to determine the prevalence of suicidality more generally. Nevertheless, these studies provided valuable and much-needed insight into trans people's motivations for thinking about or attempting suicide, and they served as an important guide for larger-scale quantitative research.

A small number of population-based studies started to emerge in the late 2010s, providing more accurate estimates of the prevalence of suicidality within trans populations and highlighting the disparities in gender identity–related suicidality. However, there is still a paucity of studies that are population based, that accurately and comprehensively assess gender identity and expression (e.g., providing multiple options related to gender identity such as transgender, gender nonconforming, genderqueer, nonbinary), and that identify

other risk and protective factors that illuminate gender identity–related disparities in suicidality. Studies that address the complexities of gender identity (e.g., rather than just relying on gender identity self-reports, asking participants to report on their gender expression and others' perceptions of their gender) are needed to both identify populations that may be at higher risk of self-harming behaviors and better inform intervention and prevention efforts.

Our understanding of rates of people who die by suicide is also limited, especially in the United States, as death records rarely include a person's gender identity. Therefore, we know more about rates of suicidality but do not have accurate estimates of trans people who have died by suicide. Notably, studies consistently find that although cis women are more likely than cis men to have suicidal thoughts and to attempt suicide, cis men are over three times more likely than cis women to die by suicide. Recognizing these differences in the broader population, it is important to gain a deeper understanding of how rates of suicidal ideation and suicidal attempts/death by suicide vary within trans populations. For example, it is plausible that a similar pattern might be observed in that transmasculine and nonbinary people are more likely to have suicidal thoughts and to attempt suicide, whereas transfeminine people might be more likely to die by suicide. This information is vital for gaining a better understanding of the broader scope of suicidality within trans populations, especially with careful attention to the risk and protective factors associated with NSSI and suicidality among trans people.

Risk Factors Associated With NSSI and Suicidality

Research focused on suicidality that methodologically distinguishes between sexual orientation and gender identity did not begin to emerge until around the second decade of the 2000s. This lack of differentiation hinders our understanding of risk and protective factors that may be unique to trans populations. Nevertheless, qualitative studies, as well as a limited number of quantitative studies, have helped elucidate risk and protective factors associated with self-harming behavior and suicidality.

Risk factors for NSSI and suicidality within trans populations include those found within the general population, such as anxiety and depression, as well as gender identity–related experiences (e.g., gender dysphoria, discrimination). Additionally, various risk factors more salient to trans populations have been identified through both qualitative and quantitative studies. Such studies underscore that trans people have negative and stressful experiences across social contexts, including within families, schools, health services, and their communities more broadly. These negative and harmful experiences may contribute to, or exacerbate, issues related to substance use, psychological distress, and poorer physical and mental health.

Gender Dysphoria

Gender dysphoria—a feeling of dissonance between one's gender identity and sex assigned at birth, or dissonance between how one views oneself and how their gender is perceived by others—can be a substantive source of anxiety and depression. Indeed, research has found that gender dysphoria is associated with NSSI and suicidality. Yet it is important to note that just having gender dysphoria does not necessarily mean the person is suicidal. This is a very important distinction to consider in relation to Joiner's theory of suicide (IPT), which emphasizes that escalating behaviors are a warning sign for suicidality and therefore has implications for treatment and intervention. That is, clinicians should be cognizant of the unique underlying factors and motivations associated with NSSI among trans clients.

Family and Peer Rejection

As emphasized by IPT, perceiving oneself as a burden to families and friends and feeling a sense of thwarted belongingness within these groups are two primary drivers of suicidality. Various studies have identified that people who reported familial rejection because of their gender identity, including from their parents, spouses or partners, or children, report higher rates of suicidality. Those who have experienced violence within their families or relationships (e.g., intimate partner violence [IPV]) also report higher rates of suicidal ideation and

attempts. Trans people also frequently experience marginalization or exclusion from peer groups and from broader LGBTQIA+ communities. This social isolation can be especially acute for people who are nonbinary, as they may feel excluded from or marginalized within both LGBQA+ and trans communities. Therefore, while family and peer groups can be an important source of social support that tend to generally improve people's health and well-being, isolation from these groups can also result in poorer mental health.

Negative School Climates

Trans youth are more likely to be harassed and bullied at school relative to their cis peers, including those who are LGBQA+. Schools are also frequently hostile environments due to the pervasiveness of hearing anti-trans remarks from both students and teachers. These minority stressors contribute to poorer mental health outcomes, including suicidality, for trans youth. As one example, providing access to gender-inclusive bathrooms and changing rooms, which represent common spaces of harassment for trans youth, is one way to improve school climates for trans youth. Requiring professional development for teachers and staff that raises awareness and competencies around providing stronger social supports for trans youth is another avenue for creating safer and more supportive schools.

Protective Factors Associated With Self-Harming Behaviors and Suicidality

The key gender-specific factors associated with lower risk for suicidality among trans youth revolve around supporting trans people to live their lives authentically. These protective factors range from being referred to by one's chosen name and pronouns, receiving gender-affirmative support from at least one adult, access to gender-affirming spaces (e.g., restrooms that correspond to the person's gender), and, if applicable, having access to gender-affirming medical care. Much of the literature on protective factors associated with suicidality among trans youth has focused on behaviors, attitudes, or climates of youths' families, schools, and communities. A handful of studies document that these factors confer more protection for every additional context in which the factor occurs (e.g., a study by Stephen Russell and colleagues documented a marked reduction in suicidality when chosen name was used across family, school, work, and friend contexts).

Few studies have focused on intrapersonal factors that may promote resilience and lower rates of suicidality. As of the late 2010s, limited research documents that higher levels of self-compassion, for example, are associated with reductions in suicidality. Research with LGBQA+ people also suggests that having more positive feelings about one's identity is associated with lower levels of suicidality and other mental health problems. Much more research is needed, however, to identify individual-level protective factors that can be developed and fostered among trans populations living in contexts where trans negativity is the norm.

Conclusion

Higher rates of suicidality among LGBT populations are well documented. Although it is notable that a vast majority of LGB people never attempt suicide, rates of suicidality within trans populations are substantially higher than among LGB populations, underscoring a significant public health issue. Disparities in the prevalence of suicidality within LGBTQIA+ communities emphasize the importance of recognizing that experiences and risk factors unique to those who identify as LGBQA+ and/or trans necessitate targeted approaches of intervention and prevention. Tailored approaches may be particularly important given that the majority of risk and protective factors associated with NSSI and suicidality among trans populations are specific to the experiences of being a gender minority.

People who experience multiple minority stressors are at heightened risk of suicidal ideation and attempted suicide, underscoring the detrimental cumulative effects of discrimination, marginalization, and harassment. Studies conducted by Mark Hatzenbuehler and colleagues offer promising findings that anti-LGBTQ policies at the school, county, and state levels are associated with lower rates of suicidality. However, these studies have primarily focused on outcomes for LGB youth. It

is unclear whether these policies are also effective for reducing rates of suicidality within trans populations, but the limited available evidence suggests that such policies more effectively address the need of LGBQA+ people more than trans people. Beyond policy, the Trevor Project is a nonprofit organization focused on raising awareness of and providing support for LGBTQ mental health and suicidality. Such organizations provide vital resources, such as a 24-hour suicide hotline, especially for trans people who may lack them within their own communities.

Sullivan, Lou

Lou Sullivan (1951–1991) was a founding father of the FTM (female-to-male) community. He connected individuals around the world whom we today describe as being trans men, or on the transmasculine spectrum. He helped define FTM identity through his publications and advocacy work and organized community under the FTM umbrella. Sullivan was both trans and gay and had to overcome the homophobic bias of medical professionals to physically transition. He was the first trans man diagnosed as having AIDS and ensured no one could deny the existence of gay trans men after he died.

Louis Graydon (Lou) Sullivan was born on June 16, 1951, and assigned female at birth. He was the third of six children in a white middle-class family. Sullivan grew up in a suburb of Milwaukee, Wisconsin, and attended private Catholic schools.

As an adolescent, Sullivan dreamt of being a writer or a social worker for "lost boys." His first crush was the musician Paul McCartney, and he was known as the "most Beatled kid" at school. Sullivan's social consciousness developed while he was a teenager, first through the civil rights movement and later the 1960s counterculture. He had an affinity for long-haired men and enjoyed being read as one himself. Sullivan both wanted men and wanted to be one and escaped into private gay fantasies.

Sullivan never formally attended college. However, his employment as a secretary in an academic department at the University of Wisconsin–Milwaukee allowed him to conduct personal research on sexual orientation and gender identity. He spent countless hours in the university library poring over scientific literature and scanning through old newspaper articles on microfiche trying to find mention of someone like him: a gay man assigned female at birth.

In his early 20s, Sullivan joined Milwaukee's Gay People's Union (GPU). Because gay trans men supposedly did not exist, at the time, he identified as a "female transvestite," or crossdresser. Under the tutelage of cisgender gay men, Sullivan learned how to mentor, network, organize meetings, and publish a newsletter, laying the foundation for his later trans activism. He was also welcome in

Milwaukee's gay bars but at times felt guilty having sex with the men he met there, thinking that being with him required them to be heterosexual.

In 1975, Sullivan moved to San Francisco. He was one of thousands descending upon the city in what would later be called the Great Gay Migration. But Sullivan did not find the same welcome in San Francisco's gay community. In the smaller Milwaukee community, his female embodiment was not suspect because *gay* served as an all-inclusive term. The immense San Francisco population, however, factionalized into gay, lesbian, and trans communities.

Sullivan joined the transvestite organization Golden Gate Girls/Guys (GGG/G) and soon became treasurer and newsletter editor. He also applied to the world-renowned Stanford University Gender Dysphoria Program to access the medically necessary services for transitioning. They would not admit Sullivan into their program because he identified as a gay man. Through his GGG/G connections, Sullivan found medical providers in private practice willing to help him transition, and he in turn helped them by popularizing this antiestablishment approach to transgender care.

In 1980, Sullivan began volunteering with the Janus Information Facility, where he answered letters from and about trans men. Sullivan was the first—and in many cases the only—fellow trans man these correspondents encountered. This personal connection proved as valuable to them as any information Sullivan provided because it alleviated their isolation. While at Janus, Sullivan also published *Information for the Female-to-Male Crossdresser and Transsexual.* The booklet was so well received by trans men and health care providers specializing in their treatment that he published a second edition in 1985 and a third in 1990, both with updated and expanded information. In 1990, Sullivan also published *From Female to Male: The Life of Jack Bee Garland,* the biography of a gay trans journalist, social worker, and veteran of the turn-of-the-century Filipino-American War. Sullivan's research into Garland led him to become a founding member of the GLBT Historical Society, where he published the newsletter and served on the Archives Committee.

On December 6, 1986, Sullivan held the first meeting of what would become FTM International. Everyone was welcome regardless of where they fell on the transmasculine spectrum or whom they loved. Through get-togethers, the *FTM* newsletter, and Lou's tireless networking, he organized individuals around the world into a community.

Tragically, the birth of FTM International coincided with Sullivan's AIDS diagnosis, which he received at the end of 1986. It was then a death sentence, and Sullivan resolved to make his life as meaningful as possible. It had taken more than a decade to access all the services he needed to physically transition, because health care providers would not acknowledge the existence of gay trans men. He feared other gay trans men being similarly denied, especially if he was not around to advocate for them. Sullivan's diagnosis as the first trans man with AIDS compelled providers to listen to him and, in doing so, broadened their understanding of gender identity to include all sexual orientations.

Sullivan died on March 2, 1991, at the age of 39. He said he had no regrets and felt lucky to have led such an interesting life. His peers have been quoted as saying they felt lucky to have known him and credit Sullivan with fostering the trans movement. In the years following his death, the movement would gain great momentum and seemingly explode into the mainstream a generation later. As Sullivan's panel of the AIDS Memorial Quilt says, he was indeed "one man who made a difference."

Supportive Classroom Practices

In contemporary K–12 and postsecondary classrooms, habitual structures and routines enact assumptions about gender. For many transgender and/or nonbinary students, these structures and routines can be barriers to participation and wellbeing in the classroom. The supportive classroom practices discussed below are not about curriculum or pedagogy but pertain to aspects of classroom life that are often overlooked as barriers, precisely because they are routine. These practices are attendance, student introductions, and grouping and pairing. The following sections engage each of these aspects in turn, identifying how they can be a barrier to transgender and/or nonbinary students and suggesting how this may be avoided.

Attendance

For reasons ranging from student safety to program requirements, all K–12 and many postsecondary teachers must confirm whether enrolled students are present. Teachers access a centrally produced class list, whether downloaded on their own from an online system or received as hard copy from an administrator. Class lists are generally populated from government-issued identification such as a birth certificate, which states a student's legal name. On the first day of school or at the first class meeting, a teacher commonly reads the class list aloud or (in postsecondary) circulates the class list and asks students to append their signature or initials next to their name. These practices publicize the (often legal) name appearing in each student's institutional record. The assumption here is that a student would like to be publicly known by that name or, moreover, that publicizing it will *not* place a student at risk.

This assumption does not hold true for many transgender-spectrum students, who can be outed if their legal name does not align with others' interpretation of their gender expression and/or visible body. A student's birth-assigned legal name may be completely irrelevant to who they are today, such that being introduced to peers with this name is both invalidating and requires self-advocacy to ensure that others do not use the "real" (legal) name with which the student was initially, erroneously identified. While many North American jurisdictions allow legal name change for gender identity reasons, this can be costly and complicated, and the need to present one's self in person to apply for a name change on gender identity grounds can be a barrier if a transgender person believes they will experience discrimination or violence due to the outing this process requires. Transgender and/or nonbinary children or youth likely require parent/guardian consent to legally change their name, which may not be forthcoming. In other words, teachers cannot assume class lists contain public information.

Teachers can assume instead that *all* students' legal names are confidential, whether cisgender or not. Practices acting on this assumption include circulating a piece of paper with the first name they go by, last name, and/or student number columns for each student to fill in (with private follow-up if the teacher cannot match a name to the class list) and inviting students to create a nametag with their chosen first name, thereafter using nametags to take attendance (with private follow-up as needed, as chosen names can change).

Introductions

To cultivate a sense of community, or "break the ice," teachers commonly introduce themselves to the class and invite students to do so or to "interview" a partner using preassigned questions and introduce them to the group. As with attendance, here it is also important to explicitly invite students' *chosen* names or use an open question like, "Which name would you like to go by in this space?" instead of simply asking for names.

In recent years, and in some contexts, gender pronouns have made their way into such introductions. It is, however, inadvisable to *require* student pronoun sharing on the first day of class, as this prevents transgender-spectrum students from gauging whether this group of people can hold them safe if their pronoun comes as a surprise to others (i.e., if the act of pronoun sharing outs them). Requiring pronouns can feel like being asked to either expose one's self to risk or else to lie and thereby participate in one's own invalidation. A supportive practice for introductions is rather for the teacher to introduce themself and share their own pronouns; this is best followed by

an explicit message about why they did so (because not everyone's pronouns are "obvious," and assuming does not always yield accurate results) and a warm invitation either to come to the teacher for more information about gender pronouns or share their pronouns in confidence. If the latter happens, it is essential to be led by the student about whether and how they would like this information shared with the class.

Grouping and Pairing

Classroom life routinely sees students engaged in grouped or paired tasks. In postsecondary settings, this often happens via self-selection. Teachers may also elect to randomly group/pair students or to group/pair students for pedagogically significant reasons; both approaches result in students working with peers who may be strangers at best. An assumption of this practice is that students are necessarily safe with each other by virtue of being in the same class. However, much gender-based peer harm takes place away from teacher supervision, and requiring a transgender and/or nonbinary student to work with non-self-selected peers may expose them to harm and/or be a barrier to their participation.

It is a supportive practice to assume that a transgender-spectrum student is using their likely hard-won self-care and personal safety expertise to navigate both the classroom and broader institution in which it is situated and that they are the best judge of whom they would feel safe working with or not. In this and in many other situations, the teacher's best course of action is to consult with the student so that even a seemingly random grouping/pairing can result in a safe and comfortable learning experience.

Sylvia Rivera Law Project

The Sylvia Rivera Law Project (SRLP) is a collectively governed organization founded in 2002 that provides free legal services to trans, intersex, and gender-nonconforming people who are low-income and/or people of color. SRLP has been a leading organization articulating a racial and economic justice–centered trans politics.

SRLP was founded by Dean Spade in August 2002. Spade's initiation of the project emerged, in part, from his arrest for using the bathroom in Grand Central Station in February 2002. After news of his arrest spread, he received emails from dozens of trans and gender-nonconforming people across the United States who had experienced discrimination and police violence. Organizing around the arrest built on existing momentum in queer and trans communities responding to the June 2000 murder of Amanda Milan and the decades of efforts that had resulted, in April 2002, in the New York City Council passing legislation to extend the city's human rights law to prohibit discrimination on the basis of gender identity.

Sylvia Rivera was a long-time, multi-issue social justice activist who stood up against tranpshobia in gay and lesbian communities, participated in Puerto Rican resistance in New York City, and built community and shared survival strategies for homeless and criminalized trans and queer people.

She died in February 2002, and Spade named the project for her because of its focus on building trans liberation centering on poor people and people of color.

From the beginning, the organization was focused on trans people's experiences of criminalization and discrimination in housing, social services, legal services, health care, schools, and jobs. From the moment the organization had a phone number, it was inundated with calls from people facing crises. Community members wanted to harness the vibrant energy around the project to expand the organization's ability to meet the high level of need. Spade and others created a steering committee that researched collectively governed organizations to see how SRLP might build a structure that included governance and participation of many people rather than just being driven by a staff that was unlikely to grow quickly due to the unpopularity of trans issues to funders at the time. The steering committee shared a critical analysis of the problems of nonprofit organizations being frequently founded and run by white professionals, as well as shaping their work around the issues or tactics that interested funders rather than those that the communities being served believed should be prioritized. SRLP members were connected to feminist, prison abolitionist, and anticapitalist networks that shared an analysis that social movement organizations should not be run on the typical nonprofit model that tends to replicate many of the worst features of how businesses are organized. The steering committee designed a collective governance structure that aimed to ensure that the organization was governed by the people it served and could support the participation and mobilization of many volunteers, not just a small staff. Some noteworthy features of this model include equal pay for all staffers regardless of role or education and having no executive director.

SRLP also emerged in a time of mainstreaming of the lesbian and gay rights struggle. Spade and other members of the steering committee were part of the leftist queer and trans movement in the United States that worked to cultivate an explicitly antiwar, antipolice, antiracist, feminist, anticapitalist queer politics. They criticized the emergence of corporate-funded gay and lesbian organizations that fought for hate crime laws, marriage, and military service. They argued that the white, professional leaders of those organizations had created an agenda for reform that ignored the most urgent issues facing the most vulnerable queer and trans communities and propped up institutions that were the cause of much of this harm. The corporate-funded gay and lesbian rights organizations had mostly excluded trans issues up to this point but were beginning to slightly shift their messaging around this. SRLP became a leading voice arguing that the trans movement should not follow the pro-police, pro-military, pro-business strain of the gay and lesbian rights movement but should instead center the issues causing the most harm to trans people: poverty, immigration enforcement, criminalization, health care, and housing access.

The cases, causes, and activities that SRLP has been most known for demonstrate its political commitments. SRLP's decade of work to end the exclusion of trans health care from Medicaid in New York State is one clear example. SRLP was also vocal in opposing the REAL ID Act and other anti-immigrant legislation emerging as part of the "War on Terror." SRLP has also worked consistently to address access to homeless shelter and welfare systems and to advocate for prisoners. SRLP's 2003 report, "It's War in Here," was a significant tool in lifting up the experiences of trans women in men's prisons. In 2007, SRLP co-organized a national gathering of formerly incarcerated trans people and antiprison activists called "Transforming Justice" that bolstered this organizing work. In 2009, SRLP openly opposed federal and New York State hate crimes legislation that would have increased criminal penalties for people found to have been motivated by anti-trans bias and increase resources for police. As an organization committed to abolishing police and prisons, SRLP asserted that hate crimes legislation both failed to prevent harm to trans and gender-nonconforming people and expanded the capacity of the very systems that cause the most harm to these communities—policing and prosecution.

SRLP members also participated in Occupy Wall Street, working to integrate trans politics and the participatory anticapitalist politics of the Occupy movement. SRLP members have been vocal in fights against expansion of immigration and criminal punishment infrastructure in New York City and around the country, including in the

2018–2019 #nonewjails campaign in New York City. Throughout these decades of work, SRLP has continued to provide direct free legal services to people facing harm in shelters, foster care, jails, hospitals, prisons, public schools, welfare offices, immigration courts, and other sites of immediate harm. SRLP has also been a resource for other groups interested in creating organizational structures that are democratic, participatory, transparent, and accountable to the communities they serve, resisting the nonprofit norms that undermine social movements' growth and success.

Teacher Training and Support

Data for 2018 from the Centers for Disease Control and Prevention suggest that across the United States today, roughly 300,000 trans students fill the hallways of high schools—and they need the support of their teachers in order to succeed in their educational careers. Those same data indicate that these high schoolers are more likely to experience negative physical and mental health outcomes when compared to their cisgender peers. Students, especially trans students, may be more likely to feel supported and empowered to express their identities and interests at school if educators foster gender-inclusive environments that are affirming and help them move beyond the limitations of gender stereotyping. These types of school environments may facilitate enhanced educational outcomes and well-being of trans students. However, teachers require the necessary training and support to create gender-inclusive schools and classrooms starting as early as prekindergarten and elementary school, given that trans children can self-identify and begin social transition during their elementary school years. Training and support in this entry refer to the receipt of information from an expert in a given field who provides resources, training materials, and support that would enhance an educator's faculty to create gender-inclusive classrooms and schools. This entry consists of two sections. The first section elaborates on the importance of training teachers to create gender-inclusive classrooms and schools. The second section discusses the importance of supporting teachers as they work to create these inclusive environments.

Teachers require training to design and implement gender-inclusive practices in their classrooms and schools. This includes training on how to implement gender-inclusive language, practices, and messages in their classrooms. While there exist few formalized programs for educators, the Human Rights Campaign (HRC) Foundation—the nonpartisan research and public education arm of the world's largest LGBTQ civil rights organization—has trained more than 100,000 teachers on how to create gender-inclusive schools and classrooms through the Welcoming Schools program. Across 39 states in the United States, as well as in Canada and Mexico, HRC Foundation's Welcoming Schools Certified Facilitators conduct professional development training and provide technical assistance to educators in K–8 schools and lead systemic work in school districts. Of note is that the Madison, Wisconsin, Metropolitan School District is using the Welcoming Schools approach in 16 of its 32 elementary schools, with plans for full implementation in all 32 schools over the next 5 years. While some families are moving to Madison so that their children can attend Welcoming Schools, LGBTQ educators are also moving to Madison with the hope of a respectful work environment. HRC Foundation's professional facilitators help school staff work together to identify areas of change within the school and to

provide strategies to make sure that all students feel included. HRC's work includes training on how to intervene when students are limiting each other based on gender, how to proactively address gender-based bullying and educate students on why such bullying is harmful, and how to challenge students' ideas about gender and create environments that embrace trans students.

Teachers need formalized support as well as informal support from their administrators and colleagues to foster gender-inclusive schools and classrooms. Supporting teachers and their students may necessitate enumerating policies, such as anti-bullying policies, to include sexual orientation, gender identity, and gender expression. Allocating funds for mandatory professional development for learning gender-inclusive practices is another way in which to formalize support of teachers working to create gender-inclusive classrooms. Furthermore, making additional funds available for teachers seeking to pursue nonmandatory professional development monetizes strong support for teachers as they work to create gender-inclusive schools. Teachers will also benefit from having the support of their administrators, parents, and communities. On one hand, administrators are nicely positioned to galvanize interest and support of gender-inclusive policies and practices from an institutional level. On the other hand, parents and surrounding communities may also encourage or pressure schools to adopt policies and practices that enable teachers to more easily create gender-inclusive classrooms and schools.

Creating gender-inclusive classrooms and schools does not happen overnight. It requires many educators and students to challenge the assumptions they have about gender. With proper training, teachers can acquire the skills to create gender-inclusive classrooms and schools that support the educational growth and well-being of every student. This training may focus on providing teachers with the correct toolkit for using gender-inclusive language, creating lesson plans, and addressing and ending gender-based bullying in schools. Creating gender-inclusive classrooms and schools also requires that administrators, parents, and communities support their teachers. Administrators must provide financial support for the gender-focused professional development of teachers to undertake the task of fostering gender-inclusive schools and classrooms. Communities may also support teachers by encouraging school and local officials to implement policies that protect teachers in their efforts. Finally, investing in training and support of teachers can positively affect the education of trans children and youth—and the Welcoming Schools program lends evidence to this. According to one teacher, she was able to implement the skills she learned from the Welcoming Schools program in order to support one of her trans students. As a result, the student reported being able to focus better in school and improve his math skills by three grade levels. When teachers, administrators, and the communities they serve share the single vision of providing all children with the best possible education, the undertaking of creating gender-inclusive schools and classrooms becomes less a task of cultural shift and more of an integrated aspect of the professional and daily work of educators.

Teena, Brandon

Brandon Teena was born in 1972 and assigned female at birth. He self-identified as male in his late teens. At age 22, his trans identity was forcibly revealed by two acquaintances, John Lotter and Marvin "Tom" Nissen. They raped him and days later murdered him in a transphobic homicide on December 31, 1993. Teena (used throughout this entry as his surname) has become a symbolic figure for trans activists within the LGBTQIA+ community, highlighting the extreme violence that can be experienced by trans people on disclosure of their gender identity.

Brandon Teena's birth name was Teena Renae Brandon. His Catholic mother, JoAnn Brandon, raised Teena and his sister Tammy in a trailer park in Lincoln, Nebraska. Teena's short life was marked by tragedy and sexual violence. His father died in an alcohol-related car accident before his birth, his uncle sexually abused him during his childhood, and he was raped in high school. Teena's story has repeatedly been told through local, national, and international print, online, theatrical, film, and artistic media (e.g., a pioneering online Guggenheim art project). A documentary film was released in 1998, *The Brandon Teena Story,* which included interviews with his family, friends, police, and his killers. It also emphasized the parochial attitudes of Middle America and the hostility of the local rural community in Falls City, Nebraska, toward trans people, but the film had limited reach. In 1999, however, the Oscar-winning film *Boys Don't Cry* globally raised awareness of Teena's case and the extreme transphobic violence he experienced. Although Brandon Teena identified as male, he was referred to as Teena (his birth name) by his mother and sister, who did not understand his trans identity. Teena also struggled with his gender identity. He attempted suicide and subsequently underwent crisis counseling, which validated his trans male identity and introduced him to surgical options in regard to which, despite speculation, his intentions were unknown. Teena lavished presents on his girlfriends, which were funded through multiple counts of thefts and forgery that brought him to the attention of law enforcement. Thus, his gender history was increasingly becoming known, thereby frequently exposing him to transphobic verbal violence until this lifestyle became unsustainable. At age 21, Teena left Lincoln, Nebraska, for Falls City, Nebraska, in mid-November 1993.

In Falls City, Teena began a new life dating local girls, such as Lana Tisdel, whose friends included John Lotter and Tom Nissen. Lotter and Nissen both had criminal histories, and the latter was suspected as belonging to a white supremacist organization called The White American Group for White America. They befriended Teena and integrated him into their community. His girlfriends frequently described him as the "perfect boyfriend" but that he could be controlling and possessive. His gender identity disclosures varied; he told Lana he was intersex, then said that he had lied and instead identified as a trans male. Teena resumed his fraudulent criminal activities to fund his lifestyle and was subsequently charged as a female and taken into custody. Lana posted his bail. The local police, however, outed Teena by releasing his trans identity to the local newspaper. This disclosure contributed to the fatal chain of events that may have been perpetrated as punishment for his disruption of the naturalized gender binary.

The discovery of Teena's trans identity led to John Lotter and Tom Nissen forcibly exposing his genitalia in order to verify his sex and simultaneously demean Teena and unequivocally out him to his girlfriend Lana Tisdel. Lotter and Nissen, confused, humiliated, and angry at the perceived "gender deception," kidnapped Teena on Christmas Eve. They then drove him to the countryside, where he was beaten and raped. This use of sexual violence was an apparent attempt to reinforce his gender identity. They also threatened to kill him if he reported the incident to the police, which he did. However, his case was not taken seriously despite physical confirmatory evidence. Sexism and institutional transphobia were evident in the

insensitive police response whereby Teena was objectified, dehumanized, and misgendered when questioned by Sheriff Charles Laux and Deputy Sheriff Jon Larsen. This secondary victimization may have exacerbated his trauma. Police questioned Nissen and Lotter 4 days later; they denied all charges and were released. The police also failed to take Teena's family's concerns seriously about his fearing for his life and hence his move to Humboldt, Nebraska. Deputy Sheriff Tom Olberding seemingly had grounds to arrest Nissen and Lotter on December 28. Nevertheless, Sheriff Laux's orders were to wait until December 31. This was too late for Teena, who was shot and stabbed by Nissen and Lotter earlier on New Year's Eve. They also shot Lisa Lambert and Philip DeVine (boyfriend of Leslie Tisdel, Teena's ex-girlfriend's sister). Lambert and Devine may have been killed for being witnesses or for their sexual and racial "deviancies"—Lambert's alleged sexual relationship with Teena and Devine, a Black man engaged in an interracial relationship. C. Riley Snorton speculates that the murders of Teena, Lambert, and Devine were to silence and punish them for transgressing heteronormative gender and sexual boundaries and engagement in interracial relationships. As of 2020, Nissen is currently serving terms for one first-degree and two second-degree murder counts at Lincoln Correctional Center; his appeals were rejected by the Supreme Court. Lotter is on death row at the Nebraska State Penitentiary; his appeals were also rejected by the Supreme Court in 2018. A wrongful death suit for $1 million in damages was filed by Teena's mother against former sheriff Laux and Richardson County, which was initially rejected by the district court judge. Subsequently, the Supreme Court overturned this judgment yet awarded only $98,223.20.

Teena's case emphasizes the evident institutional transphobia of the criminal justice system, which failed him because of his criminal history, trans identity, and the misogyny of local law enforcement, denying him legitimate victimhood and professional support. These factors also negatively affected the investigation of his rape and murder. In the widespread documentation of Teena's life, his choice of settling in a rural, isolated, conservative town suggests that not all queer or trans people seek out the obscurity of urban life, despite the likelihood of more freedom, anonymity, and the potential support of an LGBTQIA+ community in a city. Brandon Teena's death highlights the importance of raising social awareness and education to break down barriers, reject myths and misconceptions, and stimulate a positive change in attitudes to trans people.

TERFs

Popularized in 2008 by an online cisgender feminist community, TERF is an acronym for *trans-exclusionary radical feminist*. The community used the term to refer to the sex essentialist feminists who were flooding into their discussion space. TERFs asserted that "sex" was reducible to specific body attributes or to early socialization and therefore saw trans women as men and sought to remove them from "women's spaces" and the lesbian feminist movement. The term has been rhetorically helpful in distinguishing TERF activism from the long-term radical feminist community members who are inclusive of trans women and in recognizing that early radical feminist opinion leaders like Andrea Dworkin, Catharine MacKinnon, and Dana Densmore and pioneering radical feminist groups like the *Lesbian Tide,* the Olivia Collective, and Sisters were trans supportive.

However, TERF activists characterize the acronym as offensive, which spawned the "TERF is a slur" campaign to discourage its use. Many TERFs see no distinction between their politics and radical feminist analysis, but if such a distinction is to be made, they encourage opinion leaders to use the term *gender critical* instead of *TERF*.

Therefore, the rhetorical utility of *TERF* brings a not always welcomed linguistic nuance to feminist discourse, especially online discourse, wherein communication is frequently condensed through abbreviations, symbols, and acronyms. While *TERF*, as a lexical unit, can carry unflattering overtones in the same way that *bigot, misogynist,* or *racist* might, it nonetheless constructs a much-needed way to disentangle the sometimes subjugative, violent, and even murderous anti-trans behavior and rhetoric of TERF activism from radical feminism itself, even as TERFs work tirelessly to represent their activism as "radical feminism" on popular, social, and academic media platforms.

TERF Activism

The following is a timeline of TERF activism that proved structurally or culturally significant.

1973	**Daughters of Bilitis:** TERF activists organized to expel Beth Elliott, an out trans woman, from the organization.
	West Coast Lesbian Conference (WCLC) Disruption: A group of TERF activists calling themselves the Gutter Dykes physically attacked radical feminist cis performers Robin Tyler and Patty Harrison for attempting to protect WCLC co-organizer Beth Elliott from their attempted bashing. The disruption continued until Elliott fled the event. This attack represented the first time that anti-trans activism reached a national audience.
	TERF Activists Target Trans Rights Pioneer Sylvia Rivera: Angered that Rivera used "she/her" pronouns and the women's bathroom, TERF activists attempted to stop Rivera from speaking at the Christopher Street Liberation Day Parade. According to Rivera, TERF activists beat her for attempting to speak, precipitating her withdraw from direct activism.
1977	**The Olivia Collective:** TERF activists had long been opposed to Sandy Stone, an out trans woman, being a member of the Olivia Collective, an all-women group that produced records and concerts. A TERF organization named The Gorgons issued a death threat against Stone should she appear at an Olivia music event that she was co-organizing in Seattle. The Gorgons did come with guns to the event but were disarmed by the security personnel hired by Olivia. As threats against Olivia escalated, Stone left the group. In 1987, Stone wrote a document foundational to trans feminism, "The Empire Strikes Back: A Posttranssexual Manifesto."
1979	**The Transsexual Empire:** Janice Raymond published what has become the manual for TERF advocacy, the book *The Transsexual Empire: The Making of the She-Male*.
1980–2013	**Janice Raymond and Health Insurance Coverage:** In 1980, the congressionally mandated National Center for Health Care Technology (NCHCT) contracted Raymond to research the ethical nature of trans health care. Citing Raymond's work to support its findings, the NCHCT issued a 1981 report recommending that health care related to "sex changes" not be covered by public health care insurance. Based on the NCHCT report, a National Coverage Determination (NCD) excluding trans care from public health care insurance was issued in 1989 in the *Federal Register,* and private health care insurers began citing the NCD

(Continued)

(Continued)

	in their exclusion of trans care. In 2012, a State of California study found that one of the most reliable predictors of suicide among trans women and men was not being able to access transition-related medical services. In 2013, the U.S. Department of Health and Human Services found that the 1981 rationale for excluding trans health care from public health care insurance programs was "no longer reasonable," and citing this finding, numerous public and private health care insurance policies lifted their bans against trans health care. TERF activists continue to advocate against trans medical care.
1991–2015	**Michigan Womyn's Music Festival (MWMF):** In 1991, Nancy Burkholder was ejected from MWMF for being trans, and the incident became a cultural touchstone for the issue of transphobia within queer and feminist communities. In both 1992 and 1993, cis lesbian feminist Janis Walworth organized an outreach and education effort to support trans inclusion at MWMF. In 1993, MWMF security informed Walworth that her outreach group was in physical danger and that their safety could not be guaranteed. Even though some MWMF "leather dykes" volunteered to provide the group with security, they decided to move outside the gates of the festival, establishing what became known as "Camp Trans." Outreach and education attempts continued until 2015, when MWMF ceased operations without officially lifting its ban on trans women.
1995–2019	**Vancouver Rape Relief & Women's Shelter:** Since 1995, the Shelter has fought to remain a cis-only space, and in 2007, the Canadian Supreme Court set a legal precedent by refusing to hear an appeal of a trans woman who had been denied entry into the group's volunteer counselor training program. In 2019, the shelter lost funding from the Vancouver City Council due to its commitment to anti-trans discrimination.

"TERF Is a Slur"

Following a 2012 right-wing "homophobe is a slur" campaign, TERF activists began organizing "TERF is a slur" and "cis is a slur" campaigns. TERF activists asserted that these terms were offensive and used to disparage (cisgender) women. While the "cis is a slur" campaign largely fell into obscurity after *cisgender* was added to numerous dictionaries, organizing around the "TERF is a slur" campaign continues.

Some activists and academics do not use *TERF*, as they wish to avoid the possibility of a controversy that would detract from their arguments. For example, The Conversations Project, a trans and radical feminist historical project, tends to use *sex essentialist activist* instead, as they are concerned that *TERF* would be perceived as "unsisterly." Other radical feminists reject the term because they do not believe that TERFs are truly "radical" or "feminist." Moreover, *TERF* is critiqued because its use is sometimes expanded, especially on social media sites, to refer to those who promote a TERF-style sex essentialist discourse, even if the anti-trans activist may not self-identify as being any type of feminist.

However, these critiques are applied to any descriptive term that carries a level of social repudiation, such as *homophobe*, *racist*, or *misogynist*. For instance, in 2012, Kari Simpson, a right-wing activist, filed a human rights complaint in Canada because some schools used the term *homophobic* to describe anti-gay hate. Simpson claimed that homophobe was a "made-up" slur and that it was used to "deliberately mock Christians." These terms are rarely accepted by those they describe and yet can be necessary, as they offer a means to name specific types of bias-based beliefs, rhetoric, behavior, and the resulting structural oppression, particularly for those who suffer the effects of this bias. At the same time, some sex essentialist activists, even a number of TERF opinion leaders, do, at times, identify with the term *TERF*.

"Gender Critical, Not Anti-Transgender"

In 2013, as *TERF* began to gain cultural currency on social media platforms such as Twitter, attorney and TERF opinion leader Elizabeth Hungerford began promoting *gender critical* as a feminist identity. Whereas *gender critical* had previously referenced a trans-inclusive, queer feminist critical analysis of the sexist aspects of gender, such as gender stereotypes, gender roles, and gender hierarchies, Hungerford promoted the term as a euphemism for beliefs, rhetoric, and behavior that were critical of trans people.

Hungerford's promotion of *gender critical* came in the form of an open letter to the hundreds of feminist opinion leaders and organizations who signed a letter opposing what the signatories referred to as "transphobic feminism" in academia and the wider society. Hungerford's rhetorical work was aimed at languaging a sex essentialist anti-trans ideology as feminism, radical feminism, and the critical analysis of gender itself. Since Hungerford's 2013 announcement, *gender critical* and *radical feminist* are the primary self-identities used by TERFs when publicly discussing the equality of trans people. For instance, the largest TERF recruitment site, with tens of thousands of members, is a Reddit forum named "Gender Critical" that describes itself as "a radical feminist subreddit."

Utility of *TERF*

The linguistic and cultural utility of *TERF* becomes apparent when one considers the reality that practically every contemporary anti-trans sex essentialist argument was originally asserted in Janice Raymond's 1979 TERF classic, *The Transsexual Empire*. A self-identified "radical feminist," Raymond pioneered the anti-trans rhetoric that has been employed by the likes of the Heritage Foundation, Tea Party politicians, and pundits; alt-right activists; and anti-LGBTQ+ hate groups like the Alliance Defending Freedom. Her goal, as she unambiguously stated in her work, was "morally mandating [transsexualism] out of existence" (p. 178). It is this shared vision of morality that discursively binds TERFs to the ideological right.

Since both the radical feminist and gender critical traditions have a history of strong trans support and advocacy, the use of *TERF*, especially within the context of social media, serves as an important rhetorical intervention against the effort by anti-trans sex essentialist activists to colonize "radical feminist" and "gender critical" identities. While the term *TERF* is critiqued as being antagonistic, it nonetheless fills a discursive void in that it concisely assigns a lexical identity to a set of ideas pioneered by the TERF movement, regardless of who makes use of these arguments. In this way, *TERF* can be used both to identify a specific morality-driven rhetorical tradition and to distinguish it from trans-inclusive traditions and movements.

Therapist Training

Although many psychology graduate programs offer a course devoted to working with the LGBTQIA+ population as an elective, it is rare to find a course specific to working with the trans population, let alone one that is required of all students. Gender dysphoria is typically briefly covered in courses on psychopathology and mental health, and gender identity development is often reviewed in developmental psychology courses, yet further training is required to truly understand the complexities related to the care of those who grapple with gender dysphoria. Many therapists feel unprepared to meet the unique needs of their trans clients, creating an additional barrier to accessing care for this population. The in-depth training that is needed for therapists to gain competency and confidence to work effectively with the trans population is typically left for the therapist to seek out independently. This entry addresses the main components of training, whether it be in graduate school or postgraduate training, for therapists to provide ethical and quality care to this population.

Trans-Affirmative Therapy

First and foremost, any training of therapists should emphasize using a trans-affirming therapeutic stance, which is defined by the therapist affirming the client's gender identity and not trying to change or repair it—the latter of which is the focus of reparative therapy (i.e., the goal is change the client's gender identity to match their sex assigned at birth). Importantly, all of the major professional psychological and therapeutic associations have condemned reparative therapy for the treatment of gender dysphoria and have published written statements supporting the use of the trans-affirmative model.

Gender and Gender Dysphoria

Those without exposure to the LGBTQIA+ population may be confused about the differences among sex assigned at birth, gender identity, gender expression, and sexuality. When considering these concepts, it is of utmost importance for the therapist in training to also understand the nuances and complexities that exist between the binaries of male/female, man/woman, masculine/feminine, and attracted to men/attracted to women. Examples of these nuances may be intersex, nonbinary, androgynous bisexual, and pansexual. While therapists need to gain understanding of the American Psychiatric Association's *Diagnostic and Statistical Manual* (*DSM*) and the World Health Organization's *International Classification of Diseases* (*ICD*) definition of gender dysphoria, it is also important for therapists to realize that the feeling of gender dysphoria is experienced differently by different transgender people, and some may not experience it at all.

Bias, Stigma, and Intersecting Identities

Awareness of the diverse minority stressors and intersecting identities possessed by their trans clients will aid the therapist in supporting those clients. Cisgender (cis) therapists need to be aware of the different biases and privileges that they hold and how their identities have the potential to affect the therapeutic relationship. It is important for all therapists to be cognizant of the fact that the process of identity development and expression is different for each trans person. And of course, trans clients seek therapy for a variety of different reasons, not all of which are related to their gender identity.

The Gatekeeper Dynamic

Therapist training should highlight the history of gender identity in the field of psychology. It was only as recently as 2012 that the diagnosis of Gender Identity Disorder was changed to Gender Dysphoria in the *DSM-5*. For decades, therapists have been forced into the role of evaluator/gatekeeper, beholden to following different guidelines to author documentation for clients to gain access to their desired medical interventions. While these guidelines have changed throughout the years, and some medical establishments now follow the informed consent model, the dynamic has already been established where many trans individuals distrust therapists and feel they have to portray a certain narrative of themselves in the therapy session.

Children and Adolescents

When working with children and adolescents, it important for therapists-in-training to have an understanding of child and adolescent development and family systems. Not all children who identify as trans will continue asserting that identity as adults, just as not all cis children who come to understand their identity as a child will grow up to be cis. Similarly, among adolescents who assert a trans identity, some may have shown evidence of cross-gender expression and interests as a child, and others may not have. Although members of a family system can benefit from support if and when a family member comes out at any age, family therapy and/or support groups for parents can be extremely beneficial when that member is a child or teen.

Vulnerabilities

A good therapy training program must stress the vulnerabilities of the trans population. Because of discrimination, stigma, and lack of understanding and acceptance in families and society at large, this population is at high risk for suicide, hate crimes, substance abuse, depression, anxiety, and other negative outcomes. From a clinical perspective, for individuals who have known of their identity for most of their lives but have not been seen as their true selves, developmental trauma may have occurred. The therapist's office becomes a safe container for the client's identity to be reflected and validated. Just using the client's chosen name and pronouns while reflecting their identities in session can be profoundly healing for some clients.

Social Transitions and Accessing Care for Medical Interventions

Therapists should be trained to understand that some but not all trans clients will seek both social and medical intervention to alleviate gender dysphoria. The World Professional Association for Transgender Health (WPATH) Standards of Care are a set of guidelines for therapists and other medical professionals to use in assisting their clients through this process. The WPATH Standards of Care act as a guide for aiding clients with social transition, hormone blockers, hormones, and surgical interventions. Therapists should have an understanding of how to support clients before, during, and after social and medical transitions.

Conclusion

While this entry highlights the necessary primary components of a therapist training program for working with trans clients, it is important to note that this is an ever-growing and changing population. There is a need to integrate these core components of training into academic therapy programs, while also expanding on this information and offering specialized postgraduate training in continuing education. These professional development opportunities should be available in real life and virtually (i.e., online), conducted by seasoned professionals specializing in the trans population as well as professional organizations committed to serving gender-diverse populations. Furthermore, investing in ongoing support and consultation/supervision is a desirable addition to a therapist's professional development regarding the trans population.

Therapy/Therapist Bias

Therapists are called to provide affirming and culturally competent care for trans clients; however, various biases about gender diversity and trans identities can interfere with the delivery of truly affirming mental health care for trans people. Cisnormativity, or the false assumption that all people have gender identities that match their sex assigned at birth, can lead to several biases and barriers to the mental health care that trans people receive. Anti-trans prejudice also affects the negative attitudes, beliefs, and stereotypes that people may have about trans and gender-diverse people. Given such misconceptions about gender, therapists may also hold various biases about gendered roles, gendered expressions, and gendered identities of trans and gender-diverse people. Furthermore, many therapists report lacking *knowledge* of trans communities, *awareness* of their own gendered biases, and the *skills* needed to provide affirming mental health care for trans clients. Such deficiencies in knowledge, awareness, and skills leave many therapists unprepared to provide culturally competent care for trans clients, who experience a variety of barriers to accessing quality mental health care. This entry provides an overview of trans people's general experiences of therapy, therapists' misconceptions and biases, harmful conversion therapy practices, and ways to increase therapists' cultural competency to support the delivery of trans-affirming mental health care.

Experiences of Mental Health and Therapy

Trans people interact with therapists for various gender-related and gender-unrelated concerns. Trans people also face disproportionately high levels of mental health concerns and distress, which may be due, at least in part, to the minority stress that marginalized communities face. Minority stress theory explains that both external distal stressors (i.e., discrimination, victimization, harassment) and the proximal internal stressors that may follow (i.e., vigilance, fear of rejection, self-stigma) can help explain the higher rates of depression, anxiety, suicidal ideation, and distress among trans individuals. Furthermore, for trans people seeking gender-affirming surgeries, the need for a letter of support from specific medical professionals can increase the likelihood that trans people will seek out a therapist. Given their higher rates of distress and the need for a letter of support for gender-affirming surgeries, trans people tend to seek therapy at higher rates than the general population. Unfortunately, trans people also report various barriers to accessing mental health care, and when they are able to access care, trans people's experiences of therapy are often fraught with therapist biases and microaggressions. Even for well-meaning therapists, several stereotypes and biases can impede the delivery of trans-affirming mental health care.

Cisnormativity and Therapist Biases

Therapy with trans people should be affirming; however, therapists may possess biases that interfere with the delivery of culturally competent and affirming care. Even when therapists are trying to be affirming of clients' gender identities, cisnormativity—the belief that cisgender identities are the only normal and acceptable identities—often influences how therapists understand trans and gender-diverse people. These biases may be seen via therapists' beliefs in a gender binary, expectation that trans people have a linear transition, and gatekeeping around trans people's access to affirming medical care. Additionally, therapists' missteps can entail a reliance and burden on trans clients to educate their therapists about their trans identity and trans communities. Sometimes therapists will also either try to avoid conversations about gender identity or focus too much on gender at the expense of other areas of the client's life. Therapists also misstep when they assume that the experiences of trans clients are all the same and fail to consider the intersections of clients' various cultural identities. Such stereotypes, biases, and assumptions about how to work with trans people can lead to ineffective therapeutic interventions that can cause more harm than good for trans people. Therapist biases affect the therapeutic relationship, mental health outcomes of trans people, and trans people's willingness to seek therapy.

Binary Beliefs About Gender

Therapists may hold either explicit or implicit beliefs and misconceptions that gender is binary and there are only two gender categories, boys/men and girls/women. These biases can be particularly problematic for trans people who do not fit into this binary, including genderqueer, agender, bigender, and nonbinary identified people. Therapists who struggle to conceptualize gender outside of this binary may fall into common biases of assuming that (a) there are only two genders, (b) gender identity matches gender expressions, (c) binary and nonbinary trans people are always interested in medically transitioning across the binary, (d) nonbinary identities are not valid or real, (e) being nonbinary is a new fad, (f) gender identity is constant and stable over time, or (g) that all trans people have a goal of "passing." These misconceptions and biases can be harmful and invalidating, and they can lead to inappropriate treatment options for trans people who do not fit into this binary mold.

Assumptions of Linear Transitions

Some trans people may seek gender-affirming social, medical, and legal steps to transition from their sex assigned at birth to some other gender identity; however, not all trans people choose to transition in the same ways. Yet, many therapists may have outdated assumptions that there is a singular, normative, and linear transition path that trans people should follow, which often follows a binary transition path. Belief in this prescriptive and linear transition path often includes the notion that there are specific steps that trans people should follow. Therapists who do believe in a linear transition path with specific steps and stages may encourage their trans clients to move through various transition processes in a stepwise fashion that may not be accurate or indicated for that client. Instead, the transition process should be individualized, and therapists should follow their client's lead regarding their own unique transition journey.

Therapists as Gatekeepers

Trans people are often put in the position of having to be assessed by therapists and get a letter of support to access gender-affirming medical care, specifically surgeries. This process has been criticized for placing therapists in the role of being a gatekeeper for gender-affirming care. For trans people, having to get a letter from a therapist can create a barrier to care and can also cause a harmful dynamic between the therapist and the client such that clients many feel the need to prove they are trans enough to be granted access to gender-affirming medical care. Some research suggests that having to get a letter from a therapist to access gender-affirming care can negatively affect the therapeutic alliance, reduce benefits of therapy, add to oppressive experiences, and create barriers to transition. However, given the World Professional Association for Transgender Health (WPATH) Standards of Care Version 7 guidelines for these letters, therapists are in a position to choose how to conduct such assessments so as to minimize biases and decrease the potential for harm. As critics have noted, binary and nonbinary trans people should not be made to "prove" themselves as trans enough or pushed into a binary or linear transition path to access medically necessary treatments. Rather than being gatekeepers, scholars and activists suggest that therapists can learn to be liberators who work collaboratively with clients and support their trans clients' rights to self-determination.

Harmful Gender-Reparative Therapy Approaches

Some of the most harmful biases include assumptions that trans identities and gender-diverse experiences are pathological and need to be changed and that trans people need to be "fixed." These discriminatory practices and harmful interventions include gender-reparative or conversion therapies—misguided, problematic, and detrimental attempts to change a person's gender identity to match their sex assigned at birth. These gender-reparative therapies can include harmful efforts to coercively stop trans people from identifying as a gender that does not match their sex assigned at birth. These approaches can include encouraging trans clients to dress, act, and identify with the gender they were assigned at birth and actively discouraging gender-diverse expressions. This may include having clients behave, dress, and

speak in stereotypically masculine or feminine ways that match their sex assigned at birth instead of their stated gender identity. Research shows that these overt biases against trans people and gender-reparative approaches are harmful to trans and gender-diverse people, often increasing psychological distress and suicidal ideation. Gender-reparative therapy and conversation therapy approaches that attempt to change a person's gender identity to match their sex assigned at birth are now widely recognized as ineffective and destructive, and they reflect cissexist and transphobic biases.

Increasing Therapists' Cultural Humility and Trans-Affirming Care

Gender is complex, multidimensional, and ever expansive beyond binary categories of men and women. In order to provide affirming mental health care for trans people, therapists need to increase their cultural competency and humility by reflecting on their own gender attitudes and biases, developing knowledge about gender diversity and trans communities, and gaining the skills to provide affirming care for trans people across the gender spectrum. Importantly, therapists are also called to advocate for and with their trans clients who face challenges obtaining gender-affirming care, correct legal documents, or protections against discrimination. Therapists are increasingly being called upon to advocate, from a public policy and legal perspective, for the creation of systemic social changes that challenge the inequity and discrimination that trans people face. Liberation psychology provides a framework for creating such social change by examining the effects of power, oppression, and the intersections of multiple social identities on the experiences of both trans and cisgender people. Whether providing affirming or liberating psychological services for trans people, therapists are strongly encouraged to interrogate their own notions of gender and explore the explicit and implicit biases they hold about the diversity of trans identities and experiences. As discussed earlier in this entry, several intentional and unintentional missteps and biases can negatively affect the care trans people receive. However, by doing the work of learning, advocating with, and questioning biases about gender, therapists can help create affirming therapeutic experiences for trans clients across the gender spectrum.

Third and Fourth Gender Roles

Around the world and throughout history, third and fourth gender roles are occupied by people who do not fit easily into the category of cisgender man or woman and include trans persons in some contexts. Third gender roles, indicating a gender category neither cis man nor cis woman, are more commonly recognized than fourth gender roles. The fourth gender role is used to indicate gender identities in societies that recognize more than three genders. The idea of third and fourth gender roles can indicate not only how individuals or groups see themselves but also how they are perceived and the gendered place they occupy in their wider society. The idea of third and fourth gender roles can be used to refer to behavior and social roles as well as biological traits or identity depending on context. Importantly, the idea of third and fourth gender roles can be criticized for masking complex differences between different gender identities in different contexts as well as intersectional perspectives whereby class, race, age, sexuality, culture, and nationality shape gendered experience. However, third and fourth gender roles and categories are significant in contesting the simplicity of the binary gender order of cisgender men/masculine and cisgender women/feminine and in offering a framework that can be used by activists and others to claim nonbinary and queer space, identities, and ways of being. The following paragraphs highlight different examples of third and fourth gender roles in different societies, legal frameworks, and contexts.

Third and fourth gender roles are used in very context-specific ways. At different points in different societies, the third gender category has referred to gay men, trans persons, persons who are nonbinary or intersex, and cis women who occupy spaces or roles perceived as traditionally masculine. The two-spirit people in Indigenous North American society occupy a nonbinary, third gender role. Randolph Trumbach describes how gay men in early 18th-century England were understood as a third gender because they fell outside the expected parameters of masculine desire. The *muxes* in the Oaxaca region of Mexico are assigned male persons who often use dress or makeup to perform ideas of femaleness and do not generally identify as either female or male. The *fa'afafine,* an intermediate gender category in Polynesian culture, refers primarily to male-assigned persons who live in gender-liminal (in-between) ways. The term *xanith* in Oman has been used to refer to gay men who behave in so-called effeminate ways and are understood to be socially similar to women. Less commonly linked to the term *third gender* but sometimes framed as such are the *bacha posh* in Afghanistan, female children brought up as male, particularly where there is no male child within a family. These children fulfill the social function of a son for a time but can usually be expected to return to a female role in adolescence. Those occupying fourth gender roles have included lesbian women, as noted by Trumbach in his discussion of early 18th-century England, and trans persons. As discussed in the work of Sharyn Davies, the Bugis, a large ethnic group in South Sulawesi, Indonesia, have a nuanced and complex understanding of gender, recognizing four genders of *makkunrai* ("female women"), *oroani* ("male men"), *calalai* ("female men"), *calabai* ("male women"), and a meta-gender group, the *bissu* ("transgender priests"). So, while the third gender role has often been occupied by those who do not easily fit cisgender binaries, fourth gender roles are a further categorization to recognize different identities in more detail.

Persons who occupy third and fourth gender roles have often been understood as spiritually powerful, leading them to take a significant part in cultural ceremonies and rituals and to be treated with respect and reverence. At the same time, historically, third and fourth gender roles have been marginalized, even criminalized, by European colonial powers and settler colonial societies. One example of this is the treatment of the *hijras,* a third gender role in India. Under British colonial rule shaped by racialized ideas, hijras were treated as criminals and as threatening to the social order. This demonstrates the intersections of race and sexuality that have produced and policed ideas about third and fourth gender roles and compounded forms of discrimination and stigma around them in some contexts.

Today, the category of the third gender has been recognized in legal frameworks all over the world (including in Argentina, Denmark, the

Netherlands, New Zealand, Nepal, Australia, India, Iceland, Malta, Germany, and Pakistan). In Nepal, for instance, citizens can self-identify as third gender on their passports, in voter registration, and in the census. This is a vital political and rights-based victory brought about by sustained activism. Malta has particularly comprehensive intersex and trans-inclusive measures in place for its citizens. However, some uses of the third gender as a legal category can be restrictive, for instance, in Germany, where the selection of or change to a third gender option on legal documents requires medical certification to demonstrate intersex status. This restricts the category to biological or medical understandings, excluding other modes of identification that fall outside a binary gender construction.

In practical terms, although additional forms of legal and cultural recognition in certain countries and practices are important, the rights and safety of those who occupy the third and fourth gender role are precarious globally. Being LGBTQI+ is criminalized in multiple countries around the world, and those who occupy third and fourth gender roles can experience heightened social marginalization and numerous psychological, economic, and cultural pressures and stigmas linked to their gender role and identity.

Tipton, Billy

Billy Tipton (1914–1989) was a jazz and swing musician and entertainer who played piano and saxophone and sang in bands and trios throughout the Midwest and Pacific Northwest from the mid-1930s through the mid-1970s. Born Dorothy Tipton in Oklahoma City, Billy began living as a man at the age of 19. He died in Spokane, Washington, at the age of 74. He did not identify as a trans person. At his death, the revelation of his anatomy by paramedics stunned his adopted sons and everyone who knew him, including four of his five ex-wives, and set off very public debates about sex and gender that resonated throughout the then coalescing trans men's community.

The coroner, who had signed the autopsy report prepared by a pathologist certifying "that the body was that of a normal biological female past menopause," called a local journalist with a tip to check out Billy Tipton's death certificate. Since Billy had been a well-known figure in the entertainment industry, the journalist believed Billy's anatomy was something the public had a right to know about. The news traveled quickly. Billy's sons and his last ex-wife, Kitty, were besieged with requests for interviews, talk-show appearances, and film and TV offers to tell Billy's story. Kitty solicited Diane Middlebrook, a respected biographer who had grown up in Spokane, to consider the challenge of researching and documenting her ex-husband's remarkable life.

For trans people, Billy Tipton symbolized numerous problems, not the least of which were shame and confidentiality, and people who had been "cross-living" for many years without the benefit of gender-affirming surgery and its hoped-for promise of legal recognition as men called surgeons' offices to ask if they were then too old to undergo the procedure. Furthermore, many of the public discussions about the "masquerade," the "deception" that Billy's life suddenly represented, relied on sexist, homophobic, and transphobic premises that were painful to listen to, let alone refute. Jason Cromwell, trans community leader, anthropologist, and author of *Transmen and FTMs* (1999), referred to these talking points as "default assumptions." These are assumptions that are accepted as fact because they seem obvious—for example, the assumption that a

woman puts on men's clothing only because she wants to take something that belongs to men, as if the only reason a woman would wear a man's work shirt, coveralls, and steel-toed leather work boots would be to take a job that only a man would perform. In this line of reasoning, because Billy loved women, he had to pretend to be a man, and because Billy wanted to be a musician, he had to pretend to be a man, as if women were not able to be musicians or women could not love other women, both of which situations were not true.

Billy Tipton went to elaborate lengths to ensure that he was perceived as male and that no one would know that he was assigned female at birth. His wives never saw him without clothing. As a traveling musician, he was well aware of gay and lesbian venues and artists, as well as straight women who were singers and band members, and apparently he never made an effort to connect with gay or lesbian people as if he were "part of the family," nor did he ever try to form friendships with female musicians as if he were tempted to consider himself "one of the girls." Men who traveled with him and played in his trios were convinced of his maleness. He avoided doctors, and as he aged, he had to give up playing instruments because of arthritis in his hands, but he continued to work in the music industry, booking and mentoring young performers.

Although trans men worried about how the mainstream press reacted to Billy's "deception" and how that reflected on their own needs to live as men, they also admired Billy's determination and his self-confidence. Hormones and surgery were available during Billy's lifetime, and he could have, if he had wanted to, saved the money to obtain these treatments and banish the fear of exposure from his consciousness, but he never did. Toward the end of his life, he took some small steps to ensure that no one would find any binding garments or genital prostheses that he had used routinely for his entire adult life. The conflict between the body and the gendered self with which some trans people struggle was apparently not worth fighting any longer, and he may not have wanted those he left behind to be burdened with his evidence. The only evidence he left was everyone's certainty regarding his maleness. He knew who he was and what he was capable of, and he lived his life authentically. To say that he was "really a woman" simply because he was assigned female at birth would be to deny the truth about him. And all those who might claim that biology is destiny and use his anatomy to diminish him, all of his accomplishments, and all of the perceptions that others who knew him had about their relationships with him would also be denigrating women in the process. As Middlebrook notes, the truth was he was Billy Tipton, and he did all that he did and was everything he was, and his life is a testament to the power of the human spirit to express the truth of its own capabilities and feelings regardless of the form of a body.

Tom

In the late 20th century, a number of societies in Southeast and East Asia adopted the English-language word *tomboy* as a name for masculine women, transmasculine people, and trans men. In Thailand, this became *tom* and has been used both by tom themselves and Thai society generally. Tom adopt various masculine-associated personal styles, demeanors, and manners of speech. Traditionally, tom romantically partner with feminine women, called *dee* (from the English word *lady*), but tom modes of masculinity, sexual expression, and social networks have transformed beyond Thai conventions of binary gender and sexuality.

Relative Acceptance

Tom experience less public oppression in Thai society than do masculine females and trans men in much of the world, and their gender identities

and sexual relationships are not criminalized. Since the 1980s, tom have been visible in Thai popular culture, particularly in pop music, where tom singers have developed an enthusiastic fan base. The first movie with a tom lead was the highly popular 2010 romantic comedy *Yes or No*. Thai tom are also social media celebrities, with followers across Asia. Apart from these elite examples, tom can be found in most spheres of Thai society, including working in stores and as bouncers in the sex trade.

Tom gender presentation reflects different Thai models of masculinity, often in step with international influences and consumer culture. Bangkok has shops catering to the tom market, and since the 2000s, binders have been available from Thai vendors and Asian mail-order businesses. Central Thailand has abundant plastic surgery clinics, and some tom with means opt for top surgery. There is also a slick, widely sold tom lifestyle magazine, *@tom*, pitched to middle- and upper-class readers. With the rise of the K-pop phenomenon, a subset of tom dress (and dance) like male K-pop stars, which is considered a more androgynous style.

Despite their relative acceptance compared with most other societies, tom's social location is more complex than their casual public presence suggests. Linguistically, while everyday spoken Thai commonly uses gender-neutral pronouns and allows a great deal of queer verbal play in formal and official situations, Thai requires speakers to use a male or female particle and often gendered first, second, and third pronouns, which render tom feminine. Thai authorities in the 20th century adopted Western psychological categories that labeled tom as sexual deviants. Even as this pathologizing view has eroded, tom still face constraint and harassment in their communities, including, in some cases, pressure to adopt feminine styles and marry a man. Schools, government jobs, and many businesses have had gendered dress codes based on legal sex. Because of these sartorial restrictions, tom often gravitate toward jobs that do not require skirts and pantyhose, such as working in small businesses. Tom cannot be ordained as monks, a highly respected role in Thai Buddhism.

Thai Gender Systems

Historically, the Thai sex/gender system recognized three categories: male, female, and *kathoey*—a Thai label for trans women or "lady boys." Until the late 20th century, non-LGBTQ+ people, especially older people, described tom as kathoey. But the term *tom* has since entered the Thai lexicon as its own identity.

The tom identity is rooted in a masculine gender, which in the Thai schema is intertwined with sexuality. Thai convention ascribes to masculinity an active sexual role that is oriented to feminine women. In the 21st century, new generations of tom introduced more diverse expressions of sexuality. An example is the category of *tom gay*—tom who have relationships with other tom. The erotic nature of tom's celebrity fandom has also become more explicit.

The recognition and self-concepts of tom are informed by the social context of Thailand. Some of the tolerance of tom is predicated on gender norms. For example, the prevailing cultural view is that sex requires the presence of a penis, so what transpires between two people considered female is treated as play rather than sex. The economic context is important as well. Thailand's lack of a robust welfare system, such as social security benefits, means that economically supporting parents is critically important. As a result, tom's gender nonconformity and same-sex relations can be accepted by many families, as long as tom remain appropriate (i.e., earn an income, support their family, avoid drama and scandal). Therefore, kinship patterns, political economy, and cultural values, especially the cultural differentiation of sexes, have all shaped tom identity. Thai society still positions most tom as female, regardless of their self-identification, although many tom identify as women/female in some way.

Tom and LGBTQ+

LGBTQ+ organizers combine *tom-dee-les* (*les* as a shortened form of *lesbian*) together as a name for queer people assigned female at birth. Tom concerns have been represented chiefly by the leading organization for lesbians, Anjaree, and by the LGBTQ+ organization Bangkok Sky. Socially, tom do not frequent the urban spaces created by Thai gay men or trans women, even though they lack their own cultural places. The Internet has allowed the formation of online groups and discussions that are shaping tom-dee-les subcultures and

self-concepts, which are shared across the country and with Thai speakers elsewhere.

In the 21st century, when the category of "trans men" became available to Thais, some assigned-female individuals began to identify as trans men (using the English term) rather than tom. Testosterone is available as an over-the-counter medication, so trans men who lack gender-affirming medical care often self-medicate. Trans men have formed groups like the Transmen Alliance of Thailand (TMAT), which is the public face of trans men in the country. But because Thailand does not allow trans people to change their sex assigned at birth, trans men and tom remain legally female.

Tomboys (Philippines)

Tomboy (pronounced with two short o's in its Philippine pronunciation) is a local and diasporic/immigrant/migrant term that is currently used in the Philippines and the Filipinx diaspora. This entry's content comes largely from the global city of Manila and Central Luzon in the Philippines and mostly from a Tagalog perspective, which may also include diasporic Tagalog perspectives.

Tomboy Defined

Filipinx gender and sexual identities are not monolithic. There are approximately 175 different ethnolinguistic groups in the Philippines, and the diaspora currently includes approximately 10 million Filipinos. Tagalog is one of the primary languages spoken in Manila, and the national language of the Philippines—Filipino—is largely based on Tagalog. *Tomboy* broadly suggests or signals gender nonconformity, particularly for those who were identified as female, *babae,* and/or girl at birth in the Philippines or the diaspora. Tomboy signals "female masculinity" and also "trans masculinity and trans maleness." *Tomboy* as a term, an identity, a linguistic and cultural translation, and a figure is important in and to Trans Studies because Southeast Asia is well known for its significant sexual gender diversity and relative inclusiveness. The Philippines and the Filipinx diaspora are also both important sites of scholarship and activism for LGBTQIA+ and other sexual gender minorities. In other parts of Southeast Asia, similar terms, identities, and linguistic and cultural translations circulate, as well tomboy people and figures. This includes *tom* in Thailand and *tomboi* in Indonesia and Taiwan, among other locations. These variants of tomboy(s) suggest how, in Southeast Asia and transnationally, important cultural connections and flows exist across spaces and geographies.

Babae

Babae (females/girls/women in Tagalog) are traditionally taught to embody and practice conventional Filipina femininities. Key components of traditional embodiment of Filipina femininity include living strictly as heterosexual and thus sexually and romantically desiring *lalaki* (males/boys/men); identifying and acting like a babae (female/girl/woman) through bodily gestures, movements, and clothing choices; behaving modestly in pious and socially conservative ways (especially concerning sexuality and Catholicism); and prioritizing family and related heteronormative responsibilities and obligations (like being

obedient to one's parents and other elders and making personal sacrifices for the good of the family). This type of conventional Filipina femininity is personified in the character Maria Clara from Dr. José Rizal's famous late 19th-century groundbreaking novel, *Noli Me Tangere,* which is required reading in the Philippines.

Tomboys

Tomboys disobey the social imperatives and pressures to live as babae, and they resist conventional cisgender (cis) Filipina femininities for themselves. Instead, tomboys behave and live in male/masculine ways. Tomboys, for example, walk, talk, and behave as lalaki/boys/men or other tomboys. They wear clothing geared for traditional lalaki/boys/men. They may have lalaki-like/boyish/mannish/tomboyish physical mannerisms, are usually sexually and romantically attracted to cis girls and women, may work in traditionally male occupations, and usually choose not to participate in heteronormative reproduction and "motherhood."

While the term *tomboy* usually refers to a "boyish girl," one who is going through a childhood phase in English/European/U.S. American understandings, *tomboy* in the Philippine and Tagalog sense is usually not a short-lived childhood event but rather continues throughout one's adulthood. Considering linguistic and cultural translations is important because the Philippines has been colonized by several imperial powers: Spain, the United States, and Japan. Thus, Filipinx understandings of tomboy(s) include imperial/globalized influences, along with native or local elements.

Tomboy as Trans and Working Class

Contemporary queer and Trans Studies scholarship suggests that definitions of tomboys and tomboy-ness in Philippine and diasporic contexts need to be expanded, so that tomboys can also be understood as trans and, therefore, also as lalaki (male/boys/men). In other words, tomboys can be understood as individuals who were identified as babae at birth but who socially, emotionally, and/or physically transition to live as lalaki.

Class or economic position is also an important consideration when thinking about contemporary tomboys in the Philippines. The Philippines, overall, is a poor country with a poverty rate of 16.6%. The current average monthly salary for a local Filipinx is 48,800 Philippine pesos (or $993 per month). These particular economic circumstances may significantly affect whether or not a tomboy chooses to medically transition. It may be cost prohibitive to begin testosterone therapies or gender-affirming surgeries. In Philippine cinema and television, tomboys are often portrayed as working class and/or poor. Movie and television characters are often shown working in working-class men's service positions, such as bus conductor or security guard, or in jobs that do not require them to wear feminine uniforms.

Tomboys experience discrimination and gender policing at school and in many places of employment. For example, some tomboys may find it difficult to finish their educations because many schools in the Philippines require babae to wear feminine uniforms (e.g., skirt and blouse). Owing to institutionalized discrimination, homophobia, and transphobia, as well as the ways that the gender binary is managed and enforced in education and employment, tomboys may have difficulty finding jobs that pay higher wages, which contributes to tomboys remaining poor or working class.

Tomboy as Decolonial

With dominant medicalized definitions of transness (coming from the United States and elsewhere) reaching Philippine shores, local Philippine tomboys (who do not medically transition) are not widely seen or understood as male, lalaki, boys, trans, and/or trans men. This suggests that colonial, neocolonial, and/or global discourses in the Philippines may be affecting how tomboys are still viewed as "not trans." As such, tomboys also expose ongoing cultural tensions and differences in translations among and between different languages; different local, regional, and global identifications; and different gender ideologies, discourses, and practices. *Tomboy* as a term, identity and practice, therefore, also offers Filipinx and other Asians the possibility to decolonize and unsettle dominant notions of trans, and in doing so, the term, identity, and practice of *tomboy* potentially facilitate decolonizing Trans Studies as a field, as well as dominant trans activism.

Trans Men

Trans men are people who were designated female at birth but who identify and often live their lives as men. Their existence cuts across boundaries of nationality, race, ethnicity, religion, sexual orientation, ability, and socioeconomic class. Historical records from the late 19th and early 20th centuries indicate that men who had been assigned female lived exemplary male lives without their birth status being known until their deaths or some mishap. However, even if their sex assignment was discovered during their lives, most trans men continued living as men. When hormones and gender-affirming surgeries became available by the mid-20th century, many trans men who could afford these procedures changed their physical sex to align with their gendered selves. These men played a key role in changing medical professionals' understanding and treatment of trans people and laid the groundwork for trans male social activism in the 1980s and beyond. As with other marginalized communities, trans male organizing has been significantly aided by contemporary communication technologies and the rise of social media.

1870s–1930s

Prior to being able to access masculinizing hormones and gender-affirming surgery in the 1940s, trans men navigated their social and occupational environments through the guise of maleness. They wore traditionally men's clothing and hairstyles, worked in typically male occupations, and socialized in male-dominated spheres. Some trans men also served in the military, coupled with cis women, and were fathers to children, which enhanced their standing in their communities as men. Being seen and treated as male enabled white (and white-passing) trans men to access the rights of citizenship (e.g., voting, inheritance, property ownership, and living-wage jobs) that were largely denied to people of color, immigrants, and women. According to historian Emily Skidmore in *True Sex: The Lives of Trans Men at the Turn of the Twentieth Century,* most white trans men lived quiet, ordinary lives in rural areas and small towns, where they were known as hardworking, law-abiding, patriotic citizens and good neighbors. One such individual was George Green (1833–1902), who married, worked, and lived in rural Pennsylvania and Virginia. When his assigned sex was discovered upon his death, local newspaper accounts portrayed Green as a good husband, worker, and friend, and rather than pathologizing him and his marriage, the new reports legitimized him as a faithful Christian and cautioned others against judging him.

Some trans men, like Jack Bee Garland (1869–1936), Dr. Alan Hart (1890–1962), and Dr. James Barry (1789–1865), distinguished themselves in professional and military careers. Garland worked as a journalist embedded with U.S. troops in the Philippine-American war and enjoyed their acceptance, both before and after his assigned sex was discovered. Barry served in the British Army, where he rose through the ranks as a military surgeon to become inspector general overseeing all military hospital operations. Hart was a pioneering epidemiologist who modernized the treatment of tuberculosis, cutting the number of known cases by 80%.

As Skidmore shows in her work, the often upstanding lives led by 19th-century white trans men, coupled with their racial and class privilege,

enabled many of them to escape social ridicule and rejection when their assigned sex was revealed. In such instances, trans men were forced to explain to authorities why they chose to live as men, and they framed their stories in terms of normative white, male middle-class citizenship: their desire to serve the country, find suitable employment, be independent, and help others. Local newspaper coverage of white (and white-passing) trans men's gender and sexual nonconformity tended to downplay their transgression of the gender binary; instead, news stories highlighted their roles as breadwinners and heterosexual family men, who were hard workers, were faithful to their wives, and went to church on Sundays. They downplayed sexuality in their marriages and gave circumstantial reasons for crossdressing. When Kenneth Lisonbee's sex was discovered in 1929 in Los Angeles, he explained his sartorial and job preferences as the result of helping his aging, infirmed father with farm work after his older siblings moved away. He portrayed his relationship with his companion Stella Harper as an innocent friendship originating when he was working on the farm. Lisonbee's rationales cleverly shielded him and his companion from the charge of sexual impropriety, which was considered more contemptible than crossdressing. It also kept him from being labeled a "female sexual invert," a sexological term pathologizing women who were sexually involved with other women.

These trans men lived normative white male lives, building good reputations in their communities, which proved to be of vital importance when their assigned sex was discovered. For example, Willie Ray lived in Booneville, Mississippi, where he had been known all of his life as an honest, hardworking man. In 1903, he revealed his assigned sex in a court trial, which made newspaper headlines throughout the South. After winning the trial, Ray continued to live in Booneville, working in traditional men's trades, wearing men's clothes, and living with a female companion.

However, this acceptance was specific to white (and white-passing) trans men in the 19th and early 20th centuries. While they supposedly gained important citizenship rights (e.g., suffrage, marriage, property ownership, military service, pensions) through transitioning, trans men of color and immigrant trans men were often denied these rights and benefits because of racism and xenophobia. Having to contend with white supremacy and anti-immigration policies, trans men of color who were born in or migrated to the United States did not necessarily have better, freer lives as men. On the contrary, their visibility as men exposed them to the risks of lynching, criminalization, incarceration, deportation, and exile.

1940s–1970s

By the late 1940s, the pathologizing of people who deviated from normative gender and sexual expression became the dominant discourse, with the witch hunts led by Senator Joseph McCarthy against "suspected homosexuals" being emblematic of the more conservative era. During this time, the police increasingly raided queer bars and other public enclaves to harass and arrest patrons; individuals who crossdressed were particularly targeted because their gender nonconformity was seen as a clear affront to what was considered "public morality." The raid on the Stonewall Inn in New York City in 1969 is the most well-known example of the police attacking members of the LGBTQ+ community. But it was just one of hundreds of such raids that took place across the country in the 1950s and 1960s to persecute people who crossdressed or who were suspected of being gay.

Despite the generally less tolerant era, some trans men, like Jim McHarris (1924–), still found ways to live as men. McHarris was a Black itinerant worker who moved around the South and Midwest, taking various menial-labor jobs and occasionally preaching. In 1953, he settled in Kosciusko, Mississippi, hoping to marry and become a deacon in a local church. But the following year, McHarris's dreams were dashed when police officers stopped his car and interrogated him, and he was forced to reveal his assigned sex. The police jailed McHarris and made him strip naked in front of the judge and arresting officers to reveal his genitalia, then ordered him to pay a $100 fine or serve 30 days in jail. With no money or job prospects, McHarris served the time and had to do so in a women's prison. McHarris's treatment highlights the significance of race and class in the ways society sees and treats gender nonconformity. Transitioning to Black manhood opened doors for him that were closed to Black women (e.g., religious ordination) but also made

him vulnerable to racial oppression (e.g., aggressive police profiling) encountered by cisgender Black men during the Jim Crow era. McHarris was also treated more harshly, experienced greater humiliation, and was given a heavier sentence than white trans men whose assigned sex was discovered.

Moreover, unlike the rural communities in which white trans men lived, McHarris's community did not defend him. This may have been in part because African Americans initially saw their push for civil rights as depending on moral respectability (or at least its appearance), and anything less threatened to undermine the cause. In 1955, for example, 15-year-old Claudette Colvin defied bus segregation 9 months before Rosa Parks, but the NAACP chose not to use her case to challenge segregation laws after Colvin became pregnant later that year, as the attorneys felt that her pregnancy would be used against her in the trial. African Americans were keenly aware of how their sexuality had been pathologized to justify racist social policies, and as a result, generations of Black people chose to adhere to Victorian sexual mores as part of their strategy to counter racism.

However, the mid-20th century was not entirely negative for trans men. Testosterone pills became available in the late 1930s, and a few trans men, such as Michael Dillon (1915–1962), took advantage of the opportunity to masculinize their bodies. For these men, white, middle-class privilege was integral to their access to the newly synthesized hormone. Dillon, for instance, attended medical school at Trinity College in Dublin, where he mingled with elite medical professionals who were sympathetic to his desire to be recognized by others as a man. Like many other trans men of his era, Dillon had moved to a small town—Bristol, England—where he settled into a normative white male existence. He mingled easily with cis men in traditionally masculine jobs and enclaves and was accepted by them. However, Dillon soon recognized the limits of hormonal transition; he lived in constant fear that his sex assignment would be discovered, especially in situations where his body would be exposed (e.g., locker rooms, hospitals), because he did not have a penis.

As a physician himself, Dillon had professional relationships with other doctors, including Dr. Harold Gillies, who was performing phalloplasties to reconstruct the genitalia of cis men injured in World War II. Gillies was driven by a passion for medical discovery and innovation, and Dillon was a self-made, adventurous trans man in need of a penis. Together, they made the perfect pair to test phalloplasty's potential use for female-to-male transsexuals. Dillon had his first surgery in 1946 and completed the procedure in 1949.

While Dr. Harry Benjamin is widely credited with recognizing transsexualism as a medical rather than a psychological condition, Dillon was actually the first physician to make this argument, which he did in his 1946 book, *Self: A Study in Ethics and Endocrinology.* He contradicted the dominant psychiatric belief that gender dysphoria could be "cured" through psychotherapy and argued instead that doctors should treat trans people like any other patient population (e.g., military veterans and people with disabilities) and use medical technology (i.e., hormones and surgery) to enable them to live with dignity and authenticity.

While Dillon personally and professionally furthered the access of trans men to surgical and hormonal transition, Reed Erickson played an instrumental role in building institutions that supported medical transitioning for trans people in the 1960s and 1970s. Erickson founded the Erickson Educational Foundation (EEF), which funded trans-supportive clinical research (including Benjamin's work), social activism, and educational resources. The EEF published materials for trans people and their families and maintained a referral network of counseling services and medical providers who treated trans people. In addition, Reed's foundation functioned as a clinical research clearinghouse for physicians, psychologists, clergy, legal experts, and others wanting to understand gender dysphoria. Funding from the EEF helped establish the first clinic to specialize in the medical transitioning of trans people—at Johns Hopkins University in 1967—and the creation of the Harry Benjamin International Gender Dysphoria Association (HBIGDA), a professional organization for trans health care providers in 1979 (it subsequently became the World Professional Association for Transgender Health or WPATH). More than 40 gender clinics emerged in the next decade in the United States, and hundreds of practitioners began offering medical services to trans patients.

1970s–Present

Trans men became more visible in the 1970s. The efforts of early pioneers like Mario Martino, Steve Dain, Jude Patton, Rupert Raj, and Lou Sullivan laid the groundwork for increasing trans men's visibility by advocating for better access to transition treatment and building community institutions that addressed their specific gender journeys. Martino contributed to trans men's emerging visibility in the 1970s with his autobiography, *Emergence: A Transsexual Autobiography* (1977), and later operated a counseling center (The Labyrinth Foundation) and postoperative recovery house for trans people in Yonkers, New York. Dain was outed in a civil lawsuit, which he won for wrongful termination after he was fired from his teaching position for being trans. He subsequently played key roles in the early trans movement as a therapist, educator, and advocate. Patton, who had his surgeries at Stanford's gender clinic in 1970, gave lectures to health providers, researchers, and college students and was the first trans person to serve on HBIGDA's board. Patton took over the trans advocacy work of the Erickson Educational Foundation and cofounded J2CP (with Sister Joanna Clark), a trans educational nonprofit. Working in Canada, Rupert Raj undertook similar initiatives to change the medical world's treatment of trans people and disseminate medical and civil rights information to trans people.

Although the gender clinics were a major breakthrough for trans people, most who wanted access to them confronted many obstacles. Hormones, surgery, and therapy were exorbitantly expensive and beyond the reach of many trans people. This was especially the case for trans men, who, assigned female at birth and sometimes presenting in traditionally masculine ways, faced workplace and wage discrimination because of sexism and heterosexism. Trans men of color and immigrant trans men encountered additional hurdles of systemic racism and xenophobia in gaining access to gender clinics. Moreover, clinical programs used a heteronormative admissions process, accepting only applicants who identified as binary (male or female) and who would be heterosexual after medically transitioning. Justifying this exclusion were psychiatrists' conceptualization of homosexuality and transsexualism as mutually exclusive identities and their inability to conceive of the possibility of female transvestitism. Hence, trans men had more difficulty accessing treatment in gender clinics than trans women, and gay and bisexual trans men were entirely shut out if they did not feign a heterosexual identity.

Louis Sullivan, a gay trans man who was active in San Francisco's gay community, changed the views of many medical professionals by showing them that gay and trans identities were compatible and not mutually exclusive. Stanford's gender clinic twice refused to treat Sullivan because he was gay, but he was nonetheless able to access hormones and surgery in 1979, when HBIGDA published its first Standards of Care for providers, which paved the way for trans people (who could afford to do so) to medically transition outside the gender clinics. In 1986, when he underwent metoidioplasty, Sullivan learned that he had AIDS, which, at that time, was largely untreatable.

Sullivan spent the next 4 years educating medical professionals about trans people and helping build an international trans male network, before dying in 1991. Like Patton, Sullivan published a quarterly newsletter, *FTM International,* which provided advice and information about hormones and surgery, listings of trans-friendly therapists and counselors, stories of transition journeys, and trans legal and civil rights news. More than a resource, newsletters like *FTM International* told subscribers that they were not alone but, instead, were part of a larger global movement. Sullivan also published a pamphlet of transition guidelines, *Information for the Female to Male Cross Dresser and Transsexual,* to help trans men in navigating their gender journeys.

As his health was declining, Sullivan asked Jamison Green to take over publishing the quarterly newsletter and running a transmasculine support group that Sullivan had started. Green also continued Sullivan's correspondence with trans men from around the world, offering support and information resources, as well as building broad national and international networks. In addition, Green was an early advocate for education and open discussions of transness, arguing that the world would not be safe for trans people if no one knew that they existed. He also advocated for legal reforms and more responsive and responsible treatment from medical professionals, which

ultimately led to him serving on the board of directors of WPATH.

In the 1990s, new communication technologies (the Internet, cell phones, and social media platforms) made it easier for trans men to discover information about medical transitioning, find one another across vast geographical distances and national borders, and organize a global movement. However, race, ethnicity, and poverty continued to play key roles in limiting trans men's social and geographical mobility and access to medical treatment, as the murder of Brandon Teena in 1993 poignantly illustrates. Teena lived in Falls City, Nebraska, with his girlfriend, who knew he was trans. He wanted to medically transition, but his job as a gas station attendant made it difficult, if not impossible, for him to save enough money to afford hormones and surgery or to move to a more trans-supportive area like San Francisco or New York City, where he would have found a community of others like himself. When he was arrested for a misdemeanor, his birth name and sex were published in the local newspaper, which led to his rape and subsequent murder. In 1998, a documentary about Teena's murder, *The Brandon Teena Story,* brought international attention to hate crimes against trans people and to their frequent mistreatment by law enforcement officials. A year later, Teena's short life (and death) was dramatized in the film *Boys Don't Cry,* for which Hilary Swank won an Academy Award for her performance as Teena.

By the turn of the millennium, trans men were becoming more visible to one another and in the media, as they published academic studies and autobiographies, organized and attended conferences, and increased their activist efforts and artistic productions. A number of highly regarded research studies of (mainly white) trans men's lives, gender transitions, and embodiments were published during this time, including Aaron Devor's *FTM: Female-to-Male Transsexuals in Society,* Jason Cromwell's *Transmen and FTMs: Identities, Bodies, Genders, and Sexualities,* and Henry Rubin's *Self-Made Men: Identity, Embodiment and Recognition Among Transsexual Men.* Complementing these scholarly works were trans male autobiographies, such as Jamison Green's *Becoming a Visible Man,* Max Valerio's *The Testosterone Files,* and Matt Kailey's *Just Add Hormones,* which gave trans men more control over the representation of their lives. Authors could critically engage academic theories of gender and sexuality, educate a cis public that conflated trans men with butch lesbians, and inspire other trans men to transition out of their gender closets. Documentary films, like *You Don't Know Dick: Courageous Hearts of Transsexual Men, Southern Comfort, Becoming Chaz,* and *Still Black: A Portrait of Black Transmen,* added a visual component to written discourses by and about trans men. Photojournalist books, such as Loren Cameron's *Body Alchemy: Transsexual Portraits* and *Man Tool: The Nuts and Bolts of Female-to-Male Surgery,* proudly displayed the diversity of masculinities and bodily transformations of trans men. As the Internet continued to expand in the 21st century, social media platforms like YouTube and Facebook gave trans men more control over the representation of their stories, as they documented their transition journeys in vlogs and blogs.

Trans men also made inroads in law and law enforcement. Stephan Thorne, Kylar Broadus, Dean Spade, and Shannon Minter emerged as leading advocates for progressive changes in social policy affecting trans people. Thorne transitioned in San Francisco's Police Department in 1994 amid national media attention and became the nation's highest ranking trans officer after being promoting to lieutenant in 2008. He worked with other trans officers throughout the country to conduct gender sensitivity trainings in police academies and prisons. Kylar Broadus merged his skills as an entrepreneur and attorney in 30 years of indefatigable service to advisory boards and nonprofits for LGBTQ+ rights. Broadus also founded justice coalitions for trans people of color and, in 2012, became the first known trans person to speak before the U.S. Senate when he testified in support of the Employment Non-Discrimination Act.

Another legal activist, Dean Spade, started the Sylvia Rivera Law Project (SRLP) in 2002 to provide legal help to trans people targeted by the police's enforcement of gender norms, especially trans people of color and immigrants, who suffered the simultaneous effects of poverty, racism, homophobia, and anti-immigration policies. The scope of SRLP grew over the next decade to serve trans people in prisons, public schools, foster care, psychiatric hospitals, and immigration proceedings.

Shannon Minter emerged as one of the nation's leading legal advocates for LGBTQ+ rights, defending trans and queer people against discriminatory family and constitutional laws before the California (Proposition 8) and Florida Supreme Courts and the U.S. Supreme Court (*Christian Legal Society v. Martinez)*. In 2002, Minter gained national attention when he won the case of a trans man, Michael Kantaras, who was trying to keep custody of his children. Although the Florida Supreme Court reversed the case on appeal in 2004, Kantaras achieved joint custody in a mediated settlement.

Trans men's organizing continued to expand in the first two decades of the 21st century, as more men took positions on the boards of LGBTQ+ nonprofits, policy institutes, health collectives, and city and state planning committees to change laws and social policies adversely affecting them. Trans men's establishment of businesses, film festivals, social retreats, nonprofits, support groups, independent presses, and annual conferences, as well as their increasing presence in academia, the military, law, and government, made them visible in a way that was unimaginable even a generation ago.

Trans People of Color Coalition

Founded in 2010, the Trans People of Color Coalition (TPOCC) was the first national organization in the United States created to address the specific needs of trans people of color. Its mission is to provide a voice for trans people of color, foster community leadership, and advance justice for all trans people through trainings and presentations about the intersections of various forms of oppression, including racism, transphobia, and transmisogyny. At a time when the LGBTQIA+ right movement in the United States continues to be led primarily by white activists and often fails to focus on the issues that specifically affect trans people of color, TPOCC brings the experiences of trans people of color from the margins to the center of discussions and enables them to be seen as their full selves.

Early Activities

TPOCC was founded by trans attorney and activist Kylar Broadus after recognizing that the trans and larger LGBTQIA+ movements were often no better at addressing issues of racism and classism than the larger society. He hoped that the group could bring trans people of color together, consider their shared experiences, and then raise their concerns within the wider LGBTQIA+ and people of color communities and with local and federal policymakers and officials.

To foster community among trans people of color in its early years, the group hosted an annual hot dog roast in the Washington, D.C. area that attracted people from throughout the eastern United States. TPOCC has also sponsored gatherings for trans people of color at annual LGBTQIA+ and trans conferences, including holding an opening reception for years at the Philadelphia Trans Wellness Conference, and organized town halls in Los Angeles, Washington, D.C., and San Francisco to bring trans people of color together and hear their concerns.

In his role as executive director of TPOCC, Broadus testified before the U.S. Senate in support of the Employment Non-Discrimination Act (ENDA) in 2012. He was the first openly trans person to speak in front of Congress. TPOCC has also been on Capitol Hill to help organize the annual "OUT on the Hill" leadership summit with the National Black Justice Coalition.

Collaborations

TPOCC is perhaps best known for its collaborations with other LGBTQIA+ organizations to further the inclusion of trans people of color and their perspectives. It partnered with the National Center for Transgender Equality (NCTE) and the National LGBTQ Task Force on congressional lobby days to advocate for federal antidiscrimination and hate crimes laws that protect the rights of LGBTQIA+ people. TPOCC also worked with NCTE to recruit people of color for its two national studies of the trans community: the National Transgender Discrimination Survey (2011) and the U.S. Transgender Survey (2016). Both studies showed that trans people of color, especially trans women of color, were more likely to experience harassment, discrimination, and violence in all areas of life than white trans people.

TPOCC has also collaborated with trans-, LGBTQIA+-, and people of color–related conferences to include sessions focused on trans people of color. For example, the group has led workshops at the National Black Justice Coalition Conference and organized the first trans women of color panels at the National LGBTQ Task Force's Creating Change Conference and at the Trans Wellness Conference. The latter event was hosted by well-known actor and activist Laverne Cox, which helped draw attention to the hostile climate for trans women of color, including the fact that dozens of trans women of color are murdered each year, at a time when few people outside of trans people of color communities were discussing these issues. To further raise awareness about this pandemic of violence, TPOCC partnered with the Human Rights Campaign from 2015 to 2017 to release yearly reports that documented the individuals killed in the United States because of their gender identity or expression, the vast majority of whom were trans women of color. The group also worked closely with WITNESS Media Lab's "Capturing Hate" Project, which used eyewitness videos to document the extent of anti-trans violence.

Many people of color pursue careers in the military because other employment and education options are less readily available, and trans people of color are no different.

TPOCC was involved in challenging the Trump administration's ban on trans people being able to serve in the military. Working with GLBTQ Legal Advocates and Defenders (GLAD) and the National Center for Lesbian Rights, TPOCC reached out to trans people of color who were interested in enlisting, who were currently serving, or who had served in order to share their stories with the media as part of efforts to show the negative effects of the ban.

TPOCC has also partnered with some of the other trans people of color organizations that have been formed in recent years. With the TransLatin@ Coalition, TPOCC has sponsored panels and workshops at conferences and joined them in participating in rallies and marches. With Black Trans Media, TPOCC is organizing to address homelessness, food insecurity, and unemployment/underemployment among Black trans people and to respond to police violence against Black trans people, which is part of the larger targeting of Black people by law enforcement officials.

Significance

The dominant white society often treats "people of color" as a single, monolithic group, but there is tremendous diversity among people of color, and TPOCC is noteworthy for bringing different races of trans people together to address shared issues and be in solidarity with each other. Moreover, given that trans people of color often

feel marginalized in both predominantly white trans and LGBTQIA+ movements and predominantly cis racial justice movements, TPOCC has provided a space where trans people of color can be seen in their entirety and not have to de-emphasize a part of themselves. As a result, TPOCC has helped empower trans people of color and provided a sense of community to individuals who have often felt isolated, silenced, and invisible.

Trans Pride Flag

The Trans Pride Flag was developed for trans people to have a specific image to represent themselves, similar to how the LGBTQIA+ community in general is symbolized by the Rainbow Flag. Over the past 20 years, the flag has been widely adopted, such that it is commonly seen at LGBTQIA+ and trans events, on a vast array of trans-themed merchandise, and in media coverage of trans people. Having a flag of their own has been critical to increasing the visibility of trans communities and to helping trans people feel included and recognized. The flag has also served as a unifying symbol, as it has been adopted by trans people around the world.

The Flag's Origins

The most popular version of the Trans Pride Flag was developed by U.S. trans activist Monica Helms in 1999. She was urged to create it by Michael Page, who had designed the Bisexual Pride Flag and felt that the trans community likewise needed to be represented by its own flag. She came up with a flag consisting of five horizontal stripes of equal width: light blue stripes on the top and bottom, pink stripes next to them, and a white stripe in the middle. Helms chose these colors because light blue is traditionally associated with boys and masculinity and pink with girls and femininity. The white stripe stands for nonbinary trans people. Helms also chose to design the flag to be horizontally symmetrical, saying in an article in *ThinkProgress* that "no matter which way you fly it, it is always correct, signifying us finding correctness in our lives."

Displaying the Flag

Helms, who lived in Phoenix, Arizona, at the time, debuted the Trans Pride Flag at the Phoenix Pride Parade in 2000, where she carried it as part of the color guard, as Helms is a Navy veteran. She subsequently took the flag to other LGBTQIA+ parades, conferences, and events, and it gradually started to be adopted by other trans people and groups. The flag began to be extensively used at Transgender Day of Remembrance events and pride parades around the world in the late 2000s, as it became a way to visually symbolize the trans community. The flag also appears widely today at International Transgender Day of Visibility events and other trans awareness activities.

Some U.S. state and federal officials have displayed the Trans Pride Flag to indicate their support for trans rights. The Philadelphia Mayor's Office began raising the flag over its city hall in 2015 to mark the opening of the Philadelphia Trans Wellness Conference, and California Governor Gavin Newsom ordered the flag to be flown from the state capitol in 2019 in honor of the Transgender Day of Remembrance. Other U.S. cities that have raised the flag to mark trans events include San Diego, San Francisco, and Salem, Massachusetts. Members of Congress have also hung the flag outside of their Capitol Hill offices in solidarity with trans people, beginning in 2019 with then newly elected Representative Jennifer Wexton from Virginia. For the International Transgender Day of Visibility in 2019, several dozen legislators, including 2016 and 2020 presidential candidate Bernie Sanders and House Speaker Nancy Pelosi, displayed Trans Pride Flags, which were provided to all members of Congress by the National Center for Transgender Equality.

On August 19, 2014, exactly 15 years after she came up with the idea for a Trans Pride Flag, Helms donated the original flag to the Smithsonian's National Museum of American History to be part of its LGBTQ+ history collection. Discussing the importance of the flag being acquired by the federally run museum, Helms stated to *ThinkProgess,* "It tells the world that trans people are part of this country" and that "we deserve to be recognized, and our history needs to be displayed like everyone else's." Along with being shown at the museum, the flag was included in a Smithsonian exhibit at the White House for the Obama administration's celebration of Pride Month in 2016. Another honor was the approval of a trans flag emoji in 2020 by the Unicode Consortium, the organization that oversees the creation of new emojis.

Significance of the Flag

The importance of having a trans flag is indicated by how quickly and widely the Trans Pride Flag has been adopted by trans communities and the larger society. For the unprecedented number of younger people who are out as trans today, the flag provides a sense of empowerment and community and a way to communicate their identity to others. For trans individuals who are not out or who are struggling with being trans, the flag offers a sense of belonging and enables them to feel less isolated; they may not feel comfortable being involved with the trans community, but they can benefit from knowing that there are trans people who are open and proud of their gender identity. The flag also brings visibility and legitimacy to the trans community. Just as the Rainbow Flag has become almost universally known as a symbol of LGBTQIA+ communities, the Trans Pride Flag is increasingly recognized internationally as an emblem for trans people. Its growing prominence helps raise awareness of trans communities and, with it, hopefully greater acceptance.

Trans Studies

Trans Studies, also known as Transgender Studies, is an interdisciplinary field that approaches the study of sex, gender identity, gender expression, gender stereotyping, and the social constructions of gender in historic and contemporary contexts. Through intersectional approaches, Trans Studies considers the complexity of sex assigned at birth and the social constructions of gender within the contexts and constructs of race, ethnicity, socioeconomics, national identity, global location, physical and mental (dis)ability, decolonial recovery, and religion, as well as other identities. As an interdisciplinary field, Trans Studies crosses the humanities, social sciences, and behavioral and medical sciences, bringing together insights into art, culture, history, literature, lived experiences, media, medicine, politics, and social practices. In particular, Trans Studies draws upon the legacy, insights, and practices of other social justice–oriented fields of study, including Ethnic Studies, Women's and Feminist Studies, Cultural Studies, Labor Studies, and Queer Studies. This entry examines the evolving field of Trans Studies in contemporary and historic contexts.

Academic Roots: Ethnic, Feminist, Queer, and Trans Theories

Trans Studies has its academic and theoretical roots in the intersections of ethnic, feminist, and Queer Studies, which, beginning in the late 1960s and early 1970s, became burgeoning fields of study evolving from the civil rights movement, the United Farmworkers movement, the American Indian movement, the Women's movement, and the LGBT movement. Within these social justice movements, there were robust discussions focused on intersecting oppressions and intersecting resistance. In response to these grassroots social justice movements, academic institutions began offering courses in Ethnic Studies and Women's Studies and/or Feminist Studies (in some cases also including the works of LGBT activists and authors). Feminist Studies, by its nature, explores the difference between sex assigned at birth (often referred to as biological sex or chromosomal sex) and gender as a social construct. Sex and gender are often conflated; however, Feminist Studies disentangles the difference between the biological and chromosomal sex and the social and cultural constructions of gender that become tied to sex. Feminist Studies in the late 20th century focused on both sex and gender within a binary frame: female or male and what it meant to be a woman or a man. During the late 20th century, there was less consideration of gender diversity such as the rich cultural heritage of Indigenous communities that had, historically, honored third gender identities and, in some cases, fourth and fifth gender identities. Many of the theorists defining the field of Feminist Studies during this time focused on white cisgender women. However, starting in the early 1970s, numerous books and essays penned by various women of color resisted these specifically white and often middle-class definitions of feminism. Essays like the 1977 Combahee River Collective Statement, written by a collective of radical Black lesbian feminists, and Cherríe Moraga and Gloria Anzaldúa's 1981 anthology of collected works by women of color, titled *This Bridge Called My Back: Writings by Radical Women of Color,* not only presented writings by feminists of color, but part of the critique within these two works and others focused on stereotypically Eurocentric definitions of femininity and masculinity. Although most of these writings do not discuss trans people per se, they do interrogate inherently fixed racist notions about gender identity and gender expression.

Feminist Theory and Controversy

In the late 1970s and early 1980s, some Women's Studies and/or Feminist Studies courses did include trans materials—specifically the groundbreaking text *Mother Camp: Female Impersonators in America,* by Esther Newton, which was originally published in 1972 and reissued in 1979. Today, the language in Newton's book might seem disrespectful; however, at the time it was written, Newton was taking trans experiences seriously. Another pivotal book was also published in 1979: Janice Raymond's *The Transsexual Empire: The Making of the She-Male.* Raymond's text, however, argued that trans women were not "really" women and that trans issues should not be considered within feminist theory. Newton's and Raymond's books exemplify some of the theoretical controversies

that some feminist writers had around trans inclusion within Feminist Studies. It is important to note, though, that just because a writer, activist, or theorist was part of the 1970s and 1980s feminist movement, that does not automatically mean they were against trans rights.

Feminist Theory as Gender Theory

In 1987, Teresa de Lauretis wrote a groundbreaking book titled *The Technologies of Gender.* In this text, de Lauretis theorizes multiple gender possibilities by arguing that gender is inextricably linked to issues such as race, socioeconomics, and other intersectional factors. Her work, which focuses on literary and film theory, specifically opened up possibilities of multiple gendered readings outside of a male/female binary. Indeed, de Lauretis's book was one of two major works that began to change the ways that gender was written about and discussed within the areas of literary and film theory. Three years later, Judith Butler published the second major work, *Gender Trouble: Feminism and the Subversion of Identity* (1990). Butler theorizes that gender for all people, regardless of whether they are cis or trans, is a performance. Butler's philosophical take on gender identity and gender expression is complex and continues to be used within Trans Studies today. *Gender Trouble,* in particular, is recognized as one of the core texts in queer theory, which began in the late 1980s and early 1990s.

Queer Theory

Grassroots political activism in the early 1990s—a decade into the AIDS pandemic with no foreseeable cure—and political groups like Queer Nation helped establish a new area in academia: queer theory. Reclaiming the label "queer" was crucial to creating queer theory because by reclaiming the term, there was ownership and empowerment. In the 1990s, the term *queer* was meant to be an umbrella term that embraced everyone in the gay, lesbian, bisexual, and transgender community. Queer Studies, like Feminist Studies, initially focused on predominantly Eurocentric narratives such that lived experiences of queer people of color were often not represented in queer scholarship. And, as many lesbian feminists argued, Queer Studies predominantly focused on cis white gay men. Similarly, Queer Studies often overlooked both bisexual and trans experiences as well. For example, some initial explorations of the Harlem Renaissance within Queer Studies focused solely on identifying some of the African American artists as solely gay or lesbian, whereas in reality, many of these artists were actually bisexual and/or gender "outlaws" like Gladys Bentley. Over time, Queer Studies has evolved to become much more inclusive of multiple lived experiences and has become, like Feminist Studies, a robust interdisciplinary field focusing on the intersections of sexual orientation, gender identity, gender expression, race, ethnicity, socioeconomics, and other intersecting factors.

Trans Studies

The 1990s are popularly marked as the decade in which trans activism emerged. However, with trans activists of color like Sylvia Rivera, Marsha P. Johnson, and Miss Major Griffin-Gracy—all part of the resistance against police brutality at the Stonewall Riots in New York City in June 1969, or the decade before that, in 1959 in Los Angeles when a group of trans and queer people of color rioted for one night against police abuse—it is clear that trans activism and trans resistance, particularly for trans people of color, existed well before the 1990s. In 2004, Susan Stryker, a trans theorist, historian, and filmmaker, wrote the essay "Transgender Studies: Queer Theory's Evil Twin," which became one of the first theoretical pieces to move Trans Studies out from under the queer umbrella and to illuminate Trans Studies as its own field. Prior to Stryker's 2004 essay calling queer theory to task for excluding trans people's experience, there were already a growing number of scholars in the field of what, today, we call Trans Studies. Leslie Feinberg, a trans activist and author, published an autobiographical booklet in 1980 titled *Journal of a Transsexual,* and then in 1992, Feinberg published *Transgender Liberation: A Movement Whose Time Has Come.* Four years later, ze published *Transgender Warriors: Making History From Joan of Arc to Dennis Rodman,* which covers the history of trans people around the world and focuses on the intersections of race, global location, and gender diversity in Indigenous cultures throughout history. In 1997, Aaron Devor, a trans sociologist, published one of the first books

to focus on transmasculine experience in *FTM: Female-to-Male Transsexuals in Society*, and in 1998, Dallas Denny, an independent trans researcher and scholar, published *Current Concepts in Transgender Identity*. Like Feminist Studies and Queer Studies, Trans Studies initially focused on white trans experience within Western medical frameworks in part because the terminology of *transgender* has come through Western medical modes.

In the first two decades of the 21st century, Trans Studies has established itself as a robust interdisciplinary field. Trans Studies continues to evolve to explore Indigenous narratives of gender diversity, decolonial narratives focused on gender outside of the male/female, and the intersections of gender expression, race, socioeconomics, and (dis)ability. From the late 1990s on, various trans documentary films have also chronicled the lives of trans people around the world. The 2001 documentary by Kate Davis, titled *Southern Comfort,* explores the life of Robert Eads, a trans man living in poverty in rural Georgia, who is shunned by doctors when he seeks cancer treatment. This film illuminated the ways that U.S. medical practice can be transphobic. That same year, the documentary film *Georgie Girl* focused on Georgina Beyer, a Māori trans woman in New Zealand who was the world's first known trans person elected to parliament. This film focuses on the intersections of colonial violence and decolonial recovery, race, sex work, and trans identity. Also, in 2001, the Hawai'ian film, *Ke Kulana He Mahu: Remembering a Sense of Place,* focused on third gender identities in Indigenous Hawai'ian culture. Hinaleimoana Wong Kalu (also known as Kumu Hina) is *māhū* and teaches ancient Hawai'ian cultural traditions in a middle school. The film focuses on her decolonial activism and teaching; she continues to teach about intersecting identities and intersecting oppressions within Western trans frameworks and is featured in two other documentaries. In 2005, an Indian documentary, *Harsh Beauty,* explored the 4,000-year-old tradition of *hijras*—a third gender group—in India. The film also focuses on the devastating ramifications of colonial violence and the imposition of the English language on a group of people who already had a name in their own language and who already had a specific social and cultural purpose as hijras. A large part of Trans Studies in the 21st century has interrogated and moved away from the Eurocentric definitions and Western medical models that established Western notions of trans identity and medical gender transition protocols.

History of Trans Studies Within a Western Scientific Model

The evolution of Trans Studies within a Western scientific model is linked to the field of sexology, which was a burgeoning area of European study in the 19th century. Sexology came out of the 19th-century theories of Enlightenment and the practice of using taxonomies to identify people, plants, and animals. Richard von Krafft-Ebing (1840–1902), an Austrian scientist, became famous for his massive study of sexuality in *Psychopathia Sexualis: With Especial Reference to Antipathic Sexual Instinct: A Medico-Forensic Study,* which was published in German in 1886 and then translated into English in 1892. Krafft-Ebing was one of the first scientists to research and write about people who did not identify with their sex assigned at birth. He conducted hundreds of interviews over several years to create this taxonomy of sexual differences. In so doing, Krafft-Ebing inadvertently created a model that conflated sexual orientation and gender identity. Some of Krafft-Ebing's case studies proved to be the first known European studies of trans people. Krafft-Ebing helped define the field of "abnormal" sexuality as well as "abnormal" gender presentation because the model he used as a measure of normalcy was male, heterosexual, and cis (although the terms *heterosexual* and *cis* were not in use at the time). Krafft-Ebing's intent was to move away from the Catholic Church's model of sin toward a medical model in order to gain sympathy for the people he studied. The dangerous precedent Krafft-Ebing inadvertently set was one that would label gay, lesbian, bisexual, and trans people as sick. This stereotype has continued into the 21st century.

One of Krafft-Ebing's students was a young gay Jewish scientist, Magnus Hirschfeld (1868–1935). In 1919, Hirschfeld opened the Institute for Sexual Science (Institut für Sexualwissenschaft) in Berlin, where he and his colleagues welcomed people of all gender expressions, gender identities, and sexual orientations. At the time Hirschfeld opened the

institute, Weimar Berlin was one of the most progressive cities in the world as far as gender and sexual orientation diversity were concerned. Although Berlin was progressive, Paragraph 175 of the German Penal Code, which made male homosexuality illegal, was still the law of the land. In many cases, Hirschfeld noted that people assigned male at birth who wore women's clothing were often arrested under Paragraph 175. (This same type of law was also present in England, and countless people who, today, might identify as trans women were arrested for male homosexuality.) Hirschfeld studied the people assigned male at birth who often risked their jobs, their homes, and their families to be able to wear women's clothing. Hirschfeld found that these particular people were very different from the people assigned male at birth who enjoyed performing in feminine drag at the various cabarets. In the first two decades of the 20th century, Hirschfeld became one of the first sexologists to argue that there was a difference between gender identity and gender expression and sexual orientation. Hirschfeld used the term *transvestite* for people assigned male at birth but who dressed and identified, to varying degrees, as female. He and his institute worked to get legal recognition for transvestites so that they would not be arrested under Paragraph 175. In 1930, the Danish artist Lili Elbe underwent one of the first gender affirmation surgeries at Hirschfeld's institute. Elbe died a year later after complications from a follow-up surgery. Two years after Elbe's death, the Nazi Party invaded the institute and burned the extensive library full of pioneering texts on sexology. Magnus Hirschfeld died in exile in 1935 in Nice, France.

In 1966, Dr. Harry Benjamin, who had been one of Hirschfeld's students in Berlin, published a book that completely changed the landscape for trans people as well as research in sexology and Trans Studies. His book, *The Transsexual Phenomenon,* was published in English in nonscientific language so that it was accessible to the general public. Benjamin's book became the basic guidebook for trans people seeking medical and surgical gender affirmation. In 1979, the Harry Benjamin International Gender Dysphoria Association (HBIGDA) was founded and created standards of care for trans health care. In 2007, the group renamed itself the World Professional Association for Transgender Health (WPATH). These standards of care have helped many trans people to go a long way toward living their authentic lives.

The Western medical model, however, has notoriously proven to consistently pathologize trans people. For example, the American Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders* (*DSM*) established a series of mental disorders starting with "Transvestic Fetishism" in 1952 and continuing with "Gender Identity Disorder" in 1980, until publication in 2013 of the fifth edition (*DSM-5*)—when the term *gender dysphoria* was introduced as an effort to destigmatize. The *DSM,* a product of the Western scientific model, also works as a gatekeeping mechanism, since trans people who want to and are able to seek medical transition have to abide by the diagnosis. This model often works for people with privilege, and it still focuses on gender that is binary. This Western scientific model resists people who do not identify specifically as male or female; they struggle with agender, nonbinary people, and two-spirit people. For many trans people who would like hormone therapy or other types of medical help, Western medical care is not fully accessible because it is still very expensive. Many trans people do not want any sort of medical modifications; they fight for the right to identify themselves without medical intervention.

History of Global Cultures and Language Around Gender Diversity

The Western medical model and the German sexologists are one place to search for the evolution and history of trans people and are a crucial part of Trans Studies. However, these 19th-century scientists were, in some cases, thousands of years behind numerous global cultures that already recognized and respected gender identities outside of a male/female binary.

Part of the complexities of understanding Indigenous gender identities and cultures that honored multiple and diverse gender identities is the violent intervention of European imperialism and subsequent European colonization. Prior to colonization, Indigenous languages, cultures, and customs already reflected and often embraced gender diversity; however, European cultural ideals, including the binary sex and gender system and codes of dress, were forced upon various cultures.

In India, for example, the hijras existed for 4,000 years before the British established the East India Company in 1600. Once the British were established in India, the hijras were mislabeled "eunuchs" and criminalized under British law. Hijras are male-assigned individuals (although some hijras are born intersex) who traditionally underwent a penectomy (the removal of the penis) as a sacrifice to the goddess Bahuchara Mata, who then granted them the ability to confer fertility to others. Historically, hijras have been very important in Indian society, even though they often existed at the bottom of the caste system. Hijras have always been thought to have special powers of blessing nuptials, newborns, and even businesses. Serena Nanda's 1989 publication *Neither Man nor Woman: The Hijras of India* explores the history of hijras.

In the Indigenous cultures of the Americas, almost every tribal nation had a specific name for a person who embodied gender diversity. The Navajo culture distinguishes a five-gender system based on age and honors the figure of the Nadléeh, who embraces all genders. The third gender, *asegí,* in the Cherokee Nation and the *winkte* in Lakota culture illustrate that gender diversity was honored within Indigenous communities prior to colonization. In 1990, a gathering of Indigenous peoples offered *two-spirit* as the best term to encompass indigenous gender diversity and sexual orientation. Numerous books, articles, and art installations explore Indigenous cultures and gender diversity. For example, in their 2016 book *Asegi Stories: Cherokee Queer and Two-Spirit Memory,* Qwo-Li Driskill explores the history of gender diversity and gender fluidity in the Cherokee Nation. Kent Monkman, a Cree two-spirit artist, focuses his paintings and performance art on decolonial recovery and empowerment. For example, in his 2019 painting, *The Deluge,* Monkman depicts the two-spirit figure rescuing Indigenous children from the side of a cliff as the coming storm of colonialism is ready to break on the horizon.

Into the Future

Trans Studies continues to be an ever-evolving, interdisciplinary field. Books and articles that are Trans Studies in focus can be found in Ethnic Studies, humanities, arts, Social Justice Studies, law, medicine, history, psychology, anthropology, Gender Studies and Feminist Studies, and LGBT Studies and Queer Studies. There are entire programs around the world that focus on Trans Studies, such as the University of Victoria's Trans Archives, the world's largest trans archive, which holds a biennial global Trans Studies Conference—Moving Trans History Forward. At the University of Arizona, Susan Stryker founded the Trans Studies Research Cluster (TSRC), which supports the journal *Transgender Studies Quarterly,* published by Duke University Press. The TSRC also hosts trans activists, researchers, and artists from around the world. There are Trans Studies courses all over the United States from the community college level through doctoral programs. Internationally, there are a growing number of Trans Studies scholars and researchers doing work, from trans medical studies in Thailand to growing research in Trans Studies in India that focus not only on hijras but also on trans men, trans women, and nonbinary trans people.

Trans Women

The identity *trans women* emerged in 20th-century Europe and North America, but traditions and identities in European and non-European societies anticipated the emergence of contemporary trans identities. While a universally accepted definition of *trans woman* is not possible, trans women are becoming more visible and gaining greater acceptance in the United States and other countries, even as they continue to experience pervasive discrimination, harassment, and violence.

Trans in Premodern Non-Western Societies

It is important to recognize that while the terms *trans* and *transgender* are of late 20th-century origin, people who anticipated contemporary trans women date back centuries. In fact, evidence suggests that individuals assigned male at birth who took on traditionally female roles and dress existed in many premodern cultures and were often connected with indigenous shamanic traditions. There are many such examples from South and Southeast Asia, including the *hijra* of India, who undergo ritual castration in order to devote themselves to the Hindu goddess Bahuchara Mata—a tradition that has survived in India to the present day. Vietnam also has an ancient indigenous tradition of goddess worship known as *dao mau,* which is presided over by shamans, many of whom might be understood as trans women, using contemporary terminology. Another such tradition is that of the *bissu* of South Sulawesi in the Indonesian archipelago. Korea has the tradition of the *paksu mudang,* the male shaman who traditionally might have lived as a woman or at the very least donned the garb of the *mudang* to perform sacred rites and rituals.

Premodern Pacific Islander cultures had what anthropologist Gilbert Herdt (1994) called "third sex/third gender subject positions" (p. 69) for individuals assigned male at birth who evinced a feminine gender identification; these included the *māhū* in Hawaii, the *fa'afafine* in Samoa, the *fakaleiti* in Tonga, the *faka sa lewalewa* in Fiji, the *rae rae* in Tahiti, the *fafafine* in Niue, and the *akava'ine* in the Cook Islands. The Māori of New Zealand had several different terms for those whose gender identity was different from their assigned sex, including *whakawahine, whakaaehinekiri, tangata ira wahine, hinehi,* and *hineua* for those who might be termed, in contemporary terminology, trans women and *tangata ira tane* for trans men.

Trans in Premodern European Societies

It is not only non-Western societies that had third sex/third gender subject positions. Premodern European societies also had traditions that anticipated contemporary trans identities, such as the male-assigned individuals with feminine comportment in Viking and pre-Viking Nordic societies who participated in *seiðr* (which can be translated from Old Norse as "prophecy" but also included what would be understood as "sorcery" or "witchcraft"). The *galli* were the eunuch priestesses of the

Phrygian goddess Cybele, whose practices were documented in the ancient Near East and later in parts of the Roman Empire, including Gaul. There is evidence of similar practices among the Druids in pre-Christian Ireland, Britain, and Gaul.

Charles-Geneviève-Louis-Auguste-André-Thimothée d'Éon de Beaumont (1728–1810), a French diplomat and spy, was the first known individual in European history whom contemporary trans women might see as anticipating their gender identity. After presenting for nearly 50 years as mostly a man, she spent more than 30 years living as a woman. Louis XV sent the Chevalier d'Éon to St. Petersburg, Russia, where she represented the French king at the court of the Empress Elizabeth. Accounts suggest that while there, d'Éon privately dressed as a woman, and rumors circulated that she was actually female. In 1775, Louis XVI wrote to d'Éon in London, requiring that the Chevalier adopt a permanent feminine gender presentation as a condition of her return to France, a stipulation that she accepted with some ambivalence. She spent most of her later years in England, where she publicly identified as a woman, the Chevalière d'Éon, and became a celebrity. Upon her death, she was discovered to have been assigned male at birth. Her fame led physician Havelock Ellis to coin the term *eonism* in 1920 to describe male-assigned individuals who presented and/or lived as women. A British association for crossdressers named themselves the Beaumont Society in 1966.

d'Éon may have been the first documented male-assigned public figure in European history to live as a woman, but she would be followed by other well-known individuals in the coming century. For example, Ernest Boulton presented herself as "Lady Stella Pelham Clinton"—and claimed to be married to Lord Arthur Pelham Clinton—in 19th-century Victorian England. With her friend Frederick William Park (a.k.a. "Fanny"), Boulton was arrested on charges of sodomy while exiting the Royal Strand Theatre in London in 1870 after the two had used the ladies' room in the theater.

The 20th Century

It is of course in the 20th century that trans women became publicly recognized as such (even though terminology evolved considerably over the course of the last century). Magnus Hirschfeld's pioneering work *Transvestites: The Erotic Drive to Cross-Dress,* the first major academic study of trans people, which profiled several individuals who would be considered trans women today, was published in 1910. Hirschfeld opened his Institute for Sexual Research, the world's first institute devoted to the study of sex and gender, in Berlin in 1919; it also performed the earliest recorded genital transformation surgeries.

Advances in gender-affirming surgeries and hormone replacement therapy (HRT) made it possible to reconfigure anatomy and biology in a way that was not possible before the 20th century (other than crude castration or amputation of the penis and scrotum). The earliest documented cases of gender-affirming surgeries were those of Dora Richter, Toni Ebel, and Lili Elbe (Lili Ilse Elvenes). Richter, who was born into a poor German family, is the first trans woman known to have undergone genital transformation surgeries, having had an orchiectomy (removal of the testicles), a penectomy (removal of the penis), and a vaginoplasty (construction of a vagina) at Hirschfeld's institute, where she worked as a domestic servant to pay for treatment. There is no record of her after an attack on the institute by a Nazi mob in 1933, so it is unlikely that she survived it.

Toni Ebel, who was also German, lived and worked as a woman in her 20s before reverting to living as a man, which included marrying a woman and having a son. But, unhappy presenting as a man, Ebel attempted suicide several times, and after the death of her wife, she resumed living as a woman. Like Richter, Ebel moved into and worked at Hirschfeld's institute, where she underwent gender-affirming surgeries. After the Nazi takeover, Ebel fled to Prague, and after World War II, she settled in East Berlin, where she worked as an artist. She died at the age of 80 in 1961.

Lili Elbe, the most famous of the women who had early gender-affirming surgeries, also was an artist in her native Denmark; she died tragically in 1931 at the age of 48 from an infection after her immune system rejected a transplanted uterus. Elbe's story became the subject of *The Danish Girl,* a 2000 novel by David Ebershoff, which served as the basis for a 2015 film of the same name.

Public consciousness of trans women exploded with the media attention given to Christine

Jorgensen's hormone replacement therapy and gender-affirming surgery (a penectomy performed in Copenhagen) in 1952. When Jorgensen returned to the United States the following year, she became a sensation, generating front-page headlines. What made Jorgensen such a celebrity when other trans women had had surgery before her was how she fit into dominant U.S. tropes of the time. She had been a serviceman, the epitome of masculinity in post–World War II America, and had been reborn into a "blonde bombshell," the embodiment of 1950s white feminine beauty. News stories fixated on Jorgensen's appearance and how she looked and acted like a "regular" woman, which was reinforced by a deeply heteronormative discourse about her having been "a woman trapped in a man's body." But, despite the tabloid-like coverage, the publicity about Jorgensen's transition was the first time that most trans women had heard about someone else like them, which enabled many to better accept themselves and realize that they too could medically transform their bodies in ways that would affirm their gender identity.

After Jorgensen, the next trans woman to become widely known was Renée Richards, who successfully sued the United States Tennis Association for discrimination under New York City law when the organization barred her from competing as a woman in the 1976 U.S. Open. While Richards set an important legal precedent and helped set the stage for trans women to participate in women's sport, she has since regretted her decision to challenge the ban on trans women playing professional tennis and expressed opposition to the Olympics allowing fully transitioned trans women to compete, because of their supposed biological athletic advantage.

Contemporary Trans Women

By far the most widely covered transition of a trans woman in the early 21st century was that of Caitlyn Jenner, who had become a national sports hero when she won the gold medal in the men's decathlon at the 1976 Summer Olympics and who subsequently achieved fame as a reality television star and a member of the Kardashian family. Jenner's public acclaim and ubiquity before her transition contrasted with the relative obscurity of Jorgensen and Richards before their transitions, making Jenner's transition particularly culturally significant. Her coming out as a trans woman in 2015, which included a primetime interview on ABC and a cover story in *Vanity Fair* magazine, generated national and international headlines and enormously enhanced the visibility of trans women and the trans community more broadly. However, her public image was subsequently tarnished within and outside the LGBTQIA+ community when she made positive comments about Texas Republican Senator Ted Cruz and Donald Trump before Trump's election as president of the United States in 2016. But even though Jenner's reputation has declined precipitously among trans people, her transition nonetheless helped educate many cis people about the trans community and received a largely favorable response in the mainstream media and among the general public.

Most of the trans women who have historically achieved fame have been white, and many have had the resources to afford surgeries to look more traditionally female, such as facial feminization surgery, and to have extensive and expensive wardrobes. In contrast to white trans women like Jenner, who have always enjoyed white privilege even while struggling with their gender identity, a small but increasing number of trans women of color are achieving prominence in the public sphere, such as Janet Mock and Laverne Cox. Mock publicly came out as trans in a 2011 article in *Marie Claire* and subsequently became a contributing editor at the magazine. She also served as an editor at People.com and hosted an online MSNBC talk show. In 2018, Mock was hired to be a writer, director, and producer for *Pose,* becoming the first out trans woman of color to serve in these positions on a television show. The following year, she agreed to develop her own television series for Netflix, making her the first trans woman of color to have such a deal with a major television/streaming company. Her 2014 memoir of her youth and teen years, *Redefining Realness,* was similarly the first bestselling autobiography by a trans woman of color. Her subsequent memoir in 2017, *Surpassing Certainty,* focused on her experiences in her 20s, when she was seeking to break into the white, male-dominant world of magazine publishing.

Laverne Cox first became known in 2008 for appearing on VH1's *I Want to Work for Diddy,* a reality show in which contestants competed to be

hired by music mogul Sean "Diddy" Combs. She was the first out Black trans woman to appear on a reality TV show. Cox became famous for her role in the Netflix series *Orange Is the New Black,* for which she was the first openly trans person to be nominated for a Primetime Emmy Award in an acting category. She would receive three Primetime Emmy Award nominations for the role and won a Daytime Emmy Award in 2015 for "Outstanding Special" as executive producer of *Laverne Cox Presents: The T Word,* an MTV documentary about the experiences of trans youth. Cox was also the first openly trans person to be appear on the covers of *Time* and *Essence* magazines, in 2014, and *Cosmopolitan* magazine, in 2018.

Of course, most trans women transition outside the public eye, and Jorgensen, Richards, Mock, Cox, and above all Jenner are extremely unusual in their celebrity status, as well as in their ability to medically transition in ways that fulfill cis feminine standards of beauty. Some trans women are not interested in fully medically transitioning or cannot afford to do so; instead, they might limit medical treatment to taking hormones or just socially transition by changing their names, pronouns, and how they present. At the same time, an increasing number of trans people are identifying as nonbinary, including some trans women. Even if they could be seen as strictly "women," they choose not to do so, challenging the notion of "man" and "woman" as fixed identity categories.

Discrimination, Harassment, and Violence

The unhappiest aspect of life for trans women is the pervasive discrimination, harassment, and violence that they face in most countries around the world. While the data are not comprehensive, studies suggest that trans women, especially trans women of color, in the United States and other countries are regularly subjected to discrimination and violence because of the intersecting oppressions of transphobia, misogyny, and racism—what is known as *transmisogynoir.* The National Coalition of Anti-Violence Programs (NCAVP) reported 12 "hate violence homicides" of trans women of color in the United States in 2013, 10 in 2014, 13 in 2015, 17 in 2016, and 22 in 2017. Of the 30 trans people known to have been killed in the United States in 2019 because of their gender identity or expression, 27 were trans women of color. Internationally, 331 trans and gender-nonconforming individuals, the vast majority of whom were trans women, were reported murdered in 2019. Murders are only the most extreme form of violence, of course, and these figures are undoubtedly an undercount, since anecdotal evidence suggests that most violence against trans women and especially trans women of color is not reported either to the police or to LGBTQ advocacy organizations such as the NCAVP. Moreover, the police and mainstream media may not recognize a murder victim as being trans or classify their murder as a hate crime.

One factor that contributes enormously to violence against trans women in the United States and other countries is the pervasive discrimination in employment that forces many into survival sex work, which makes them much more vulnerable to police harassment and brutality, as well as to violence from clients and others and to sexually transmitted infections. Decriminalizing sex work, which is gaining support in the United States, would significantly improve the lives of many trans women.

The 2015 United States Transgender Survey is the largest study to date to measure the extent of discrimination, harassment, and violence against trans people. It found pervasive mistreatment, with 46% of respondents reporting verbal harassment, 9% physical assault, 10% sexual assault, and 30% being fired, denied a promotion, or experiencing some other form of mistreatment in the workplace because of their gender identity or expression in the year prior to completing the survey. Trans women, especially trans women of color, were more likely than other trans people to have been verbally harassed or physically attacked in public by strangers and were more likely to indicate having lost a job because of being perceived as trans. However, the survey also found growing visibility and acceptance for trans people in the dominant U.S. society.

Trans Women in Popular Culture and Public Consciousness

The greater visibility of trans women results not only from more trans women being out and willing to become public figures but also because of more frequent, largely sympathetic representations

in popular culture and the mainstream media. Some of the first positive images of trans women were through their appearances on daytime talk shows like those of Merv Griffin, Phil Donahue, Sally Jessy Raphael, and Oprah Winfrey beginning in the 1970s. The importance of such representations is demonstrated by a story told by trans actor Alexandra Billings. She was about to take her life in 1980 when she saw three trans women on *The Phil Donahue Show.* It was the first time she had seen other people like herself who were leading successful lives, and it enabled her to know that she was not alone and could have a future.

Portrayals of trans women in films and television shows in the 2000s greatly increased awareness of trans women, but many of these representations did not enhance the visibility of trans women as actors because the roles were played by cis women or men. These portrayals included Felicity Huffman in *TransAmerica* (2005), Jared Leto in *Dallas Buyers Club* (2013), Eddie Redmayne in *The Danish Girl* (2015), Rebecca Romijn as a recurring character in *Ugly Betty* (2006–2010), and Jeffrey Tambor as the lead character in *Transparent* (2014–2019). However, *Transparent,* which was created, written, and produced by nonbinary director Joey Soloway, did include many trans women in front of and behind the camera, including Billings.

Other recent television shows have also featured trans women playing trans women characters. In addition to Laverne Cox in *Orange Is the New Black,* Nicole Maines was added as a superhero to *Supergirl* in 2018, and many trans women of color appear in *Pose* (2018–), including actors Indya Moore, MJ Rodriquez, Dominique Jackson, Angelica Ross, and Hailie Sahar. A number of recent movies have likewise cast trans women as trans women, most notably Michelle Hendley in *Boy Meets Girl* (2014), Kitana Kiki Rodriguez and Mya Taylor in *Tangerine* (2015), and Daniela Vega in *A Fantastic Woman* (2017). A few highly acclaimed documentaries have also centered on trans women, including *Cruel and Unusual* (2006), which looks at the experiences of trans women in the U.S. prison system; *Call Her Ganda* (2018), which examines the murder of Filipina trans woman Jennifer Laude by a U.S. Marine stationed in the Philippines; and a profile of trans activist and whistleblower Chelsea Manning, *XY Chelsea* (2019).

Trans Women in Public Office

The election of trans women to office has also enhanced awareness and helped advance trans rights. In the United States, dozens of trans women have been elected to public office in the 2000s, including Danica Roem, the first openly trans person to be elected to and take a seat in a state legislature when she was elected to the Virginia House of Delegates in 2017. In the same series of elections, Andrea Jenkins became the first openly trans African American woman elected to office when she won a seat on the Minneapolis City Council. In 2020, Sarah McBride was elected to the Delaware state senate, becoming the first openly trans person to serve as a state senator. Trans women have also been elected to office in Canada, Europe, Latin America, Asia, and the Pacific Islands, including Georgina Beyer, who became the world's first openly trans mayor in 1995 and the world's first openly trans member of a national parliament in 1999. Beyer, a former sex worker, helped persuade New Zealand's parliament to enact the Prostitution Reform Act of 2003, which decriminalized sex work in the country. As more trans women are elected to public office around the world, legislation is more likely to be introduced and enacted that addresses the pervasiveness of discrimination, harassment, and violence against trans people, especially trans women.

Trans Women of Color Collective

The Trans Women of Color Collective (TWOCC) is a grassroots organization that was founded in 2013 to focus on the experiences of trans women of color in the United States and globally. It was the first—and, as of 2020, continues to be the only—national organization in the United States run by and for trans women of color. TWOCC has been instrumental in not only raising societal awareness of the lives of trans women of color but also in improving their lives through initiatives that address their health, well-being, and community connections.

Origins

The Trans Women of Color Collective was started by Lourdes Ashley Hunter, a Black, disabled, trans woman, and Vanessa Victoria, a Puerto Rican trans woman, after the beating death of Islan Nettles, a 21-year-old Black trans woman in New York City in August 2013. Nettles was attacked by a Black cis man who had been attracted to her until he learned that she was trans; she died 5 days later from head injuries sustained in the assault. For Hunter and Victoria, the murder of Islan Nettles highlighted the disproportionate rate of violence experienced by trans women of color, which was not being covered by the media, much less addressed. They founded TWOCC to call attention to this violence, as well as to the high levels of discrimination against trans women of color. The organization began in the greater New York City area, but it later moved its national office to Washington, D.C. It also has regional offices in the Midwest (St. Louis) and the South (Atlanta). TWOCC is fiscally sponsored by the Washington Peace Center and has a private donor base of over 3,000 individuals and organizations.

Philosophy

TWOCC's approach to organizing is based on Black feminist ideologies that recognize the interconnectedness of various forms of oppression and the belief that Black trans women are inherently valuable. It seeks to dismantle the exploitation of trans women of color through highlighting how the intersections of colonization, anti-Blackness, imperialism, misogyny, and transphobia directly affect their lives. In keeping with its philosophy of centering the narratives of those most affected by global systems of domination, TWOCC's leadership team is composed entirely of trans women of color.

Initiatives

TWOCC seeks to fulfill its mission through four initiatives. The first, the Healing and Restorative Justice Initiative (HRJI), includes various projects that empower individual trans women of color and help build community. These include holding public protests in support of trans women of color; offering writing clinics, cultural arts events, and healing retreats to help trans women of color address the trauma they have experienced from oppression; participating in anthropological research studies; and holding advocacy workshops for trans allies. For example, TWOCC led a "Justice for Islan Nettles" campaign in the New York City area in August 2014, which brought attention to the case against the person who murdered her and provided a space for healing and fellowship among trans women of color and their allies. The group also launched a "#BlackTransRevolution Liberation Tour," in which rallies and healing retreats we held

across the United States, including in Columbus, Ohio; Boston, Massachusetts; Baltimore, Maryland; Charlotte, North Carolina; Pittsburgh, Pennsylvania; and Ferguson, Missouri, where Michael Brown, an 18-year-old Black man, was killed by a white police officer in 2014.

As part of its restorative justice approach, TWOCC has collaborated with governmental and international agencies, such as the New York City Police Department and Department of Homeless Services, the United Nations Office of the High Commissioner on Human Rights, the White House Anti-Violence Task Force, and the Federal Bureau of Prisons, to implement trans-affirming policies and practices. In addition to raising awareness of the lived experiences of trans women of color, the group's Healing and Restorative Justice Initiative fosters kinship through actions that engage with the arts, culture, and media.

TWOCC's other projects also center on improving the lives of trans women of color. Their second initiative, the Black Trans Health Initiative, seeks to raise awareness of the barriers that trans women of color frequently encounter in obtaining health care, such as a lack of health insurance and having less access to safe hormonal therapy. As part of the Black Trans Health Initiative, TWOCC has collaborated with Gilead Sciences, Black Women's Health Imperative, HBO Studios, *National Geographic,* and other organizations and sponsored events such as the Philadelphia Trans Health Conference and online webinars that focus on issues of health and wellness in social justice movements. The Trans Women of Color Collective's third initiative, *The Super Princess Saves the Night* children's book series, produces fictional stories about trans youth of color that affirm and celebrate their identity. The last initiative consists of community funds that provide financial support to trans women of color for their education, wellness, and basic survival.

The Trans Women of Color Collective seeks not only to address the erasure of trans women of color but also to fill this gap by building a global network of successful trans women of color. In this regard, Hunter and Victoria, as TWOCC's founders, serve as leadership role models, demonstrating how trans women of color can thrive, rather than just survive. The supportive atmosphere and affirming space that TWOCC fosters allow trans women of color to move beyond survival strategies, such as passing as cisgender or being stealth. TWOCC illustrates the importance of collective action and kinship formation through cultivating economic and sustainable opportunities for trans women of color within their local communities, organizations, and governments.

Transexual Menace

The Transexual Menace (which used the original spelling of *transsexual* with one "s") was a direct action trans organization founded in 1994 to challenge the erasure of trans people from the what was then the LGB (now LGBTQIA+) movement. The group became known for holding demonstrations to call attention to the killing of trans people and to the media's lack of coverage or biased reporting of these murders. At its height in the late 1990s, the Menace had chapters in 42 U.S. cities. Besides raising awareness of the high rate of violence against trans people, the group helped make the trans movement more visible and more political.

Origins

Despite trans people having been central to the 1969 Stonewall Riots, the 25th anniversary march in New York City in 1994 did not include "transgender" in the name of the event. In response, trans activists, including Phyllis Frye, Sharon Stuart, Denise Norris, and Riki Wilchins, protested the march. For the occasion, Wilchins and graphic designer Montine Jordan designed and printed black "Transexual Menace" T-shirts. The word *Menace* was written in blood-dripping red letters in the style of *The Rocky Horror Picture Show* to mock the "horror" that trans people represented to much of mainstream society and to transphobic lesbians and gay men. The name was a takeoff of the "Lesbian Menace," a group of lesbian feminists who protested the exclusion of lesbians from the feminist movement by taking over a 1970 feminist event wearing lavender-colored "Lesbian Menace" T-shirts.

Although the Menace's protest of Stonewall 25 did not result in much attention from either onlookers or the media, their subsequent demonstration at the *Village Voice* was more noticeable. *The Voice* had run an article in April 1994 by lesbian writer Donna Minkowitz about Brandon Teena, a 21-year-old trans man who had been raped and subsequently killed several months earlier because of his gender identity. Much to the outrage of trans activists, Minkowitz's piece refused to see Teena as trans but instead characterized him as a confused, crossdressing butch lesbian. Several dozen trans people wearing Transexual Menace T-shirts and carrying hand-lettered signs and pictures of Teena protested the newspaper's coverage outside its East Village offices. At a time when few trans people wanted to be out, much less publicly visible, the idea of a large group of trans activists protesting in public was entirely new and politically transformative.

Another early protest by Menace members and allies was at the annual Michigan Womyn's Music Festival, which had forcibly evicted Nancy Jean Burkholder for being trans in 1991 and announced a policy to exclude trans women in the future. Wilchins and Boston activist Janis Walworth organized Camp Trans, an education gathering of trans people and supporters in 1994 across the road from the festival's main gate, and distributed scores of Menace T-shirts, which festival attendees wore inside the event to show their solidarity for the inclusion of trans women.

Demonstrations to Call Attention to the Murders of Trans People

The success of the demonstration at *The Village Voice* led Wilchins and Menace activists Tony Baretto-Neto and Nancy Nangeroni to call for a memorial vigil to be held in May 1995 outside of the Falls City, Nebraska, courthouse where one of Teena's killers was to be sentenced for murdering him and two other individuals. Approximately 40 trans activists, including authors Leslie Feinberg and Kate Bornstein, attended the event, as did filmmaker Kimberly Peirce, who was developing her feature film on Teena's life and death, *Boys Don't Cry.* The activists remained all day, even after a local neo-Nazi group came and started to harass and threaten them. Eventually, local law enforcement officers had to surround the activists to prevent them from being harmed.

The following day, as activists were debriefing about the vigil, they learned that Deborah Forte, a 56-year-old trans woman in Boston, had been violently killed. Coming so quickly on the heels of the Teena vigil, the news of Forte's murder created a sense of despair and anger. More and more trans people were reportedly being killed each year, but their deaths were largely ignored by the mainstream media and by local and national lesbian and gay media outlets and political organizations. When there was coverage, it was inevitably sensationalized, as in the case of Teena's murder.

Wilchins, Baretto-Neto, and Nangeroni decided that the Menace would focus its work on raising awareness of anti-trans violence. The three began to hold vigils at cities around the country where trans people had been murdered, reasoning that a public demonstration by trans people in Menace shirts would force media coverage and thereby bring public attention to the epidemic of violence, especially against trans women of color.

Among the trans people whom the group protested on behalf of were Deborah Forte, Christian Paige, and Chanelle Pickett. The vigils also led to the establishment of Menace chapters, as local trans people emerged as "out" activists, organizing their own groups to move beyond the vigils to

protest the many injustices against trans people in their own communities. Wilchins supported these efforts by printing and shipping "Transexual Menace" shirts with each chapter's city on it for activists to wear at the demonstration.

Legacy

The Transexual Menace waned by the start of the 2000s, as its lead organizers focused on other projects (Wilchins had founded GenderPAC, Nancy Nangeroni had started Gender Talk Radio, and Baretto-Neto led Transgender Officers Protect and Serve). But the group had achieved its main aim. Predominantly lesbian and gay organizations and some mainstream media outlets began to pay attention to the murders of individual trans people and to the extent of violence against the trans community, and the establishment of the Transgender Day of Remembrance in 1999 ensured that the deaths of trans people would continue to be acknowledged.

In addition, the Menace helped usher in more subtle, but no less important, changes in how the trans community viewed itself. "Transgender" increasingly shifted from being seen as an issue of personal acceptance to a valid civil rights issue. The Menace also helped move the emphasis from acceptance by cis society to protesting its many injustices. Perhaps most important, it showed that trans people could put aside longstanding beliefs in the importance of "passing" in favor of being "out, loud, and proud."

Transgender as a Term

Considering *transgender* as a term is complicated given that its history weaves through medical, activist, and academic realms while also being adjusted or rejected altogether depending on one's race, class, ethnicity, culture, or geographic context. As of 2020, *transgender* typically operates as an umbrella term that describes someone whose gender identity does not align with the sex they were assigned at birth, based on societal norms. Use of *transgender* tends to center on identity and community, although this was not always how the term was conceived of or used, especially by the medical establishment. While simply descriptive and/or empowering to many white, middle-class, trans people, Western academics, and activists, there are concerns about *transgender* as an umbrella term erasing the intersectional aspects of identity and community for people who inhabit a variety of other social locations. Criticisms of *transgender* have come from a variety of stakeholders with complex relationships to the term and its usage both in the past and present.

The Structure of the Term

Transgender is a combination of the prefix *trans-* (meaning "across," "on the other side of," "beyond," or "through") being paired with *gender.* Based on this, "transgender" people are those who have "crossed" gender lines in some way (e.g., someone who was assigned female at birth and does not identify as a woman might be considered, or might identify as, "transgender"). This is in opposition to *cisgender,* whereby *cis* means "same" or "on the same side of." Cisgender individuals have a gender identity that aligns with the sex they were assigned at birth, according to normative gender assumptions in society (e.g., in most societies and cultures, someone who was assigned female at birth and identifies as a woman would be cisgender). *Transgender* has been used as both an adjective and a noun. While appropriately and most commonly used as an adjective (e.g., "a transgender person"), offensive usage as a noun also occurs (e.g., "a transgender"). Importantly, *transgender* only references gender identity and should not be confused with sexuality; trans people have both a gender identity and a sexuality, just as cisgender people do.

Early Medical Use of *Transgender*

Although the history of *transgender* as a term is difficult to pinpoint, it seems to have had its initial iterations in the medical community in the 1960s. Prior, terms such as *transgenderism* and *transgenderist* were used alongside *transsexual* and *transvestite* by the medical establishment. In the 1960s, the medical community used *transsexual* to refer to an individual who was seeking gender affirmation surgery, while *transvestite* was used to refer to someone who crossdressed. In the 1970s, *transgender* began to be used alongside, or as a replacement for, *transgenderism* and *transgenderist* in the medical field, which is when the term began to be used more commonly by the lay public as well. At that time, *transgender* first emerged as an umbrella term that included anyone who crossed normative gender lines in any way. However, noted older medicalized terms such as *transsexual* and *transvestite* did not leave the gender lexicon and were still commonly used into the late 1970s and 1980s.

The Virginia Prince Controversy

Although most academic texts have been relatively clear about the medical origins of *transgender* and how it was revised and adopted by trans people, communities, and activists over time, a notable historical development of the term remains questioned. According to K. J. Rawson and Cristan Williams, Virginia Prince claims to have referred to herself as "transgenderal" in 1969. A decade later, she used the term *transgenderist* to refer to people who lived as the "opposite sex" without a desire for surgical procedures; this linguistic move was made to distinguish herself from people who were labeled "transsexuals." By the 1980s, people began more regularly using *transgender* as an umbrella term to refer to anyone who shifted away from their sex assigned at birth, and this grew into more widespread usage in the 1990s and 2000s. Prince, however, was adamant that she had coined *transgender* (presumably as it was a part of the other terms she was using), that it refers to a very specific group of people (those who did not desire any gender affirmation surgery), and that is not an umbrella term that includes all people who move across or against the binary gender structure.

Activism in the 1990s and Current Uses of *Transgender*

Despite Prince's objections, many trans people, academics, and activists have consistently used *transgender* as an umbrella term since the 1990s. In 1992, Leslie Feinberg published a pamphlet, *Transgender Liberation: A Movement Whose Time Has Come*. Feinberg's discussion of *transgender* in that document outlines a need for a term that includes everyone who experiences gender oppression of some kind. Feinberg argues that we cannot fight oppression without pride and that self-definition using *transgender* is a way to use language in order to connect people and encourage community pride. With a recognition that the term would not work for everyone and would always be imperfect, Feinberg promoted the use of *transgender* with the premise that it would help trans people form an alliance and reduce social and political oppression. In this way, *transgender* became tied to social justice work and progressive gender politics in the 1990s. A number of activist groups began using the umbrella term of *transgender* due to the publicity of its political use. For example, Transgender Nation was formed as a specific trans interest group, working to eradicate the oppression of trans people. Other organizations that focused on gay and lesbian politics and activism started including *transgender* as part of their name or in their mission statement (although including *transgender* does not necessarily mean the organization is fully inclusive of trans people). Feinberg's activism and the subsequent use of *transgender* by activist groups had a dramatic impact on the term's acceptance.

As of 2020, *transgender* is still used as an umbrella term to refer to anyone whose gender identity does not normatively align with the sex they were assigned at birth. While used in this descriptive umbrella manner, it is also used as a gender identity itself, with many people identifying as "transgender" or "trans," with some individuals adding additional terms after using *transgender* as an adjective (e.g., trans[gender] man, or trans[gender] woman).

Additionally, *transgender* is a term that is applied to community, activism, health care, and politics. For example, people often speak of the transgender community, transgender activism, transgender health care, and transgender politics. That said, *transgender* is somewhat falling

out of favor in some realms, and many people use *trans* for these nonperson entities or issues, similar to how people often use *trans* to refer to identity. Of note, the medical establishment has largely moved to using *transgender* instead of the more antiquated terms noted previously. This is a direct result of trans activism that pushed *transgender* to be the generally accepted appropriate term.

Who Counts as "Transgender"?

One primary issue with *transgender* is that there are people who are either brought under the umbrella without wanting to be there or are left out when they wish to be included. For example, some argue that those who are cisgender but who do drag or crossdress should not be included under the trans umbrella. Others argue that the term means "across gender" and that those who do drag or crossdress are doing exactly that, despite the fact that the moving "across" is temporary. In addition, those who occupy gendered positions that are not in direct relation to the Western gender binary (e.g., *hijra*, two-spirit, *travesti*) may not feel an affinity to *transgender,* although these gender identities and cultural positions are oftentimes included under the umbrella. In addition, including people under a Western umbrella when they do not wish to be included may be considered a colonizing act, as *transgender* largely came from white people in a Eurocentric context. This is difficult to rectify, because policing who gets to count is a problem in and of itself, regardless of whether that is about inclusion or exclusion. Furthermore, *transgender* can eclipse the nuances of trans identities that are specifically tied to race, class, ethnicity, geography, and culture.

Exclusionary policing around who can claim "transgender" as an identity or use it to describe themselves has sometimes come through the rhetoric of whether or not someone is "trans enough." In other words, a person might be questioned about whether they are *really* trans, which is often decided by exclusionary members of some trans communities based on markers of social or medical transition. Although *transgender* is currently the most widely accepted umbrella term that is generally intended to be the most inclusive, some policing continues regarding who can claim it.

Criticisms, Challenges, and Ongoing Discussions

While *transgender* has had significant and normalized usage in the past few decades, one notable shift has been with a preference by many to simply use *trans* instead. This abbreviated term is seen to be more inclusive of a wider range of identities, as some people view *transgender* as referring only to those individuals who shift from their sex assigned at birth into another binary category. In other words, some interpret *transgender* to essentially mean *transsexual.* Viewed in this way, *transgender* leaves out people who may identify as genderqueer, nonbinary, gender nonconforming, androgynous, or any number of other genders that do not fit neatly into the gender binary or challenge it. The term may also not resonate with those who do not wish to seek gender affirmation surgeries or hormone replacement therapies. That said, many people *do* use *transgender* to mean the same thing as *trans*—as a term that arguably includes everyone who is not cisgender. Therefore, conflicts about the use of *trans* over *transgender* are fairly common in academic, activist, and community realms, often with the claim that those who choose to use *transgender* are less inclusive than those who use *trans.* This is similar to claims that those who use *trans* are less inclusive than those who use *trans**.

Transgender is laden with identity politics, and challenges to the term come from a variety of constituents and communities. For example, *transgender* may not be used by people in some older generations or from certain racial and ethnic backgrounds; other terms may be used that refer to someone who crosses gender lines or does not completely identify with the sex they were assigned at birth (e.g., aggressive, butch, two-spirit). Although younger individuals may prefer *transgender* or *trans,* some people from older generations may be more used to using *transsexual,* depending on the time period in which they grew up and/or began identifying as a gender that does not normatively align with the sex they were assigned at birth, since language and commonly used terms have changed over time.

Transgender Day of Remembrance

The Transgender Day of Remembrance (TDOR) is an annual event begun in 1999 and held on November 20 to honor those lost at the hands of anti-trans violence. The event was the first internationally recognized event focusing on trans people, and over two decades, it has helped to lay the groundwork for worldwide activism surrounding trans lives. The TDOR has also highlighted the fact that the preponderance of anti-trans murder victims are Black, women, and poor.

History

The TDOR was an outgrowth of "Remembering Our Dead," a website with information about people who had been murdered because of their gender identity or expression, developed by Gwendolyn Ann Smith following the killing of Rita Hester, a 34-year-old Black trans woman. Hester was murdered in Allston, Massachusetts, on November 28, 1998, three years after another Black trans woman, 23-year-old Chanelle Pickett, was killed in nearby Watertown, Massachusetts. The trial of Pickett's murderer had ended just 15 months before Hester's murder, and although the two cases were not directly linked, the fact that both involved a brutal attack on a young Black trans woman, where the killer was never apprehended (in Hester's case) or received a light sentence (in Pickett's case), caught the attention of Smith. She created Remembering Our Dead to address the lack of trans community memory surrounding violence and murder. The website initially profiled 30 trans individuals, but this number immediately grew, as others began to share news about the deaths of additional trans people.

The TDOR also has its roots in a 1999 demonstration in San Francisco that called attention to the high rate of violence against trans people. Members and supporters of the now-defunct trans rights organization TG RAGE stood outside a theater that was showing *The Brandon Teena Story,* a documentary about Teena's life and murder, with signs that had the names and dates of death of anti-trans murder victims. The success of this action led Smith and a Massachusetts trans woman, Penni Ashe Matz, to organize a protest to coincide with the first anniversary of Hester's murder. This first Transgender Day of Remembrance was held in Boston and San Francisco. The following year, 16 cities across the United States held events, and the number of locations continued to grow in subsequent years. Today, it is commemorated worldwide in hundreds of communities.

During its first few years, the TDOR was held on the anniversary of Hester's death, November 28, but it was moved to November 20, the anniversary of Pickett's death, so as not to interfere with U.S. Thanksgiving events. Also, while initially called just the "Day of Remembrance," the word *Transgender* was added in 2002, so that the event would not be confused with commemorations for the victims of the September 11, 2001, terror attacks in the United States.

Format and Content

The TDOR does not have a set format, allowing local organizers flexibility in designing an event that will best fit their community. Common types of commemorations include candlelight vigils, marches, screenings of trans-related films, and educational events designed to raise awareness of anti-trans violence. Some governments also honor the day, such as by illuminating public structures

in the colors of the trans flag, flying the flag on public buildings, or presenting a proclamation. The majority of events include attendees reading aloud the names of those murdered.

The only expectations for the TDOR are that it not be made "commercial" or turned into a "celebration." The latter restriction has resulted in disputes, as some organizers want the event to send a more uplifting message. This conflict ultimately led to the creation of the International Transgender Day of Visibility, which is held every March 31. Another debated issue is the inclusion of trans people who killed themselves. The event does not typically include suicide victims, so as to remain focused on those murdered due to being perceived as trans.

Because the event is about individuals killed because they are thought to be trans, some of those who are remembered did not actually identify as trans or were not at a point in their lives when they were killed that they identified as trans. Thus, the TDOR includes young children who were murdered because a family member or caregiver viewed them as not appropriately fitting into a given gender and people like Willie Houston of Nashville, Tennessee. He did not identify as trans, but his murderer assumed that he was because he was carrying his fiancée's purse and walking arm in arm with a blind male friend, whom he was escorting to a restroom.

Impact

Although trans activism did not start with the Transgender Day of Remembrance, it became the first event centered on trans issues to be marked nationwide and then worldwide. To date, the day has been commemorated on every continent except Antarctica. The TDOR has also brought much-needed attention to the horrific rate of anti-trans violence, with such murders reportedly occurring worldwide roughly every 18 hours and, in the United States, approximately every 2 weeks.

Another important effect of the TDOR is showing that anti-trans violence is intersectional, with most victims in the United States being Black and Latinx trans women. It also helped uncover the especially high murder rates in many Central and South American countries. Unfortunately, while the TDOR has raised awareness, it has not helped curb the violence. In the United States, the rate of known anti-trans murders remained static for much of the past decade but actually rose in the first 3 years of the Trump administration.

It is important to note that the information about anti-trans murders is limited. For the early years of the TDOR, murders were often not reported in the media or were not characterized as anti-trans hate crimes. While coverage has improved, in large part due to greater trans activism, many parts of the world still ignore violence against trans people. For example, anti-trans murders have rarely been reported in China, Russia, and many African countries because of the lack of human rights monitors and a free press. In some instances, the death of a trans person may be viewed as "un-newsworthy" or as outside of the public interest. This can be further compounded by racism, misogyny, and anti-sex worker sentiment.

Transgender Law Center

The Transgender Law Center (TLC) is the largest trans-led organization in the United States advocating for trans rights and the self-determination of all people. Grounded in legal expertise and committed to racial justice, TLC employs a variety of community-driven strategies to support trans

and gender-nonconforming people in all facets of their lives. It has won precedent-setting legal victories in areas including employment, prison conditions, education, immigration, and health care. In addition, the group's organizing and movement-building programs have assisted, informed, and empowered trans individuals and communities throughout the country, which has further contributed to the rights and agency of trans people.

Early Years

TLC was cofounded by Chris Daley and Dylan Vade in 2002 as a California-focused, fiscally sponsored project of the National Center for Lesbian Rights. TLC's first office, which was located in San Francisco at the LGBT Community Center, provided legal services, policy advocacy, and community education. The following year, TLC became an independent organization and seated its first board of directors; in 2004, it formally incorporated as a nonprofit.

The group's early advocacy focused on public accommodations, employment, housing, and health care through the Safe Bathroom Access Campaign (SBAC) and the California Endowment's Health Care Access Project. TLC successfully advocated for the passage of California's groundbreaking Gender Non-Discrimination Act of 2003 and created know-your-rights resources to help trans people understand the new law. TLC began piloting Transgender Health Law 101 workshops in 2004, and in an early victory, it won approval from an administrative law judge for a client to have their top surgery covered by Medi-Cal, California's Medicaid program. Through the SBAC, TLC released the popular "Peeing in Peace" bathroom guide in 2005 and launched Project Health the next year to help community health clinics in Alameda, Contra Costa, and Los Angeles counties provide trans-competent care. In addition, TLC released the groundbreaking report *Good Jobs NOW!,* a survey of the economic health of trans people in San Francisco, in 2006 in collaboration with the *San Francisco Bay Guardian*.

Cecilia Chung, a prominent trans advocate, joined TLC as deputy director in 2005, which enabled the organization to take on issues and cases that would have a national impact. This expanded scope included testifying before the National Prison Rape Elimination Commission on the federal Prison Rape Elimination Act and overturning a Bush administration immigration policy that denied rights to married binational couples if one spouse was trans.

Growth

After Masen Davis became its executive director in 2007, the organization expanded its work across California and opened a Los Angeles office. TLC took a leadership role in building a consensus in the LGBTQ community in favor of including gender identity protection in the Employment Non-Discrimination Act (ENDA) and organized a 24-hour vigil in front of House Speaker Nancy Pelosi's office. In 2008, TLC established a statewide Leadership Summit and conducted the California Transgender Economic Health Survey. In 2009, TLC formalized the organization's strategic shift to California-based work and won *Somers v. Superior Court*, a case that affirmed the right of trans people living outside of the state to change California birth certificates.

In 2012, TLC won the landmark Mia Macy case, a key moment in the organization's decision to focus on impact litigation. In *Macy v. Holder*, the Equal Employment Opportunity Commission (EEOC) ruled that discrimination against trans employees in hiring and firing was prohibited under federal sex discrimination law, Title VII. TLC's victory in another case 3 years later expanded on that ruling, making it illegal for employers to intentionally misgender their employees and deny them access to the gendered restroom consistent with their gender identity.

A National Organization With a Racial Justice Focus

As it became national in scope, TLC recognized the need to center racial justice in its work and internal culture. Kris Hayashi, former codirector of the Audre Lorde Project, joined TLC as its deputy director in 2013 and became its executive director in 2015. He was the first trans person of color to lead a large, national civil rights organization. Between 2014 and 2020, TLC more than doubled in size and shifted from a majority white organization focused on impact litigation, leadership development, and eradicating discrimination to a majority trans people of color organization that united legal advocacy and movement building to further trans liberation.

TLC closed its Los Angeles office in 2013 and phased out the California Leadership Summit in 2014, holding in its place a national meeting of 100 trans leaders at the Color of Violence Conference in 2015. TLC also opened an Atlanta office in 2015 with the launch of the TLC@SONG program, a collaboration with Southerners on New Ground (SONG). TLC@SONG was the first of several new innovative movement-building programs begun by TLC in the 2010s. Cecilia Chung launched Positively Trans, a program by and for trans people of color living with HIV, with a national needs assessment and advisory board in 2015. TRUTH, a trans youth storytelling and leadership program, also started in 2015 in collaboration with the GSA Network. In the late 2010s, TLC began several groundbreaking projects, including the Black LGBTQIA+ Migrant Project (BLMP), Black Trans Circles, and the Disability Project.

This growth in programmatic work buttressed significant legal victories and marked a shift toward a model of working in partnership with community organizers. Precedent-setting victories included rulings affirming the rights of trans women in prison to access transition-related medical care and the right of a trans high school student to use school bathrooms in keeping with his gender identity. Ongoing litigation includes a class-action lawsuit against the Colorado Department of Corrections for the mistreatment of trans women in their custody and a case against the U.S. government and private immigration detention facilities for the death of Roxsana Hernandez, a trans woman from Honduras who died in federal immigration custody.

In response to the introduction of anti-trans legislation in state legislatures across the country in 2016, TLC launched a National Training Institute to assist local and state-based trans leaders. It also formed a diverse national coalition of trans leaders to improve collaboration and build a cohesive vision for trans liberation. These efforts culminated in 2020 with the Trans Agenda for Liberation, a five-pillar blueprint for legal, policy, and cultural change.

Transmisogynoir

Whereas the term *transmisogyny* labels the oppression of trans women through the intersections of transphobia and misogyny, the term *transmisogynoir* adds another variable—race—to delineate the intersections between transphobia, misogyny, and racism. Transmisogynoir serves as a way to understand the violence, prejudice, and oppression that specifically target Black trans women and transfeminine people, as well as why they experience higher rates of individual and institutional discrimination and more negative health and welfare outcomes overall than other population groups.

In transmisogynoir, prejudice against trans women and transfeminine individuals is further compounded by racial prejudice against people of color in general and Black people specifically. The label, adapted from the word *misogynoir,* applies to acts of misogyny against Black trans women that invoke both race and gender bias, which inflame and complicate each other. Acts of transmisogynoir are predicated upon the idea that Black trans women should be targeted as lesser or Other for, simultaneously, not conforming to bigoted perceptions of a biological gender binary, existing

outside of cisnormative understandings of what constitutes a "real" woman, and belonging to a race other than the white identity perceived to be the U.S. default. If misogynoir explains what queer Black feminist scholar Moya Bailey (2013) called "the particular fuckery that Black women face in popular culture," then transmisogynoir describes the exponentially more complicated fuckery faced by Black trans women.

In a society in which all gender-nonconforming people can be targets of institutional and public vitriol and hate, trans women and transfeminine individuals are especially vulnerable to physical and verbal violence because they are women and more often read as trans than trans men and transmasculine people. And among trans women and transfeminine people, those who are of color are even more likely to face harassment and discrimination. The need for the term *transmisogynoir* stems from the long history of social, physical, and mental violence and other forms of abuse endured by trans women of color, particularly by Black trans women. Transmisogynoir highlights the way that implicit and explicit biases tied to different aspects of their identities not only increase the discrimination they face but also multiply it exponentially, as transphobia, misogyny, and racism all act to inflame the negative stereotypes and treatment of Black trans women. Although transmisogynoir has occasionally been applied to the prejudiced experiences of trans women and transfeminine people of color generally, it most often appears in reference to the specific lived experiences of Black trans women and transfeminine people.

The 2015 U.S. Transgender Survey provides copious evidence of transmisogynoir. For example, 38% of the Black trans women who were surveyed reported having been verbally harassed in public by strangers in the previous year, and 9% reported being physically attacked, compared with 34% and 6%, respectively, of the white trans women. Trans women of color were nearly four times as likely as white trans women to report having been attacked by a gun, with 11% of Black trans women indicating a gun-related assault. Transmisogynoir appears not only in trends of physical and verbal violence perpetuated against Black trans women but also in the social stereotypes others hold about them. For example, 15% of Black trans women had experienced a police officer assuming they were a sex worker. And Black trans women face higher rates of poverty, homelessness, and HIV than the U.S. population overall. In 2019, a year that included the murders of at least 26 trans people in the United States because of their gender identity or expression, the American Medical Association called the country's wave of trans violence an "epidemic." This epidemic affects trans women of color disproportionately: Most of the 2019 deaths, as in previous years, were of trans women of color. According to the Human Rights Campaign, more than three fourths of the 26 anti-trans homicides in 2018 resulted in the death of a trans woman of color. Furthermore, the number of such murders may be an undercount, due to homicides not being covered by the media, misreported victim identities, and a host of other factors.

Transmisogynoir is enacted and made visible by a variety of institutions, including judicial, prison, and educational systems, as well as popular and news media depictions of trans women of color. Moreover, Black trans women experience this oppression from communities that share aspects of their identities, including feminists, other Black and queer people, and even members of Black queer communities that have not escaped the influence of centuries of subjugation by a white patriarchal system. The combination of identity-based historical oppression faced by Black women of color can be traced to critical historical influences, such as slavery, colonialism, and centuries of symbolic annihilation in popular culture. For example, Black trans women are rarely represented in news and entertainment media, and when they are, they regularly appear as victims of murder and other crimes or as the butts of crass jokes. This type of representation does little to humanize a population that is critically vulnerable to numerous forms of institutionalized violence and abuse. At the same time, some trans advocates believe that the increased visibility of trans people of color in media in recent years may have made the population a greater target for violence and vitriol. *Orange Is the New Black* star Laverne Cox, a Black trans woman, has spoken out against a history of street harassment in which she has frequently been the target of transmisogynoir.

Finally, it is important to note that transmisogynoir describes a specific intersection between three identity characteristics and systemic oppression,

but it does not include all aspects of identity. The lived experiences, including harassment and violence, of Black trans women are additionally affected by other elements of their identities, including class, (dis)ability, and religion.

Transmisogyny

The term *transmisogyny* (also written *trans-misogyny*) was coined by Julia Serano in the mid-2000s as an intervention in discussions about anti-transgender prejudice. At the time, such prejudice was generally conceptualized in terms of transphobia, which targets people for their failure to conform to gender norms. Serano pointed out how, in a male-centric culture, gender transgressions toward the female or feminine—as typically occur in assigned-male-at-birth (AMAB) trans people—tend to garner more public sensationalization, consternation, and demonization than their trans male/masculine counterparts. Transmisogyny (a portmanteau of *transphobia* and *misogyny*) was intended to better capture this disparity.

Transmisogyny and the “Lesser Sex”

A rudimentary understanding of transmisogyny follows from the fact that women have historically been viewed as inferior to men in Western, North American culture, and therefore people tend to view AMAB individuals who express a desire to be female or feminine as more perplexing or pathological than assigned-female-at-birth (AFAB) individuals who desire to be male or masculine. This premise is supported by research showing that feminine AMAB children are viewed far more negatively and are brought in for psychotherapy more often than masculine AFAB children. Furthermore, throughout the mid-to-late 20th century, trans-related psychiatric studies, diagnoses, theories, and therapies were centered on “effeminate” boys and men, AMAB crossdressers, and trans women—Serano called this tendency *effemimania* (an obsession with “male femininity”). During this same time period, the media exhibited a similar effemimanic focus, often depicting these same AMAB groups as either potential threats (e.g., predators, murderers) or objects of ridicule (e.g., cliché jokes about men who dress or behave femininely or want their “penis cut off”). The pervasiveness of these stereotypes, and the fact that they were constantly reproduced by media creators who were not personally familiar with trans people, indicates that they were primarily rooted in sexist presumptions about women and men.

Transmisogyny, Femininity, and Artificiality

Transmisogyny also relies heavily on sexist presumptions about gender expression. In our culture, femininity is marked relative to masculinity, with the former garnering far more attention and scrutiny. Furthermore, feminine dress and behaviors are often interpreted as “frivolous” and “artificial,” whereas their masculine counterparts are taken for granted as “serious” and “natural” (as evident in the notion that women get “all dolled up” while men simply partake in “grooming”).

Given these disparities, it is not surprising that those who wish to portray trans people as "fake" women and men will be inclined to dwell on trans female/feminine individuals. In her aforementioned analysis of media depictions, Serano showed that, even though trans women vary in how femininely they dress and act (just as cisgender women vary in these ways), they are almost always portrayed in a hyperfeminine manner, and feminine accoutrement (e.g., displays of putting on clothing or cosmetics, slipping while wearing high heels) is regularly employed as a device to emphasize their supposed "fakeness." In contrast, because masculine dress and mannerisms are viewed as "natural" and "practical," it is more difficult to depict trans male/masculine individuals as putting on an "artificial exterior"—this may contribute to the media's relative disinterest in such individuals (i.e., trans male/masculine invisibility).

Transmisogyny and Sexualization

Sexualization may be the most blatant manifestation of transmisogyny. Trans female/feminine individuals are routinely depicted in sexually provocative and objectifying ways and often have sexual motives attributed to them. Historically, the two most common stereotypes of trans women have been the "sexual deceiver" (i.e., "men" who "impersonate" women in order to "trick" or "trap" straight men into having sex) and trans women who do not "pass" as female but transition anyway in order to fulfill some personal sexual fantasy. Serano has chronicled the proliferation of these two stereotypes in media depictions and psychiatric discourses alike, noting how they both center hetero-male sexual desire. In stark contrast, sexual motives are rarely projected onto trans men; in fact, the most common lay theory to explain trans male/masculine individuals is that they must be attempting to attain male privilege and status. Thus, the popular assumptions that trans men transition in order to become men, but that trans women must be doing it for sexual reasons, implies that women as a whole have no worth beyond their ability to be sexualized.

Interpretations and Critiques of Transmisogyny

As the term has caught on, *transmisogyny* has increasingly been used as shorthand for any prejudice expressed toward trans women, regardless of content. However, while trans women are certainly targets of transmisogyny, any person who is perceived as, or presumed to be, a feminine or feminized "male" may be subjected to these same derogatory, pathologizing, and sexualizing attitudes (albeit to varying extents).

Some have critiqued transmisogyny for downplaying the role that misogyny plays in policing trans male/masculine identities. While said misogyny undoubtedly occurs, it may take on different forms—for example, a trans man may be perceived as, and ridiculed for, being a feminine man (which undoubtedly falls under the umbrella of transmisogyny described here), or alternatively, he may be invalidated as a "woman pretending to be a man" (which comes with a very different set of sexist assumptions and social meanings); see Serano's distinction between *traditional sexism* and *oppositional sexism* for further discussion.

While transmisogyny strives to describe the interplay of transphobia and misogyny that many trans female/feminine people experience, the concept has been criticized for potentially excluding or erasing other forms of marginalization. As but one example, victims of transphobic violence are disproportionately trans women of color; if one were to cite this as an example of "transmisogyny," it would render invisible the critical role that racism plays in this phenomenon. Others have forwarded new terms (e.g., transmisogynoir) to expand upon or reframe the intersection of these various forms of marginalization. Thus, rather than view transmisogyny as a "single issue" unto itself, it should be recognized as a broad category of sexist attitudes and sentiments that intersect with other social forces and that may play out in various ways in different individuals' lives.

Transnormativity

Transnormativity is a regulatory, normative ideology that holds trans people's experiences and identities accountable to a binary, medical framework. In other words, the legitimacy of trans people's identities is socially evaluated, and trans individuals are rewarded or sanctioned based on how closely their experience aligns with these normative standards. As such, transnormativity has a noteworthy impact on the lived experience of trans people in intrapsychic, social, and cultural domains. This entry provides a brief conceptual overview of transnormativity, discusses its empirical applications in studies since 2016 of dominant themes and narratives, and suggests directions for future research.

Conceptual Overview

A noteworthy body of academic literature has called attention to how normative understandings of sex and gender, characterized by binary essentialism, have permeated medical, academic, and legal discourse and are enacted through institutional and interpersonal accountability or gatekeeping practices. For instance, early trans care clinics in the mid-20th century often required trans women (trans men were infrequently considered at this time) to perform stereotypical European femininity, profess a heterosexual sexual orientation, and narrate their identities as some variant of being "born in the wrong body" in order to access gender-affirmative medical care of any kind. Today, many governments still require proof of *complete* and *irreversible* surgical medical intervention that medically changes a person's sexed body before they will grant court orders for legal gender marker changes. In reality, trans people report a wide range of gender identities, sexual orientations, and transition trajectories. However, these normative standards (e.g., traditional gender expression, binary gender identity of male or female, and "complete" linear medical transition involving hormones and surgeries) have remained a metric by which the legitimacy of trans identities are measured across social contexts and institutions, from health care and the criminal justice system to education and the family.

In an attempt to synthesize these normative standards into an overarching conceptual framework, scholars have invoked the construct of *transnormativity,* defined as a regulatory, normative ideology that holds trans people's identities accountable to a medicalized, binary framework. In a 2019 paper titled "Transnormativity in the Psy Disciplines: Constructing Pathology in the *Diagnostic and Statistical Manual of Mental Disorders* and *Standards of Care,*" Damien Riggs and colleagues identified the history of how transnormativity has been codified and institutionalized within such documents as the fifth edition of the American Psychiatric Association's (APA) *Diagnostic and Statistical Manual of Mental Disorders* (*DSM-5*) and the World Professional Association for Transgender Health's (WPATH) *Standards of Care (SOC) for the Health of Transsexual, Trans, and Gender-Nonconforming People, Version 7* (SOC-7). In 1980, "Gender Identity Disorder" was listed in the *DSM-III* as a psychological disorder with defined diagnostic criteria. Even with the 2013 change in *DSM-5* to "Gender Dysphoria," little has changed in the way psychiatric taxonomies have regarded trans experiences, and these guidelines still arbitrate what constitutes legitimate trans experiences. For example, a psychiatric diagnosis of gender dysphoria is often still required for individuals to pursue gender-affirmative medical interventions, meaning that individuals must narrate their trans identities in a way that sufficiently conforms to the *DSM* criteria in order to access gender-affirmative health care. Likewise, WPATH's SOC is used by most gender-affirmative surgeons to determine eligibility for genital surgery, such as metoidioplasty, phalloplasty, and vaginoplasty. In SOC-7, access to these genital surgeries includes the requirement that patients undergo 12 continuous months of hormone therapy and 12 continuous months of "living in a gender role congruent with their gender identity." Although perhaps well meaning, such standards impose a normative transition trajectory that assumes all trans people seeking genital surgeries must also desire hormone therapy. This narrow medical model of trans identity transcends health care and operates as a normative accountability structure for trans people across social contexts and institutions, including the state and national vital records, the criminal justice system, and trans community groups.

In other words, trans bodies can be "normalized" and assimilated within cis-heteropatriarchy through their approximation of mainstream norms, beliefs, and expectations related to sex and gender. In turn, the legitimacy of trans people's identities is socially evaluated, and trans individuals are rewarded or sanctioned based on how closely their experience aligns with these normative standards. For example, trans people who are nonbinary, or those who do not pursue gender-affirmative medical interventions such as hormone therapy or surgery, may be deemed not "really" trans or not "trans enough" by friends and family, service providers, or even other trans people. On the other hand, trans people who are perceived to have wholly crossed from one side of the gender binary to the other, while upholding normative standards of heterosexuality and physical appearance, may be less socially disruptive, as their gender nonconformity is still "contained" within normative understandings of sex and gender. In this way, transnormativity may be understood as theoretically situated alongside heteronormativity and homonormativity as a regulatory ideology that is both constraining and empowering, dependent on an individual's position relative to normative bodily, behavioral, and narrative standards of trans experience.

Empirical Applications

In a 2016 paper entitled "Transnormativity: A New Concept and Its Validation Through Documentary Film About Transgender Men," Austin H. Johnson conducted a content analysis of documentary film centered on the experience of trans men and identified two prominent themes of transnormativity in the public, educational discourse on trans experience: (1) an adherence to *born in the wrong body* discourse and (2) an emphasis on *the medical model*. These themes suggest, first, a discovery narrative of trans experience wherein transness is etiologically, and essentially, located in the psyche of individuals and must simply emerge from within. Second, these themes suggest that trans experience should be understood within a medicalized framework as requiring hormonal and surgical intervention in order to be successful. Similarly, Joanna McIntyre applies the concept to trans-focused reality television in a 2018 book chapter entitled "'They're So Normal I Can't Stand It': *I Am Jazz*, *I Am Cait*, Transnormativity, and Trans Feminism," finding that transnormativity as an ideological construct also privileges trans men's experiences of gender, eclipsing the experiences of trans women who are unable to conform to social expectations of embodied femininity and objectifying the experiences of trans women who do.

In a 2018 journal article, "On the Limits of 'Trans Enough': Authenticating Trans Identity Narratives," Spencer Garrison interviewed 17 nonbinary and binary trans people to understand the work they do to prepare and present transnormative identity narratives. Garrison found that these two groups employ distinct rhetorical strategies; binary trans participants tended to favor fluid notions of gender identity, while nonbinary participants relied on tropes of gender as a lifelong, unidirectional pull. Garrison explains that nonbinary people experience intense scrutiny, with identities easily rendered invisible or deemed unintelligible, while binary trans people have the freedom to express more complicated identities or expressions that may challenge conventional notions of trans identity. Taken alongside the existing body of literature, this suggests that trans people are acutely aware of transnormativity and the expectations it sets for the identity narratives available to and useful for them across social contexts and institutions. In a 2019 journal article, "Rejecting, Reframing, and Reintroducing: Trans People's Strategic Engagement With the Medicalization of Gender Dysphoria," Austin H. Johnson revealed that trans people recognize the social power of meeting transnormative expectations and strategically shift their identity narratives accordingly.

In a 2019 journal article, "Transnormativity and Transgender Identity Development: A Master Narrative Approach," Nova Bradford and Moin Syed used qualitative focus groups with trans adults in the United States to identify seven aspects of transnormativity that arose in participant discourse. Two prominent themes included medicalization, or the hegemonic expectation that all trans people should seek gender-affirmative medical interventions, and gender binarism, or a preference toward "binary" trans identities (trans man/trans woman). These themes echo the aspects of transnormativity described in previous literature.

However, Bradford and Syed identified additional themes, including *gender roles,* which may be applied unevenly or more strongly to trans people than their cisgender counterparts; *nascence,* the idea that trans people are "born trans" or must develop trans identities very early in life; *victimization,* or the expectation that trans people's lives must inexorably consist of violence and rejection; *gatekeeping,* or structural barriers to accessing health care, resulting from transnormativity; and *legitimacy,* or the role of transnormativity in determining which trans identities are legitimate or "more legitimate" than others.

Future Directions

The existing body of literature on transnormativity has broadly aimed toward theoretical development, such that empirical research exploring the impact of transnormativity on individuals has remained relatively underdeveloped. Researchers have identified the salience of transnormativity in trans people's discourse and social interactions, but the concrete effects of transnormativity on trans people's social and emotional well-being warrant future investigation.

In the past 5 years, there have been promising developments in psychotherapeutic models that subvert transnormativity and affirm the full spectrum of gender experiences. For example, the Gender-Affirmative Lifespan Approach (GALA) centralizes the needs of nonbinary clients by identifying that the experience of stigma and internalization of oppressive beliefs about gender contribute to health disparities facing nonbinary people. Similarly, the Minority Stress Model draws attention to the role of transphobic and cissexist discriminatory and violent acts, their anticipation by trans and gender-diverse people, and the internalization of their meaning by those at risk in the rates of psychological distress and suicidality among trans people. Future researchers must explore the role of transnormativity in the stigmatizing, discriminatory, and violent events in the daily lives of trans people and imagine structural, cultural, and interactional interventions that would interrupt these processes.

Future research should also aim to assess the extent to which transnormativity permeates all health disciplines and structures patient–provider interaction, providers' ability to deliver the highest standard of care to trans and gender diverse people, and trans people's bodily autonomy within health care interactions. Further, future research should be geared toward the development of pedagogical and clinical care models that maximize health and autonomy of people of all genders without ascribing normative standards or value judgments to individual transition trajectories. Likewise, steps have been taken within institutions to depathologize trans identities (e.g., the reclassification and renaming of Gender Dysphoria in the transition between the World Health Organization's *International Classification of Diseases, 10th and 11th Revisions* [*ICD-10* and *ICD-11*] and between the *DSM-IV* and *DSM-5*), and such efforts should be coupled with enabling the greatest possible degree of autonomy and individual choice for trans people accessing health care.

Transparent (TV show)

Debuting in 2014, *Transparent,* an Amazon Original series, was created and directed by Joey Soloway and filmed in the Paramount Studios in Hollywood, California. It received acclaim, notoriety, and criticism during its four full seasons and fifth-season single-episode musical finale. *Transparent* cut its fifth season short after acknowledging sexual harassment allegations against Jeffrey Tambor, the show's protagonist, Maura (née Mort) Pfefferman. While *Transparent* was credited with challenging the dominant cisgender imagination among media portrayals of trans individuals, it was also the focus of scholarly analysis and social praise and opprobrium based upon its narrative, casting decisions, portrayals of trans individuals, explorations of sexualities, and representations of Jewish themes.

Initial Reception and Praise

During its first season, *Transparent* was lauded by trans activists, journalists, and viewers who praised the show's depiction of Maura, an older, overweight trans woman. During the drama's pilot, Jeffrey Tambor was 70 years old, playing a character who had just retired from a long teaching career at the University of California, Los Angeles (UCLA). Thus, the protagonist was older, well educated, and not stereotypically feminine, all of which were praised among viewers and media critics. As the narrative developed, the show was likewise greeted with some degree of resistance as some argued that it was classist, ableist, and reinforced whiteness as culturally dominant.

Content and Themes

The pilot introduced viewers to a nervous father, Mort Pfefferman, fumbling to light candles for the Jewish sabbath on a Friday evening. As his adult children discuss the recent developments of their lives, their interactions suggest that since their parents' divorce in 1994, their father has provided financial and emotional support while encouraging them to develop their relationships with one another. Mort's ex-wife, Shelly (Judith Light), meanwhile appears self-involved, somewhat narcissistic, and distanced from their three adult children. The oldest Pfefferman child, Sarah (Amy Landecker), struggles through marital problems that include her own infidelity with her old college flame, Tammy (Melora Hardin). The family's middle child, Josh (Jay Duplass), becomes increasingly unpredictable and unsuccessful in his career as a music executive while struggling to cope with an affair he had as a child with the family's housekeeper. Meanwhile, the family's youngest adult child, Ali (Gaby Hoffmann), squanders winnings from *The Price Is Right* while experimenting with drugs, returns to college, engages in a romantic relationship with a faculty adviser, and ultimately identifies as a nonbinary individual named Ari. Mort transitions to Maura ("Moppa" to the adult children) and serves as a focal point for the Pfefferman family, yet the show's narrative focused not on her gender transition but on her family's reaction to it.

Trans Representation

In addition to challenging gender stereotypes, the show gained a significant group of followers who appreciated its "transfirmative" action, the intentional hiring of trans writers and actors. Our Lady J, Zackary Drucker, and Rhys Ernst, all trans individuals, contributed as writers, while Alexandra Billings, also trans, appeared as a supporting character throughout all four seasons and the fifth-season finale. Despite this, *Transparent* received criticism over its casting of a cis male (Jeffrey Tambor) in the role of Maura Pfefferman. This disapproval over casting, however, was met with nearly equal approval. Scholarship analyzing the show's portrayal of trans individuals criticized the show's lack of trans men and people with disabilities. While Ian Harvie (a trans man) made a brief appearance, his character was written out of the show after acting in an ambiguous sex scene involving himself, Ali/Ari, and a dildo that dropped

to the floor. Other trans men appeared briefly in support groups as recovering addicts. Despite its underrepresentation of trans men, disabled trans people, and trans individuals of color, *Transparent* developed a following of significant numbers as viewers and critics praised the show's complex narrative, which explored gender, sexuality, and Jewish identity.

Jewish Themes

Adding an extra layer of complexity to the journey of each character's identity discovery, the show explored the Pfeffermans' Jewish heritage, often making parallels between the struggle for social justice for trans individuals and the trauma of World War II on the Jewish psyche. As the storyline developed, the family's Jewish identity moved from the periphery to a more central role. Indeed, Judaism seems a catalyzing force of strength for Maura, who becomes increasingly empowered by her persona as not merely a woman but as a Jewish woman. Scholarship on the show's treatment of Jewish themes praised its unapologetically complex examination of Jewish heritage within contemporary contexts.

The Finale

Transparent had entered a contract for a fifth season with Amazon Studios when multiple trans women colleagues on the show levied sexual harassment allegations against Jeffrey Tambor in the fall of 2017. Following an internal investigation, Amazon Studios decided to terminate its contract with Tambor. To give the narrative closure, Soloway created "Musicale Finale," a feature-length musical conclusion in which it was revealed that Maura had died of a heart attack while sleeping and left her estate to her best friend, Davina (Alexandra Billings), to use for charity. Ultimately, the show's finale was not well received by viewers, as *Transparent* had never before depicted the Pfefferman family breaking into song in choreographed harmony.

Conclusion

Offering viewers a unique opportunity to consider gender not as fixed and individual but as inevitably linked to the past and communal, *Transparent* challenged media stereotyping of trans individuals. In so doing, it was the first streaming television show to win a Golden Globe for Best Series. While *Transparent* made some strides for the advancement of social justice for trans individuals living in the United States, where they suffer systemic injustice in nearly every social realm, its ultimate demise underscored the need for more aggressive gender-expansive and gender-inclusive programming.

Transphobia

Transphobia is defined as an intense antipathy toward people who do not conform to normative gender roles or, more commonly, a fear and disgust of trans people. It is a system of beliefs, values, and

psychological motivations for anti-trans discriminatory behavior and attitudes. Confusingly, it is not really a phobia (not an irrational fear); rather, it is a portmanteau word derived from *homophobia*. Transphobia is often understood to be a part of homophobia, and they often co-occur, but the former applies to anti-trans prejudice (more commonly, transprejudice), and the latter refers to anti-LGBQ discrimination. Transphobia is sometimes equated with genderism or cisgenderism, but transphobia is a psychological bias, and genderism and cisgenderism are sociological and cultural biases—the systemic version of the more interpersonal transphobia. This entry on one of the central concepts of trans studies reviews the origins and use of *transphobia* and its connection to gender, sexuality, racism, religion, and nation.

Origins and Use

Transphobia entered public discourse in the 1990s and quickly developed into a popular area of scholarly inquiry, as social science researchers explore the many factors at work and scholars in the humanities document transphobia in individual lives across the world. *Transphobia* entered the *Oxford English Dictionary* in 2013, and in 2020, online dictionaries and references have extensive entries for transphobia.

Early research focused on exploring the origins of transphobia (i.e., a cultural belief in dichotomous gender some researchers have called *genderism* or *cisgenderism*), how it works socially (i.e., stigma), and how to operationalize and ultimately reduce transphobia using interventions in empirical research. In the social sciences, the main controversy seems to be how to measure transphobia. Measures of transphobia proliferate, each with somewhat of a different focus and, in some cases, different languages; some measures are extensive, including behavioral measures of gender-bashing, whereas others rely on shorter self-report assessments.

In contrast, writers in the humanities document and analyze transphobic comments in popular culture, mostly from public figures such as athletes, social commentators, writers, musicians, and comedians. Trans memoirs, a vibrant genre that had fallen out of favor, have become popular again since the millennium, as writers wrestle with internalized transphobia, the transphobia of their friends, family, and lovers; since 2010, most also talk about a new world of positive and multidimensional trans lives. The most significant development, however, has been the identification and critique of trans exclusionary radical feminists, or TERFs, a group of feminist scholars asserting that trans women are not "real" women. The debate has largely been contained to philosophers in Britain and Australia reacting to proposed legislation that would permit people to self-select their gender. The so-called TERF Wars implicated the major feminist journal *Hypatia* after editors published a paper that compared being trans to being transracial, which was largely seen as harmful and transphobic. Scholars also called for the resignation of the editor of *Disability & Society* and for action to address transphobia in disability studies.

In legal discourse, transphobia is primarily used to argue for ending bias against institutionalized trans people, such as in efforts to establish trans rights in prisons, as well as for ending state control of "sex" on official identification documents. More broadly, transphobia has been used in legal discourse to understand the problematic nature of gender and sex, sexual citizenship, and police violence against trans people. By 2019, legislators in six states had banned the "trans panic" defense, a legal tactic used to defend killers of trans people. Federal courts have repeatedly found that sex discrimination laws such as Title VII and Title IX apply to trans people, giving federal protection against transphobic discrimination. Indeed, in 2020, a momentous U.S. Supreme Court decision ruled that Title VII extended to protect transgender people from employment discrimination.

Research has documented the extensive transphobia among health care providers, and medical discourse deploys transphobia to explain why health care professionals discriminate against trans people: stigmatization, refusing treatment, misgendering, and ignorance about trans medical needs. In response, medical educators are taking up the call to design more trans-inclusive curriculum to reduce transphobia in frontline medical care.

Transphobia, and efforts to reduce it, have been central to educational literature. In the spirit of inclusive and tolerant education, educational institutions—from grade schools to colleges and universities—have been developing policies and procedures to reduce transphobia.

Although transphobia is prohibited by antibullying campaigns, which now incorporate violence against nonnormative gender identities, it is still common in schools.

Regarding the factors that contribute to transphobia and its conceptualization, as of 2020, there is little research on transphobia conceived explicitly from an intersectional perspective. There are studies on the impact of gender, sexuality, race, nation, and religion, but few examine more than one of these factors at a time and so ignore the interactive nature of all these factors in transphobia.

Gender

Gender of the perceiver and gender of the person being perceived are both involved in transphobia. In terms of the perceiver's gender, research has shown that cisgender (cis) men are more transphobic than women. Sexual orientation is an interactive factor, as heterosexual cis men are the most transphobic. In terms of the gender of the person being perceived, trans people who pass (conform to gender expectations) are least affected, and trans women experience more discrimination than trans men. To put it into intersectional terms, hypermasculine cis heterosexual men report more transphobia overall and more toward trans women than trans men. Critics claim that approaching transphobia from a gender binary perspective (e.g., doing research on men's vs. women's transphobia) can feel othering and paradoxical to those who are nonbinary.

In 2020, the Netflix documentary *Disclosure* showed the aforementioned patterns in the transphobia of the television and cinema industry: Although fascinated with the "spectacle" of trans women, movies and TV shows portray them as sex workers and targets of fear and revulsion; in contrast, trans men are much more invisible (not evident in depictions of drag balls), except when they are discovered to be trans, and then are either positioned as women and sexually assaulted or rejected by cis men for being women and rejected by lesbians for being "traitors to womanhood." The documentary concludes that transphobia in the industry will end only when trans lives are portrayed positively and in a way that makes trans characters more than just a trans person.

Sexuality

Sexuality is also an important consideration. Trans people may experience hostility not only from the mainstream heterosexual cis public but also from others in the LGBTQIA+ community. In various studies, trans women report feeling especially dismissed by white gay men, and gay men are more transphobic than lesbian women. Other reports find that trans men may experience antipathy from lesbians, as lesbians are not exempt from perpetuating anti-trans prejudice either, especially white cis lesbian women. Perhaps the best illustration of the connection between sexuality and transphobia was the 2017 panic over trans people in public restrooms and the subsequent unsuccessful legislative actions ("bathroom bills") taken to restrict access to sex-segregated facilities to only cis people due to a fear that trans people might sexually assault cis people in public toilets.

Race

Although writers in the humanities acknowledge the link between racism and transphobia—that trans women of color specifically are the most discriminated against—there are few empirical studies testing this intersectional bias. Research is only beginning to document prejudice as trans people of color go to child custody and immigration hearings and interact with the police, white people, and other people of color. North American researchers tend to have mostly white trans participants in their studies. Research focusing on the impact of race on transphobia, both the race of the perceiver and the trans person, has yet to be conducted. For example, transphobia has been shown to affect health care for both trans people and racial/ethnic minorities, but trans people of color face both racism and transphobia when seeking health care, leading them to be denied health care or avoid seeking help.

Religion

Transphobia is commonly associated with conservative social views, and researchers have found that organized religion and religiosity are factors. Religiosity—frequency of attendance, importance of religion—is usually, although not always, associated with transphobia. Christians in Spain, for example,

who attend church regularly are less transphobic than U.S. Christian conservatives. In general, the more religious a person is, the more transphobic they are, with Muslims reporting more transphobia than Christians. Yet, it is important to attend to regional differences. For example, in Islamic Iran, being a trans woman or trans man is viewed as a medical problem, with a state apparatus to assist with transitioning, but being gay is viewed as the result of willful sin and is punishable by death. One might surmise, then, that there is less transphobia than homophobia in Iran.

Nationality

One of the most significant trends in transphobia scholarship is an expansion beyond Canadian and U.S. scholars. There are scholars studying transphobia in Asia (e.g., China, Laos, Hong Kong, Thailand, and the Philippines), Africa, South America (e.g., Brazil), Australia, and the European Union (e.g., Poland, Portugal, Spain, Italy, and Belgium). Most languages have adopted the English version (e.g., *transphobie* in French and German; *трансфобия* in Russian), as well as conceptualization, but there are some differences among national conceptions of transphobia, and there has been very little work on exploring indigenous notions of transphobia independent of those in the West. Indeed, because of cultural and linguistic histories, the meaning and connotations of the term *transphobia* vary with country and culture.

Transphobia, a key concept in trans studies, has entered discourses in a range of fields and is a central focus of a great deal of theoretical and empirical analysis. Overall, while some writers do consider multiple interacting factors (gender, sexuality, race, religion, and nation) in their studies of transphobia, emphasizing the intersectional nature of anti-trans prejudice, most examine only one variable's impact on transphobia at a time.

Transpinay

Transpinay is a contemporary word to describe Philippine trans women, combing *trans* and *Pinay,* the local term for Filipina, a woman from the Philippines. Previously, Filipinos used the term *bakla* to describe all individuals who were assigned male at birth who had adopted a traditionally feminine gender expression, including trans woman. To this point, relatively few non-trans Filipinos embrace and use the word *transpinay.* Given that the Philippines is a predominantly conservative Christian country, where trans people lack legal rights and where trans women are disproportionately the victims of hate crimes, it is not

surprising that its cis population does not recognize the term *transpinay,* as they do not acknowledge trans people in general.

Precolonial Trans: The Babaylan

The Philippine islands were colonized by Spain from 1521 to 1898. During this time, Catholicism spread across the country and with it the repression and elimination of individuals whose gender identity and expression were different from their assigned sex. Depending on the specific province and dialect, they were called *babaylan, asog, catalonan,* and *bayoguin* and existed in most communities in the Philippines until Spanish colonization. In many cultures, they assumed roles as high priests, shamans, and community leaders and were venerated for their abilities to bless and feared for their abilities to curse. The societal recognition of third genders in the precolonial Philippines is comparable to the more well-known examples of Indonesia's *bissu* people and India's *hijras*.

Precolonial Filipinos were mostly animists and did not ascribe to a gender binary system, which was contrary to the Spanish teachings of Christianity. Nonbelievers were characterized as devil worshippers, and it is believed that many babaylan were persecuted and forced into hiding. They may have continued to exist in small pockets in more remote parts of the archipelago, and some may have publicly presented within the gender binary to avoid persecution. The United States controlled the Philippines following the Spanish-American War in 1898. But while the prevalent cultural and political influence became American, many Spanish legacies, including conservative Christianity, remained. More than three fourths of Filipinos today are Roman Catholic—one of the highest percentages among Asian countries.

Postcolonial Trans: Bakla and Transpinay

After World War II, the word *bakla* began to be used to refer to birth-assigned males who identify and/or express their gender in a variety of traditionally feminine ways. It is believed that the term is a melding of the Filipino words for "female" (*babae*) and "male" (*lalake*). *Bakla* is a lexical and conceptual conflation of gender identity, gender roles, gender expressions, and sexual orientation (as the common assumption is that those with feminine expressions are exclusively attracted to men). The term used in the Philippines to refer to birth-assigned females who identify and express themselves in traditionally masculine ways—*tomboy*—likewise conflates gender and sexuality. The mainstream media's use of the term *bakla* (and, rarely, another term, *binabae*) helped it become well known.

The terms *transvestite* and *transsexual* were rarely heard in the Philippines until the 1980s, when many baklas started working in Japan as entertainers. Most cis Filipinos do not make clear distinctions in terminology, using *bakla* to refer to all gender-nonconforming individuals. To the extent that *transvestite* and *transsexual* are used, the terms are reserved for individuals who are taking hormones and have undergone gender-affirming surgeries.

The bakla experience extensive prejudice and discrimination from the rest of Philippine society, including from the country's Catholic Church, which teaches that they are sinners and a moral abomination. But, at the same time, baklas are tolerated when they perform certain societal roles. They are perceived to be talented entertainers and knowledgeable about aesthetics and designs. For example, most of the hairstylists in beauty parlors are baklas.

Beauty pageants are very popular in the Philippines, and baklas are accepted in this culture. Although the pageants for cis women are more legitimatized, those for trans women are more abundant and regarded as more entertaining. Trans beauty pageants reached their height of popularity in the 1990s, when thousands were held annually. Outside of a few pageant contestants, it has been very rare to see trans celebrities in the media, except for Helen Cruz, then known as Lady Valerie (these celebrities were famous in the 1980s but became notoriously private thereafter). The actor Roderick Paulate, who is most frequently identified with portraying trans roles in movies and on TV, refers to themselves as *bakla* or *binabae*.

LGBTQIA+ and trans-specific activism are relatively recent developments. The country's first officially recognized LGBTQIA+ organization was started at the University of the Philippines in 1992. The group, UP Babaylan, took its name from

legendary precolonial high priests. The 1990s also saw the emergence of an LGBTQIA+ movement, with the first LGBTQIA+ pride march in the Philippines and the formation of the LGBTQIA+ political group, Ang LAdlad Partylist.

The first organization of and for trans women, the Society of Transsexual Women of the Philippines (STRAP), was formed in May 2002. In 2008, STRAP unanimously voted to begin promoting the use of *transpinay* as a term to refer to trans women in order to differentiate them from other baklas and address the conflating of all trans identities by the general public. The term reflects the Philippine trans woman's reclamation of her history and lineage and the embracing of her gender identity. By the 2010s, as more activists and researchers worked with STRAP, the country's media and universities began to use the term and recognize transpinays as a distinct group with their own unique experiences and challenges.

The development of *transpinay* paved the way for Philippine society to acknowledge the extent to which transpinays experience anti-trans discrimination and violence, such as the widely publicized murder of Jennifer Laude, a 26-year-old transpinay, who was killed in 2014 by a visiting U.S. serviceperson. In 2016, Geraldine Roman was elected to the Congress of the Philippines, becoming the first publicly identifying transpinay politician in Southeast Asia. As of 2020, the country's legislature has not passed any laws that recognize or protect transpinays and other trans people. Transpinays are also not acknowledged by the Philippine health care system, and because transitioning is not included in health insurance policies, most transpinays transition without medical supervision.

Trauma, Trans People With

Trans people experience disproportionate levels of trauma and traumatic stress. This entry defines trauma, identifies rates of trauma, and examines the causes, manifestations, and consequences of trauma for trans people. It identifies the historical roots of trauma for trans people in the context of mental and physical health services and defines the conditions that contribute to trauma and traumatic stress, as well as the social and emotional impact.

Defining Trauma

Trauma is commonly understood as experiencing or witnessing an event or events over which one is powerless, that causes or threatens injury, death, or the annihilation of self. Trauma exceeds the bounds of ordinary stressors and causes physiological and psychological responses that can fundamentally affect the brain and the nervous system. Neurophysiological, developmental, and psychological structures designed for survival and well-being respond and change in response to trauma. As a result, people can experience traumatic stress, which can include difficulties physically, cognitively, emotionally, and interpersonally. For trans people, gender identity is an undercurrent through which these symptoms are expressed.

U.S. Transgender Survey (USTS)

In 2015, the National Center for Transgender Equality conducted a nationwide online survey of nearly 28,000 trans adults from all 50 states as well as the U.S. territories of Guam, American Samoa,

and Puerto Rico. The survey represents the largest and most comprehensive look at the lives and complexities of the trans community to date and illuminates the magnitude of trauma experienced across this diverse community. For example:

- Nearly half (46%) of respondents were verbally harassed in the past year because they were transgender.
- Nearly 1 in 10 (9%) respondents were physically attacked in the past year because they were transgender.
- Nearly half (47%) of respondents were sexually assaulted at some point in their lifetime and 1 in 10 (10%) were sexually assaulted in the past year. In communities of color, these numbers are higher: 53% of Black respondents were sexually assaulted in their lifetime, and 13% were sexually assaulted in the past year.
- Seventy-two percent of respondents have done sex work, 65% of respondents have experienced homelessness, and 61% of all respondents reported being sexually assaulted in their lifetime. More than half (54%) of respondents experienced some form of intimate partner violence, including acts involving coercive control and physical harm; 58% reported having been harassed by the police.

Although the level of social and institutional awareness and knowledge of trans people has markedly increased, experiences of trauma remain disproportionately high. The occurrence of trauma, its symptoms, and its outcomes are informed by transphobia, microaggressions, barriers to social and interpersonal connection, and disruptions in the experience and expression of a felt sense of self.

History of Trauma for Trans People

Historically, medical and mental health systems unwittingly played a role in sustaining cisgender identity as a measure of health and wellness. The etiology of trans identity has undergone a transformation from psychosis to significant mental illness to identity diversity. In the course of that evolving etiology, trans people were forced to deal with medical and mental health systems that misunderstood and misrepresented the experience of inhabiting a body that does not match a felt sense of self. On an institutional level, the traumas experienced by trans people have been inappropriately used to explain the presence of trans identity and have further been used as criteria for denying access to gender-related care.

Standards of Care

The Standards of Care real-life experience (RLE) or real-life test (RLT) to gain access to care illustrates this dilemma. The RLE/RLT was a tool created as a means to confirm that a person is able to function in all aspects of life in their felt gender identity without the benefit of medical intervention. The original Standards of Care (1979) required a year of RLT, which proved to be painful, detrimental, and dangerous to those who endured it. Later versions of the Standards were more subjective, and the current (seventh) edition of the *Standards of Care (SOC) for the Health of Transsexual, Transgender, and Gender Nonconforming People* requires only a referral letter from a certified medical professional to qualify an individual for treatment.

Even so, these requirements have the potential to put trans people at greater risk for social, emotional, and institutional violence. Additionally, trans people are more likely to experience systemic traumas such as barriers to accessing employment, housing, community, or any form of medical care. Finally, prolonging the wait for care creates an atmosphere in which trans people are likely to suffer intrapsychic/individual traumas such as the ongoing and profound distress associated with not living one's core or felt sense of self. Consequently, trans people often feel they must underreport experienced traumas for fear that the trauma itself will be misinterpreted as the cause of gender dysphoria and/or a sign of "instability" that requires resolution prior to accessing gender-related care.

The implications of the extended evolution from psychosis to identity diversity are significant. By making access to care conditional on social conformity, the medical and mental health systems inadvertently created an expectation that in order for trans people to access care, they needed to have a monolithic clinical picture devoid of trauma or any of its consequences.

Subsequent Standards of Care have evolved to identify gender dysphoria, the level of distress

associated with experiencing dissonance in the physical body and felt sense of self, as the point of intervention. The current SOC (seventh edition) recognizes the diversity of trans identities and the wide range of interventions that can aid in resolving distress. With the focus of intervention on resolving distress rather than resolving gender, trans people's experiences of trauma and its related symptoms can be integrated into treatment that is both gender and trauma informed. Medical and mental health systems have only recently had access to learning about trauma and trauma-informed care for trans people. Consequently, trans communities remain affected by that legacy and have more difficulty experiencing the connection, safety, and trust that is crucial to trauma care and healing.

Causes of Trauma for Trans People

Systemic Causes

Trans people experience a profound and disproportionate amount of trauma individually, interpersonally, and societally. Trans people experience disproportionate levels of physical assault, sexual abuse, verbal harassment, and domestic violence. The factors that contribute to trans people being disproportionately targeted by all forms of violence and trauma are multifaceted. People who are socially, emotionally, and financially underresourced; people who have internalized a negative or inaccurate sense of themselves; and people who are less likely to be supported, responded to, or believed are at greater risk for chronic traumatic stress and at greater risk of being targeted for abuse and violence. Trans people and the people around them may attribute experiences of trauma to gender identity or presentation when, more accurately, what leaves trans people vulnerable to trauma is the cumulative impact of societal oppression.

Social and Interpersonal Causes

The foundation of trauma for trans people is shaped by transphobia, microaggressions, social rejection, and disrupted attachments.

Transphobia

Transphobia is the pervasive and irrational fear and rejection of trans people as manifested in gender-nonconforming appearance, behavior, or role. Manifestations of transphobia on a systemic level can be seen in the ways in which gender conformity is established and reinforced by school settings, medical and mental health facilities, and work environments. Manifestations of transphobia on an interpersonal level can include the explicit exclusion of trans people in social or community events, interpersonal violence, domestic violence, intimidation, and verbal and physical abuse.

Microaggressions

Microaggressions refer to individual, interpersonal interactions that reinforce oppression. Trans people experience a level of chronic, cumulative, and traumatic stress in the form of microaggressions. Microaggressions may take the form of reactions by others to any perceived deviation from gender norms, gender identity, gender role behavior, or gender presentation. In the context of gender identity, cisgender (cis) identity, roles, expressions, and behaviors are actively socially reinforced, while deviation in gender identity, expression, and behavior is often met with hostility and social exclusion. Trans people describe and are often affected by daily harassment, rejection, hostility, and intimidation. That state of chronic traumatic stress creates a context for trauma.

Social Rejection

Social rejection describes the ways in which trans people experience barriers to forming relationships. Disruptions in attachment can occur as the trans person may not experience attunement to a core sense of self or experience. Trans people's experience of trauma often begins in childhood. Gender nonconformity in appearance, behavior, or role can be targeted for social alienation and rejection, along with verbal, physical, emotional, and psychological abuse from both children and adults. The chronic stress and cumulative trauma of a hostile environment affect trans people throughout their lives.

Disrupted Attachments

For trans people, inhabiting a body that does not accurately reflect the felt sense of self changes opportunities for attachment and care, social connection, societal interaction, and appropriate

medical care, as well as initiates a series of barriers to the resources that generate resiliency. This differential experience of and response to trans people on institutional, social, interpersonal, and individual levels can create a disproportionate experience of trauma.

Manifestations of Trauma

Body

Survivors of trauma often have difficulty feeling, experiencing, or being willing or able to take care of a body that has been the site of trauma. Awareness of hunger or thirst, body temperature, or bodily functions can be acute, incredibly diffuse, or absent, in part because the awareness of any bodily sensation can ignite some level of reexperiencing traumatic events. For trans survivors, this alienation from bodily sensations or needs is compounded by experiencing a body that not only is the site of trauma but also, at best, misrepresents the felt sense of self.

Inhabiting a body that may not reflect a felt sense of self and is the site of trauma can make accurately responding to bodily needs and caring for that body more difficult. Trans people can experience high levels of self-harm. The function of that self-harm may be to manage dysregulation, manage bodily sensation, or communicate levels of distress. Self-harm can also be a form of expressing anger, despair, or disgust with the body itself and can take the form of harming or attempting to modify genitals or other parts of the body that are considered gendering.

Trans people may also experience disordered eating. Eating disorders can be an expression of ambivalence to caring for the body. Manipulation of body size is also associated with efforts to shape the body toward a more masculine or feminine presentation or to render the body unappealing and therefore less available for social gaze.

Mind

Trauma changes the brain. The brain and body are designed to accelerate in the face of danger, respond, and then resolve or return to baseline. Without that resolution, the response system can be left to overrespond or underrespond. The consequences of chronic dysregulation manifest in a range of symptoms, which can include disruptions in attention, concentration, and memory; challenges in learning and social learning; disruptions in motivation; and negative self-concept and self-efficacy. For trans people, the experience of trauma and the present and real potential for rejection and violence can sustain a chronic level of dysregulation and exacerbate symptoms affecting the ability to process information and connection.

Relationships

Transphobia and microaggressions create the context for trauma in forming relationships and accessing community. Forming attachment and connection in emotionally underresourced, unsupported, or chronically traumatizing environments can be challenging. Barriers to employment and housing, as well as costs associated with gender care, are significantly at risk of abuses of power and domestic violence.

Trans people eager for connection and recognition, particularly in their affirmed gender, may accommodate familiar abusive patterns in connections or accommodate a level of transphobia, may take significant risks, and may experience the absence of overt transphobia as connection.

Boundaries in relationships can be complex. For trans people, an additional challenge can be gender identity and identity disclosure across relationships. A person may identify in the assigned gender at work, for example, and the affirmed gender outside of work. People may limit their experience of presenting as and living into the affirmed gender to specific relationships. Violations or threats of violation of those boundaries are abusive and can be a part of an abusive power dynamic in relationships.

Consequences of Trauma

Chronic Trauma

Trans people may come into care with chronic traumatic stress and multiple experiences of trauma. Traumatic stress and violence often begin for trans people at a very early age. The presence of that level of trauma may be so chronic that it becomes normalized by the individual. Without medical and mental health awareness, access, or knowledge of gender diversity, trans people may be well into adulthood before coming into care.

People who access gender care into adulthood often do so after years, even decades, of traumatic stress imposed by the attempts to live into the gender assigned at birth. Those years and decades can be characterized by notable over- or underachievement, limited or failed relationships, extreme personal or professional gender role stereotyped professions or behaviors (e.g., a trans woman who, prior to accessing care, works as a Marine or a firefighter), and significant, often completely undisclosed trauma(s). Coming into an affirmed gender identity in adulthood can also carry with it multiple, cumulative, and traumatic losses associated with the efforts to live in the gender assigned at birth. Threats to or loss of career, financial stability, social support, and loss of spouse or children are some of the possible costs of adult transitions.

Trauma Intervention and Care

Trauma intervention and care begin with establishing a connection, offering validation, identifying and restoring resources of safety, improving self-care, and increasing social support. Not being able to access resources, not being accurately seen and responded to, or being responded to with hostility and alienation is not only the absence of care but also can exacerbate the experience and impact of trauma.

Gender Binary in Treatment Services

Comprehensive trauma-related services are largely gendered. While trauma-informed services for cis male survivors are increasing, the default discourse for trauma-related care labels cis men as perpetrators and cis women as survivors. This gender designation is present in services, literature, self-help literature, and community support and resources, all of which are overwhelmingly segregated along the gender binary (male/female). This can affect not only trauma-related care but also affiliated care needs, including substance abuse services, eating disorder services, day treatment programs, care focused on suicidality, and treatment for self-harming behaviors. The gender binary is also present in trauma healing–related resources, community support groups, online resources, groups that support healthy relationship building between survivors, activist and artist groups, and groups focused on building awareness, social support, and care alternatives.

Gender Diversity in Treatment Services

Trauma-related resources that may be more informed and welcoming of gender diversity are not without complication for the trans person. If the person experienced trauma prior to "transitioning" or coming into their present, affirmed gender identity, identifying with any gendered group or service is likely to be complex. If the trans person is stealth, or does not openly acknowledge gender variance, identification with any gendered group may be stressful and, in some circumstances, may place the trans survivor at significant personal risk of further violence, isolation, and loss of housing, employment, and health care. Beyond community and relational constraints, trans survivors' own feelings, beliefs, or narratives regarding trauma(s) can be complex and painful. People identified or assigned female at birth (AFAB), or identified or assigned male at birth (AMAB), may have complex feelings or beliefs about the ways in which that identity, not the felt sense of self, contributes to a vulnerability to abuse and trauma.

Far-Reaching Effects and Mitigating Factors

The magnitude of a traumatic event or experience does not predict the effect that trauma will have on individual functioning. Instead, the magnitude of a trauma effect can be predicted by social and emotional context and any prior trauma(s) experienced by the individual. Family connection and support is consistently the strongest variable in mitigating the impact of trauma for trans people. Establishing a gender-affirming social and emotional context that includes a consistent and reliable home, a stable work/school environment, friends, and social groups creates a context in which a traumatic event can be experienced and resolved. If a person is confident that their family or caregivers are generally responsive to their needs, are concerned about their emotional and physical needs, and there are resources to meet those needs, trauma-related symptoms and their outcomes are significantly different.

Prior traumas that have overwhelmed both the neurobiological response system and the availability

of resources of resilience can also affect the likelihood and outcome of subsequent trauma. These include safe and stable housing, food, access to medical care and transportation, and community. Social and emotional resources available to restore the brain and body to a state of well-being are crucial to resilience. Access to interpersonal and social connection, responsiveness that accurately reflects one's felt sense of self and experiences, thoughts, and feelings are at the core of trauma recovery.

Travestis

Specific to South America, Latin America, and the Caribbean, *travesti* is a gender identity and sociopolitical identifier for those assigned male at birth who identify with feminine gender identities and perform feminine gender roles. Travestis differ from drag performers and crossdressers in that they medically feminize their bodies, as well as adopt feminine names and she/her pronouns. Travestis are also considered distinct from trans women, although differences have been debated, resulting in the homogenization of travesti experiences. As of the mid-2010s, South American trans social movements acknowledge travesti as a gender identity and political marker. This entry addresses the history of travesti identities, highlighting pivotal moments that shape understandings of travesti experiences.

Derived from *transvertir,* meaning "to transform," *travesti* challenges the overtly gendered and binary nature of language. *Transgender* and *travesti* remain separate due to different cultural linguistics. These differences mean that *travesti* remains untranslated. In some academic and political contexts, *travesti* is considered a derogatory word, but it remains a culturally important term by which people identify themselves. Gender freedom was commonplace, and travesti identities thrived prior to the imposition of colonial Western discourses of dichotomous gender, which drew from biblical texts with rigid gender laws. The newly colonized cultures repressed and punished individuals whose gender identities and

expressions were outside of binary categories. Gender elasticity was lost and has not been fully regained in postcolonial times.

Remnants of colonial thought permeate South American, particularly Brazilian, culture, with a thin line between tolerance of travestis and a need to attack and exclude them, owing to their ability to challenge patriarchal dominance and "queer" society. Travesti bodies question state-built gender binaries while simultaneously undermining the category of "woman," which serves to highlight the fragility of gender norm discourses. Travestis are subjected to the negative cultural assumptions of both male and female gender roles simultaneously. The use of culturally defined masculinity (*machismo*) and femininity (*marianismo*) expectations in Brazilian culture undermines and limits travestis' potential sociopolitical power.

Travestis mimic cis women through their gendered performance, thereby—perhaps subconsciously—reproducing the very norms that exclude them. Despite their typically low income, many travestis undertake feminization procedures, including hormone therapy, breast augmentation, and, regardless of the associated health risks, silicone injections. They do not desire to undergo genital surgery, which Western societies view as making them "less trans." South American trans communities criticize this form of *trans-meritocracia,* where those with more body modifications are perceived to be more validly trans than those with fewer. Although the right to change sex exists, the ability to remain outside of the gender binary remains elusive, reinforcing binary norms. Due to these gender-normative pressures, travestis are often unable to actualize their gender identity.

Travestis commonly experience poverty, abuse, and stigma, and few have formal employment because of a lack of education, which contributes to their social and economic marginalization. Many also have darker skin, which is culturally correlated with lower social and economic standing. Thus, travestis face numerous experiences of exclusion and discrimination as a result of the intersecting oppressions of transmisogyny, racism, and classism in their lives.

The marginalization that travestis experience due to the perceived social unacceptability of their bodies and lives leads Brazilian society to oscillate between viewing them as victims and as perpetrators. Much of the public associates travestis with sexuality, rather than with gender, which means that they are victimized by homophobia, and the extreme cultural intolerance of gender nonconformity means that they are viewed as criminal, sinful, and perverse. Through these beliefs, anticolonialists in Brazilian society unconsciously reinforce colonialist gender ideology. The result is that travesti bodies are viewed as bodies that do not matter. Although there are few well-developed methods for tracking incidents of violence in Brazil, the country has one of the highest levels of reported trans murders worldwide. Yet, even in South American LGB communities, the extent of anti-trans violence is perceived as less significant than other issues.

Gender in Latin American societies is grounded not in sex, like in Europe and North America, but rather on sexual behavior. However, it is a fallacy that being travesti results purely from their sexual behavior, and this belief shows how sex, sexuality, and gender are often conflated within South American society.

Since the 1970s, prostitution has become inseparable from travesti experiences, as social stigma has forced most to engage in sex work in order to survive. At the same time, the further stigma associated with being a sex worker means that travestis are unable to ever switch to a different occupation. Violence against travesti prostitutes, including by the police, is high, owing to societal perceptions that both travestis and prostitutes do not matter.

In response to violence and police discrimination, an increasing number of Brazilian travestis are relocating to mainland Europe. Becoming "Europeia" is the goal of many travestis because they perceive life there as safer and less oppressive. Marginalization, discrimination, and violence mean that travestis have little to lose by leaving South America, despite potential subjugation resulting from illegal emigration and the high levels of classism, racism, and anti-immigration sentiment seen across parts of mainland Europe.

For travestis who stay in South America, there is hope for the future. Although historically considered a pejorative term, *travesti* has been reclaimed as an identity and political noun. This reclamation seeks to decolonize attitudes toward gender roles and gender expressions within South

American cultures. Activists and supporters consider travestis to be parrhesiastic—that is, having the courage to say the truth. By simply existing, travestis practice parrhesia and serve to challenge historical gender norms, regardless of the potentially negative consequences. In highlighting the inequalities of society, travestis engage in a form of resistance that confronts social, economic, and political hierarchies and gives them opportunities to have a brighter future.

Tri-Ess

Tri-Ess, or the Society for the Second Self, is an international social and support organization for heterosexual crossdressers and their partners and spouses. Because men who crossdress have long been subjected to discrimination from the dominant society, female-presenting crossdressers often feel ashamed of their identities and do not know others like themselves. Before the rise of the Internet, many believed that they were "the only one." Tri-Ess has helped many crossdressing men accept themselves—and for their partners and wives to accept them—and provided a supportive community for both groups. Through its publications and media appearances, the organization has also increased awareness of the experiences of crossdressers and decreased the stigma they feel.

Development

The organization that would become Tri-Ess was established by Virginia Prince, a female-presenting crossdresser from Los Angeles, in 1961. Prince had begun *Transvestia,* a bimonthly magazine for crossdressers, and the initial members of the group were local subscribers. Prince invited the magazine's readers to a meeting, telling them to bring stockings and high heels but not informing them that the other crossdressers would be there. When the group was assembled, Prince had them don the female apparel, thus disclosing to each other and ensuring that they would maintain their shared confidence. Because of its origins, the organization was initially known as the Hose and Heels Club, but Prince changed its name to the Foundation for Personality Expression (FPE or Phi Pi Epsilon) the following year.

Prince envisioned FPE as the Alpha Chapter of a sorority-like crossdressing organization that would have chapters throughout the country and internationally, and by the mid-1960s, she had chartered several other U.S. chapters. Prince set strict membership requirements. Only cis heterosexual male crossdressers—whom she referred to as "true transvestites"—could join, as she wanted to dissociate the group from both gay and bisexual male crossdressers and trans women. In so doing, Prince sought to address the two main fears of the wives and partners of cis heterosexual male crossdressers: that their husbands and boyfriends will leave them for men or that their partners will begin to identify as women. Prince maintained tight control over the organization until 1976, when FPE merged with the Mamselle Sorority, a Southern California crossdressing group led by Carol Beecroft, to become the Society for the Second Self or Tri-Ess.

Becoming Tri-Ess's first president, Beecroft worked to make the organization more inclusive and more visible. She made alliances with trans women and gay and bisexual men, as well as enlarged the group's outreach and programming. She began the group's journal, *The Femme Mirror,* which she edited for more than a dozen years, and started its annual Holiday En Femme event, in

which members would gather each November in a different city and go out crossdressed. For some members, the holiday gatherings were the only opportunity they had to be feminine in public. These events also gave crossdressers who lived far from a Tri-Ess chapter a chance to meet and socialize with others like themselves. Beecroft also initiated a confidential mail service, organized a project to donate books on crossdressing to local libraries, and encouraged the wives of the crossdressing men to become more involved through the creation of Couples Groups.

In 1988, after Beecroft was incapacitated in an accident, Jane Ellen Fairfax was elected chair of the Board of Directors and expanded the organization's vision, which was reflected in the acronym "FIBER":

Full personality expression, in both its masculine and feminine parts

Integration of masculine and feminine elements to live as a whole, fulfilled person

Balance between masculinity and femininity

Education of crossdressers toward self-acceptance and of society

Relationship building in the context of crossdressing

Fairfax also focused greater attention on the needs of the wives and partners of crossdressers. With her guidance, Tri-Ess decided to give them full membership status (previously, they had been considered "guests"); established *The Sweetheart Connection,* a quarterly newsletter by and for wives; and started the Spouses' and Partners' International Conference for Education (SPICE). During this time, Fairfax's wife, Mary, became editor of *The Femme Mirror* and greatly expanded its content. Also, Melanie and Peggy Rudd began the Dignity cruises, which, like the Holiday En Femme events, enabled crossdressers to be out in a safe, supportive environment and meet others like themselves.

Growth

Prince's vision of chapters across the United States began to come to fruition in the 1990s, as crossdressers and their families, who were eager to meet others like themselves and find support, formed Tri-Ess affiliates in different cities. At its height in the early 2000s, Tri-Ess had 25 chapters, including some in southern and midwestern cities that, until then, had few resources for trans people. The chapters sponsored not only social events but also sessions on topics like feminine dressing, legal issues, telling partners and children, and self-defense.

Decline

By the end of the second decade of the 21st century, the number of members and chapters had fallen precipitously. Because many men now find it somewhat easier to go out crossdressed, they feel less in need of an organization. Also, fewer young male-assigned individuals today identify as crossdressers; instead, they more often describe themselves with terms like *gender fluid, gender nonconforming,* and *genderqueer.* Internal factors have also played a role in the decline. Mary Fairfax became ill and could no longer edit *The Femme Mirror,* and Jane had to step back from Tri-Ess to care for her. As of 2020, only six chapters remain.

Impact

Even though the organization is seemingly past its heyday, Tri-Ess deserves a tremendous amount of credit for bringing formerly isolated crossdressers together and helping them recognize that they are not pathological or immoral. It has provided support to tens of thousands of crossdressers and their wives and partners and has increased the visibility of this often overlooked segment of the trans community.

Two-Spirit People

Two-spirit (sometimes *two-spirited*) is a term used by Indigenous people in North America to describe individuals who combine masculine and feminine. The term harkens back to honored cultural roles for gender minority people in Indigenous nations across Turtle Island (North America) prior to the 1930s. This entry begins with an overview of the origins of the term *two-spirit;* discusses how the identity relates to earlier terms; briefly details the role of colonial schools in the eradication of Indigenous gender roles; identifies benefits, limitations, and cautions to consider when using the term *two-spirit;* and concludes with a discussion of the term's recent use.

Origins of the Term

The term *two-spirit* rose to prominence in the 1990s, and some trace its origin to a dream reported by Elder Myra Laramee (Cree/Ojibwe/Métis) to attendees at the Third Annual Gathering, which was organized by American Indian Gays and Lesbians in August 1990 and held at what was then the Dr. Jessie Saulteaux Centre near Beausejour, Manitoba, Canada (referred to hereafter as "the Annual Gathering"). Others assert that the term *two-spirit* was in use as early as the 1960s in San Francisco.

If the term did emerge in August 1990, it spread quickly and was soon being used in print. One month after the Annual Gathering, the term appeared in an essay by settler Canadian poet Daphne Marlatt in the literary journal *Tessera*. Marlatt attributed the term to a talk given by Indigenous poet Chrystos about lesbians among the Menominee (Mamaceqtaw), describing them as "Two-Spirit People." Social work scholar Bill Ryan notes that the fall 1990 edition of *Two Eagles: An International Native American Gay and Lesbian Quarterly* contained three letters using the term *two-spirit* or *two-spirited* from participants at the Annual Gathering. Such references suggest that the term was being adopted by Indigenous people who had previously (or, perhaps, also) identified as lesbian, gay, bisexual, trans, queer, intersex, or asexual (LGBTQIA+) and was also taken up by settlers to refer to Indigenous LGBTQIA+ people.

Historical Precursors

Although *two-spirit* became popularized in the 1990s, the gender roles it describes are much older. It has been estimated that over 160 Indigenous languages in North America contain a term to describe someone whom settlers might now describe as trans. Some examples include *lhamana,* a Zuni word some translate as "man-woman," and *nadleeh,* a Diné term often translated as "one in a state of change." The Anishinaabe language has several gender terms, the most well known being *agokwe*. Reports of agokwe that were written by settler men during the Indian Removal Era (1828–1849) highlighted what they viewed as cross-gender clothing and activities, as well as same-sex attraction, often conflating the two.

Those who popularized the use of *two-spirit* aimed, in part, to replace *berdache,* a term of Arabic origin settlers used to describe Indigenous people whose gender seemed to mix or shift between masculine and feminine. *Bur-dash* appears in *A Dictionary of the Chinook Jargon* from 1863 by ethnologist George Gibbs, where it is equated with being intersex. In the early 20th century, *berdache* was used in the fields of natural history, ethnography, and anthropology. The term appears in a 1902 article on the Jesup Arapaho Expedition (1899–1901) written by Alfred Louis Kroeber and published by the American Museum of Natural History. With the introduction of the term *two-spirit, berdache* became seen as archaic and is

now rarely used outside of anthropology, and even there it is often critiqued.

Impact of Residential or Boarding School Incarceration

Traditional Indigenous gender roles were targeted by colonial efforts to destroy Indigenous cultures and languages, as well as to assimilate Indigenous people into the settler population. Colonial governments in North America forcibly confined Indigenous youth to reeducation facilities as part of an effort to "kill the Indian in the child." In the United States, so-called Indian boarding schools numbered over 500 and ran from 1819 to 2007, incarcerating over 100,000 children. In Canada, "Indian residential schools" operated from 1884 to 1996, and although they numbered only 130, over 150,000 children served time there, amounting to three quarters of First Nations youth. Residential schools were usually operated by Christian religious orders, while boarding schools were mostly operated by the U.S. government. In Mexico, schools called *internados* operated sporadically from 1926 through the 1940s.

These obligatory "schools" compelled generations of Indigenous children to speak only settler languages, adopt Christianity, and conform to Christian gender and sexual norms. Upon arrival, school authorities separated boys and girls, cut children's hair to conform to gendered settler styles, and dressed them in gendered uniforms. Forcible regendering of two-spirit students, along with indoctrination into Christian traditions that viewed their difference as sinful, instilled animosity toward two-spirit people. By 1930, many Indigenous communities had lost their traditional roles for two-spirit people.

Scholars note that the impact of residential and boarding schools extends beyond damage done to those forcibly confined, negatively affecting descendants of survivors, as well as their communities. Attending residential or boarding school is correlated with increased psychological distress, depression, substance use, and suicidality. Two-spirit people also exhibit distinct and significant resilience to social and health stressors, drawing on multiple resources to support the mental, physical, social, and spiritual well-being of themselves and their communities.

Benefits of the Two-Spirit Label

Self-identifying as two-spirit emerged in the context of a broader movement to revert to Indigenous-language names for places and people. As a pan-Indigenous term, which spans Indigenous nations, *two-spirit* provides an English term around which to organize, supporting broad intelligibility. Indigenous terms, such as *lhamana* or *nadleeh,* may be unfamiliar to those outside the nation from which the word originates. Two-spirit identity enables Indigenous LGBTQIA+ people to connect their experience to the history of their Indigenous nation or to the history of Indigenous people more broadly.

As the name itself suggests, *two-spirit* asserts a spiritual element to identity that is largely absent from LGBTQIA+ communities. In the wake of forced Christianization, many Indigenous communities adopted negative attitudes toward LGBTQIA+ people, and some LGBTQIA+ people report having to leave their Indigenous community due to threats or violence. Qualitative studies with Indigenous people have found that LGBTQIA+ identity was sometimes a factor separating them from Indigenous community belonging and aligning them with urban, settler society. In tracing its lineage to traditional gender roles, two-spirit people framed themselves as insiders to their Indigenous nation. Indigenous scholar Alex Wilson (Opaskwayak Cree Nation) has described Indigenous LGBTQIA+ people as "coming in" (i.e., to Indigenous community), rather than "coming out," when they adopt a two-spirit identity. Growing awareness of two-spirit identity has assisted many Indigenous communities to revise or reimagine cultural and ceremonial roles for two-spirit people. Due to the intentional reference to Indigenous cultural belonging in the term *two-spirit,* its use by settlers to self-identify themselves is considered cultural appropriation.

The two-spirit label has increased the visibility of Indigenous people within LGBTQIA+ communities, where white supremacy, racism, and colonialism have made many Indigenous people feel unwelcomed. Some LGBTQIA+ organizations have now added a "2" or a "2S" (i.e., "LGBTQIA2+" or "LGBTQIA2S+") to represent two-spirit people, although this practice has also been criticized for mixing settler and Indigenous frameworks, potentially assimilating two-spirit identity.

In the field of HIV research, two-spirit identity has supported intersectional analyses of the HIV pandemic by enabling researchers to examine factors of gender (or, in some cases, sexuality) and Indigeneity simultaneously. Such intersectional analysis supports discussions of how HIV transmission in Indigenous communities is shaped by historical, intergenerational, and ongoing impacts of colonialism.

Limitations and Caveats

Although two-spirit identity has benefits, it also has limitations. There is a risk that pan-Indigenous terms may replace Indigenous-language concepts, furthering the erosion of Indigenous languages and cultures. Indigenous scholars note that *two-spirit* does not encompass all LGBTQIA+ Indigenous people and is used primarily by American Indian or First Nations people. The term is used by some Métis, as evidenced by the Manitoba Métis Federation adding a Two-Spirit Michif local to its federation in 2019. However, two-spirit identity has not been broadly adopted by Alaskan Native, Inuit, or Kanaka Maoli (Indigenous people of Hawaii), and its use internationally is sparse.

A second issue relates to disagreements regarding whether *two-spirit* applies to gender, sexuality, or both. A Canadian study of bisexual mental health in the province of Ontario, for example, found that 39% of the First Nations, Métis, or Inuit participants used *two-spirited* to describe their sexuality, while 29% used the term to describe their gender. Some scholars note that most Indigenous nations did not engage in sexual identity labeling and that historically, two-spirit roles were roles of gender. Two-spirit scholar Harlan Pruden (Cree) has emphasized that "two-spirit" is not a gender or sexual identity label but an Indigenous analysis of gender—that is, a thoughtful reflection on the structure and nature of being gendered. In contrast, Albert W. McLeod (Nisichawayasihk Cree, Norway House Métis), a founding member of the International Council of Two-Spirit Societies, has specified that two-spirit identity is about Indigenous people who identify as lesbian, gay, bisexual, trans, queer, and questioning.

For some Indigenous LGBTQIA+ people, "two-spirit" is one of many identities they use. Some Indigenous LGBTQIA+ people report using a non-Indigenous label, such as trans, to show solidarity against transphobia, identifying as two-spirit with Indigenous people to emphasize Indigenous cultural belonging and using an Indigenous-language term in their community to emphasize their connection to culture and history.

A third caveat regarding the use of *two-spirit* relates to expectations associated with the identity. In addition to describing a gender role, two-spirit identity may carry an expectation of Indigenous cultural and spiritual roles. Indigenous scholar Leanne Betasamosake Simpson (Michi Saagiig Nishnaabeg) notes that two-spirit people have been leaders in protesting colonial resource extraction and the occupation of Indigenous territory. The embeddedness of two-spirit roles into Indigenous nations is one of the reasons scholars caution against equating two-spirit with trans or queer. Scholars also caution against framing two-spirit people as transgressing gender norms, since they may be embraced by the gender systems of their Indigenous nation.

Recent Use

Many Indigenous organizations have adopted the term *two-spirit*. In 1992, for example, Gays and Lesbians of the First Nations, a Toronto-based organization, changed its name to 2-Spirited People of the 1st Nations. The Annual Gathering at which the term *two-spirit* is said to have emerged was the third in a series; the first gathering was held in 1987 and titled The Basket and the Bow: A Gathering of Lesbian & Gay Native Americans. Annual gatherings and related events now commonly use *two-spirit* in their titles and promotional materials.

As populations in North America become increasingly secular, questions have arisen as to whether two-spirit identity necessarily carries spiritual meaning. Some argue the term embraces a pan-Indigenous spirituality, in which two-spirit people embody a balance of feminine and masculine; others consider the reference to two spirits to be metaphorical.

Indigenous filmmaker Thirza Cuthand (Cree) coined the term *Indigiqueer* to describe Indigenous LGBTQIA+ people who do not embrace *two-spirit* due to its association with having two spirits, or with gender rather than sexuality. The term has

been used by poet Joshua Whitehead (Oji-Cree), whose 2017 poetry collection was entitled *Full-Metal Indigiqueer*. Whitehead's book was nominated for a Lambda Literary Award in 2018, prompting the author to withdraw from the competition, arguing that his nomination in the "Transgender Poetry" category misrepresented his identity as a two-spirit person.

The use of *two-spirit* as a pan-Indigenous term highlights the role of white supremacy and heteropatriarchy—the privileging of heterosexual and cisgender male authority—in colonialism. Some embrace two-spirit identity as a way to resist binary views of gender and sexuality, often as part of a broader effort to decolonize—remove colonial influences from their lives—and to Indigenize—increase their familiarity with the values, beliefs, and practices of their Indigenous nation.

United States Transgender Survey (USTS)

The United States Transgender Survey (USTS) is the largest survey ever conducted to examine the experiences of trans people in the United States, with nearly 28,000 respondents. It is notable for its scope, sample size, geographical reach, and representation of a wide range of identities and experiences. As such, the USTS is one of the most important studies to document the experiences of trans people in the United States. It is an essential source of information for a range of disciplines and the general public. This entry provides an overview of the USTS, including its background and purpose, development, outreach strategy, data collection period, findings, and impact.

Background and Purpose

Advocating for the rights of trans people requires data to provide evidence of the population's unique experiences and outcomes, many of which are disparate when compared to non-trans people. However, advocacy has historically been hampered by the limited availability of such data. The National Center for Transgender Equality (NCTE) conducted the USTS in 2015 to address data needs. The USTS was the successor to the 2008–2009 National Transgender Discrimination Survey, which had 6,456 respondents and was the first study to broadly examine the experiences of trans people in the United States.

The USTS was developed to conduct an in-depth, comprehensive examination of experiences and outcomes and to become an indispensable advocacy resource. It also sought to fill gaps left by the lack of data collected about trans people in national surveys, including most federal population-based surveys, which do not capture critical life experiences for the trans population.

Survey Development and Outreach

The USTS questionnaire was developed using a collaborative, community-based research approach, involving individuals with lived experience, advocacy and research experience, and subject matter expertise. The survey covered a wide array of topics, including income, employment, health, education, family life, faith communities, housing, interactions with the criminal justice system, public accommodations, and harassment and violence. Among the study's unique aspects, the USTS included questions that mirrored federal and other existing surveys to allow for comparisons to the U.S. general population.

The main objective of the outreach strategy was to recruit a diverse sample of trans people that reflected the U.S. trans population. Outreach efforts also aimed to reach people who were most likely to be underrepresented or with limited access to the online platform. Over the 6-month outreach period, the strategy centered on creating multiple points of access for trans people to find and complete the survey. This occurred through sustained engagement with hundreds of supporting organizations

that promoted the survey to their members and through the USTS Advisory Committee, which provided guidance on outreach and promoted the survey through their networks. The strategy employed multiple outreach and communication methods to engage and recruit respondents into the study, including a USTS website, Facebook, Twitter, and other social media platforms, print media, blogs, a photo campaign, a survey pledge, and conference attendance.

Data Collection and Outcomes

The USTS was open to individuals 18 and older who were residing in the United States, U.S. territories, or U.S. military bases overseas at the time of the survey. The USTS was available in English and Spanish for 34 days in the summer of 2015. Several supporting organizations hosted survey-taking events to increase accessibility for those who had limited or no computer or Internet access or just wanted a safe place to take the survey.

Among the notable USTS outcomes is the unprecedented number of respondents (27,715), which created an opportunity for in-depth analyses based on various demographic categories. The sample included respondents from ages 18 to 87, representing a range of gender identities. The USTS sample also reflected wide geographical representation, yielding respondents from all 50 U.S. states, the District of Columbia, and several U.S. territories and military bases overseas.

Despite the USTS's large sample, sampling limitations affected its representativeness of the trans population. As a nonprobability sample, the results are not widely generalizable. The USTS also did not fully capture the experiences of populations who are often underrepresented in surveys, such as people of color, older adults, and people who live in rural areas. Furthermore, as an online survey, there is a known bias in demographic representation, since respondents are more likely to be white, be more highly educated, and have higher incomes.

Findings

NCTE published a series of reports, including a full report of the USTS findings and breakout reports that examine the experiences of respondents by state, race and ethnicity, and other demographic characteristics. The reports include various presentations of the findings, including experiences shared by the full USTS sample, comparisons to groups within the sample, and comparisons to the U.S. general population.

Among the thousands of data points yielded from the USTS, several overarching themes emerged. This includes evidence of widespread mistreatment, harassment, and violence in all areas of life for trans people, including experiences of verbal harassment, physical assault, and sexual assault at school, in the workplace, in health care settings, and in public accommodations. The findings also showed severe economic hardship and employment and housing instability, including large disparities between the experiences of USTS respondents and the U.S. general population. Respondents' accounts also demonstrated the detrimental effects of discrimination on physical and mental health. Furthermore, barriers existed for access to key services in a range of issue areas, such as obtaining accurate identity documents and receiving gender-affirming health care. Additionally, examinations by various demographic categories demonstrated the compounding impact of discrimination based on other aspects of identity, such as race and ethnicity, gender identity, immigration status, and disability.

USTS Impact

The USTS has had an unprecedented impact on advocacy due to the wide applicability of the data and the accessibility of the information. Given the multitude of issue areas addressed in the survey, the USTS provides vital data documenting pervasive issues, highlights vulnerabilities resulting from limited access and barriers to resources and systems, and demonstrates community and population needs. The USTS has been influential in increasing knowledge about the experiences of trans people, and the reports have become essential resources for advocacy, affecting numerous fields, including policymaking, legislation, litigation, health care, education, philanthropy, and the media.

V

Veterans

Trans people are overrepresented among military veterans in the United States. More specifically, trans individuals are two to three times more likely to have a history of military service compared with cis individuals in the general population. The U.S. Department of Defense (DoD) has a history of policies that banned trans people from the Armed Forces. In contrast, the Veterans Health Administration (VHA) established policies for inclusion of trans veterans in 2011 and subsequently began providing medical and mental health care to trans veterans throughout VHA facilities. Research on trans veterans remains relatively limited, but scholars increasingly describe characteristics and experiences of this particular population. This entry summarizes available scholarly literature on trans veterans, including the prevalence of trans veterans in the United States, VHA policies and procedures for providing health care to trans veterans, and discrimination and mental health experiences among the population.

Prevalence

The trans veteran population mostly comprises individuals who served in the military as the sex they were assigned at birth and medically transitioned after being discharged. Prevalence rates of trans veterans are based on population-based estimates, community samples, and research on veterans who are enrolled in VHA services. In 2014, Gary Gates and Jody Herman estimated there were 134,300 trans veterans in the United States, thus comprising 0.6% of the veteran population (21.5 million). Although trans people make up a small portion of military veterans, this suggests that trans people are twice as likely to participate in the military compared with cis individuals. This estimate was further supported by data from the 2015 United States Transgender Survey (USTS), in which 18% of almost 28,000 respondents self-identified as military veterans, double the rate of veterans in the general population. Analyses of VHA medical records, identifying trans people by related diagnoses (e.g., gender dysphoria), additionally show trans people as overrepresented among the veteran population, being three times more common than cis veterans.

Veterans Health Administration (VHA)

The Veterans Health Administration (VHA) is the largest health care provider for trans people in the United States. Moreover, trans veterans tend to use VHA services more than cis veterans do. Preliminary research showed inconsistent treatment experiences reported by trans veterans who sought services from the VHA. A minority of individuals indicated positive experiences, such as being provided with trans-related health care (e.g., hormone therapy). However, more frequently, trans veterans described receiving prejudiced treatment, including being denied routine health care services available to other veterans.

Trans Policies and Programs

In 2011, the VHA established policies for providing health care for transgender and intersex veterans, thus directing VHA service providers to treat trans veterans with the same dignity and respect as other veteran patients. This was a significant change, especially as the VHA's policy became explicitly discrepant with that of the U.S. military, which maintained its ban on trans people. Beyond promoting inclusive services for trans veterans, the 2011 directive (VHS Dir 2011-024) mandated the provision of trans-specific health care by VHA service providers, including hormone therapy, mental health treatment, evaluations for gender-affirming surgery, and care following any trans-related surgeries. Under the policy, trans-related surgeries were not financially covered or provided by the VHA. Since 2011, the VHA has made minor revisions to its policy, but the coverage of services for trans veterans remains the same.

Shortly after the VHA enacted its 2011 directive, it also launched an LGBT program under the Office of Patient Care Services. The program developed extensive educational and training opportunities for VHA service providers across the country, including the following: an online repository of educational materials and a list of VHA support groups; online trainings, including specialty endocrinology (such as hormone therapy) and mental health trainings; access to interdisciplinary e-consultation for individual patient issues; and training and consultation for interdisciplinary teams through videoconferencing. In addition, the LGBT program created posters ("We Serve All Who Served") to display at VHA health care facilities to promote the inclusion of LGBT veterans. Finally, several VHA sites started psychology fellowships to encourage "LGBT veteran health care" specialization by training clinicians.

VHA Treatment Experiences

Research indicates that more trans veterans have used the VHA for health care services since the 2011 policy went into effect. Specifically, between 2011 and 2013, there were 985 new trans veterans enrolled in the VHA, making up 40% of trans veteran patients identified between 2006 and 2013. This makes sense, given that trans veterans were more likely to receive respectful and informed services, as outlined in the directive. More recently, the USTS found that 40% of trans veterans had accessed VHA health care services, exceeding the typical utilization rates of U.S. veterans.

Scholars have also examined rates of gender identity disclosure by trans veteran patients, given that disclosure is commonly avoided by trans people, if possible, because of anticipated discrimination and prejudice. The USTS found that 72% of trans veterans had disclosed their gender identity to VHA service providers. However, in a 2019 study of LGBT veterans, Michael R. Kauth and colleagues found that only 38% of trans veterans had disclosed their gender identity to VHA service providers, even though the majority (67.5%) of participants said they felt comfortable doing so.

Beyond treatment utilization and personal disclosure, scholars have also collected data about the experiences of trans veterans who are enrolled and receiving VHA services. In the USTS, nearly half (47%) of trans veterans reported they were always treated with respect at VHA facilities, compared with 3% who said they were never treated respectfully. In the previously mentioned study of LGBT veterans by Kauth and colleagues, 64% of all participants viewed their VHA site as either "somewhat welcoming" or "very welcoming," while 18% viewed it as "unwelcoming." There were no significant differences between the cis and trans participants, but trans men reported feeling less welcomed than trans women by VHA providers.

As illustrated above, quantitative research on the treatment experiences of VHA-enrolled trans veterans has had mixed results. A 2017 qualitative study of 201 trans veterans by Jessica A. Chen and colleagues found that the VHA was a source of both support and distress among trans veterans. In fact, 22% of participants described dealing with VHA services as among the hardest issues they faced as trans veterans. To the contrary, 20% of participants reported accessing VHA services as among the most positive aspects of being a trans veteran. Accordingly, additional research is needed to provide a more comprehensive understanding of VHA experiences among trans veterans.

Discrimination

Despite the implementation of VHA trans-inclusive policies, trans veterans still face the same elevated

rates and far-reaching experiences of discrimination as other trans people. It is unclear whether veteran status influences discrimination among trans veterans. However, as indicated by results from the USTS, experiences of discrimination are more prevalent among trans people with stigmatized identities beyond gender identity (e.g., people of color, undocumented immigrants, people with disabilities, homeless people, sex workers). Furthermore, additional stigmatized identities showed a cumulative effect on discrimination (e.g., a person of color who is also an immigrant and has a disability would be more likely to report experiences of discrimination than a person of color without those additional identities).

Minimal research has been conducted on the diversity of trans veterans, but it is assumed that findings from the USTS apply to trans veterans as well, such that discrimination is more common among those who are stigmatized in other ways. Another study found that Black trans veterans were disadvantaged in multiple areas of life, such as being almost two times more likely than white trans veterans to experience homelessness. In addition, Black veterans were almost three times more likely to have a history of incarceration compared with white trans veterans. Certainly, more research is needed to learn about the diverse experiences among the trans veteran population.

Other research also indicates that trans veterans tend to experience greater homelessness. For instance, a 2013 study found that 21% of trans veterans had a lifetime history of homelessness, compared with 18% of trans people overall (the rate of homelessness in the general population is 7%). The number of homeless trans veterans was also found to increase by 89% between 2015 and 2018, as reported by the U.S. Department of Housing and Urban Development. Employment discrimination, which can contribute to housing instability, was also reported more often by trans veterans, compared with other trans people, in the National Transgender Discrimination Survey (2011).

Discrimination in the Military

Scholars and trans rights advocates describe the military's history of bans on trans people as discriminatory and argue that the DoD's trans-prohibitive policies have promoted stigma and prejudice against trans service members. Therefore, it is not surprising that trans veterans have reported more frequent experiences of discrimination while serving in the military.

Trans veterans also report having experienced discrimination during active service related to the previous "Don't Ask, Don't Tell" (DADT) directive that condemned sexual minorities. For instance, trans veterans frequently described having been questioned by peers and superiors about their sexual orientation prior to the DADT repeal, as they were incorrectly assumed to be gay, lesbian, or bisexual. Regardless, this means that trans veterans, having served as their birth-assigned sex, had to hide their true identity in order to remain in good standing or risk being discharged under DADT or policies specifically directed to prohibit trans service members.

Military sexual trauma (MST) is an extreme yet common form of discrimination experienced by trans veterans. MST is defined as "a physical assault of a sexual nature, battery of a sexual nature, or sexual harassment which occurred while veterans were serving on active duty" (Title 38 U.S. Code 1720D, 2006). Research involving VHA-enrolled veterans shows that trans veterans, compared with their cis counterparts, report more frequent incidents of MST (15% vs. 6%). Among trans veterans, trans men, typically having served as women, report sexual assault twice as often as trans women, who typically served as men (30% vs. 15%). These numbers exceed the rates of MST reported by cis women and men: 1% and 20%, respectively.

Mental Health

The correlation between discrimination and mental health is well understood; marginalized populations, such as trans people, tend to face more discrimination and consequently suffer higher rates of mental health problems. However, research findings are mixed as to whether trans veterans experience the same or more frequent mental health issues compared with other veterans. The bulk of scholarly work has found that trans veterans are more likely than their cis

counterparts to experience mental health issues, especially depression, substance abuse, posttraumatic stress disorder, and suicidal behaviors. For example, VHA-enrolled trans veterans were found to be more than twice as likely to die by suicide than their cis counterparts. Moreover, when considering race, health disparities increase among trans veterans, as indicated by more frequent substance abuse and serious mental illness, among a host of other medical issues, for Black trans veterans.

Increasingly, researchers report similar rates of mental health problems for trans and cis veterans. Furthermore, research focusing on resilience has found that having served in the military may act as a protective factor against mental health problems for trans people. For instance, a history of prior military service has been shown to predict fewer depressive symptoms and improved aspects of psychological health among older trans veterans. In addition, prior military service significantly weakened the relationship between identity stigma and depressive symptoms; without military service, identity stigma was significantly related to more depressive symptoms and lower psychological health.

VIOLENCE

Definitions of violence vary because violence is complex and multifaceted. A comprehensive definition is provided by the World Health Organization (2002), which characterizes violence as "the intentional use of physical force or power, threatened or actual, against oneself, another person, or against a group or community, that either results in or has a high likelihood of resulting in injury, death, psychological harm, maldevelopment, or deprivation" (p. 4). Violence can take many forms, including microaggressions, verbal abuse, physical and sexual violence (e.g., battery, assault, murder), and even political or structural violence (e.g., policies that criminalize gender-nonconforming behavior or that authorize discrimination). This entry focuses on the high rates of verbal harassment/abuse and physical and sexual violence among trans people across the globe. It also addresses the risk factors that demonstrate which trans people may be at

greatest risk for experiencing violence, the characteristics of the perpetrators of this violence, and the effects of the violence on life course development.

Verbal Violence

Across various communities and methodologies, research has consistently demonstrated that trans people experience high rates of verbal violence, including threats, harassment, and abuse. Studies in a variety of countries and communities also show that the vast majority of trans people have experienced verbal harassment or violence throughout their lives. Verbal violence begins at a young age for many trans people, sometimes even before individuals report recognizing their gender difference, and this early violence is often perpetrated against youth by family members. As trans children's social circles expand with school and other activities, the types of harassers and abusers broaden as well, to include friends, teachers, religious leaders, and a variety of others. Research has consistently found that trans youth report experiencing verbal violence and bullying in schools, such as receiving disparaging comments about their gender presentation, admonishments to gender conform and act like "a real man" or "a real woman," and harassment about their gender identity itself. These verbal assaults convey the message that their gender identities are "wrong" or worthless and that they are somehow wrong about their own sense of their identity or expression. Verbal violence often persists into adulthood but can again broaden to become verbal harassment from intimate partners, coworkers, law enforcement officials, public workers, and even strangers on the street. In studies that have inquired about frequency of experiences (as opposed to a yes/no question asking, "Have you ever had the experience of . . ."), many trans people report multiple experiences of verbal harassment from a variety of perpetrators. Thus, verbal violence is not a one-time occurrence for a majority of trans people but often a series of negative incidents across their lifetimes.

Physical and Sexual Violence

While many studies find that nearly all trans respondents report experiencing verbal violence at some point in their lives, a disproportionate number of trans people, as compared with cis people, also report experiencing physical and/or sexual violence. Similar to the patterns of verbal violence, these experiences start in childhood, and perpetrators vary greatly. For example, comparisons of adult siblings have found that trans siblings report a greater number of lifetime violence experiences than their cis siblings, and among public school youth in the United States, studies suggest that middle and high school–age trans people experience more violence than their cis counterparts. The types of reported violence are also highly varied and include intimate partners' sexually assaulting them, strangers throwing objects at them on the streets, coworkers pushing and shoving them in the workplace, and a host of other types of physical and sexual assaults. In addition to experiencing physical or sexual violence directly, many trans people report knowing other trans individuals who have been physically or sexually harmed. Thus, the experience or perceived threat of violence due to their gender identity is nearly universal in the trans community.

The motives for violence against trans people are difficult to study. Relatively few studies disentangle violence that participants believed was motivated in whole or in part by their gender identity (violence that could be called a hate or bias crime in some jurisdictions) from non-bias-motivated violence. For example, someone could be robbed and beaten specifically because they are trans, or they could be mugged without the perpetrator's knowing or considering their gender identity. In the limited research that has attempted to examine these two types of violence as separate phenomena, the addition of bias-motivated violence explains at least some of the heightened rates of violence experienced by trans people, but bias motivation does not seem to completely account for the difference. Trans people also appear to experience non-bias-motivated violence at high levels. Some studies have suggested that the high rates of physical and sexual violence that are not directly motivated by someone's gender identity may be explained in part as due to the increased likelihood of trans people having multiple vulnerabilities, including being low-wage workers or unemployed, having high rates of homelessness, and/or engaging in sex work or other survival economy activities. However, trans people in those vulnerable situations still

often report higher frequencies of violence than do their cis counterparts, such as trans sex workers experiencing more violence than cis sex workers in the same community. Other differences between these types of violence have also been found. In studies that asked participants to compare experiences of violence that were motivated and seemingly not motivated by gender identity bias, the ones motivated by bias were reported to be more violent and injurious. More research is needed to help clarify the ways that anti-trans bias can account for increased rates of violence and when other vulnerabilities have an effect.

When looking more closely at the most extreme form of violence, murder, multiple studies suggest that the amount of force used to kill trans people frequently far exceeds the amount needed to cause their deaths. This phenomenon is called "overkill," where trans murder victims are destroyed or obliterated, rather than simply killed. Evidence of overkill includes a person being shot or stabbed multiple times or being beaten to death. Globally, the murders of trans people most often occur in public streets or personal residences, and they disproportionately affect young trans women who are racial/ethnic minorities and/or immigrants and who are economically vulnerable. However, information on the murders of trans people largely comes from advocacy organizations monitoring media reports, rather than from systematic administrative or public health data collection. Currently, there are no standard practices for confirming someone's gender identity as a part of generating death certificates, and thus there is no official mechanism for knowing how many trans people are killed.

Risk Factors for Violence

Studies that examine which trans people are most at risk of experiencing violence have identified several factors that may make someone more vulnerable to victimization. One of the clearer findings is that different groups under the trans umbrella experience violence at different rates. Many studies have shown that trans women bear a disproportionate burden of violence compared with trans men. In particular, advocacy organizations have consistently found that trans women, particularly trans women of color, are at a heightened risk of being murdered. However, recent studies that have examined more gender liminal identities (e.g., genderqueer, androgynous, nonbinary) have found that people who are seen as violating the gender binary may face equal, if not more, violence than trans women. These studies suggest that being "visibly trans" may increase a person's risk of experiencing violence. Some research also indicates that the risk of violence increases when someone's identity documents (e.g., a birth certificate) do not match their gender presentation or when a person chooses to disclose their gender identity to others. Being visibly trans, either by gender expression or disclosure, clearly provides an avenue for anti-trans bias to emerge and increases the likelihood of experiencing violence.

As previously discussed, other factors that increase risks overall, such as being economically marginalized, participating in survival economy activities, and having unstable housing, may also contribute to some trans people's increased violence risk. However, violence experiences appear to be quite common across demographic groups overall, with some trans groups bearing greater frequency or severity depending on these specific vulnerabilities. Like many other forms of violence, lower-income trans people are more likely to report experiencing violence than higher-income individuals. But, unlike violence generally, the reported acts of violence against trans people disproportionately occur in public, such as in transit waiting areas (e.g., bus stops, train stations), on the street, or in parking areas. In public urban spaces, a common form of harassment and violence is dubbed "walking while trans," in which visibly trans people, particularly trans women, are stopped and harassed by the police under the assumption that they are sex workers. These stops sometimes escalate from verbal harassment to acts of violence and/or sexual coercion.

An important factor in whether and where a crime occurs is the availability of victims, and in the case of violence against trans people, those who are more out, figuratively and literally, in the public and who are "visibly trans" may face heightened risks of experiencing violence. However, given that many trans people report violent victimization from family members and intimate partners, often separate from other forms of violence, more research is needed to determine whether public or private spaces hold greater risks for trans

people. Some preliminary data suggest stronger family ties may be a protective factor against experiencing violence, while people who have been expelled from their families of origin or struggle with those relationships may be more likely to experience violence. It is presently unclear if those additional reports of violence are due to violence perpetrated by family members or if the lack of social support and protection provided by a family leads to additional exposures and risk.

Perpetrators of the Violence

As with other types of crime, more information is available about the victims of violence than the perpetrators. Research demonstrates that the perpetrators of violence against trans people are disproportionately male, as is common in all types of violent crime. However, a greater proportion of anti-trans violence involves groups of perpetrators, rather than someone acting alone. In addition, a larger percentage of the perpetrators of violence against trans people are strangers to them than is the case for cis people. But this finding must be interpreted with caution, since violence within family systems (such as being charged with "child abuse") is often counted and treated separately than other forms of violence (such as charges of "assault").

Analyses of acts of violence identified as bias crimes against trans people suggest that perpetrators often conflate sexuality and gender identity (e.g., accusing trans women of being gay men), express multiple biases (such as race/ethnicity, sexuality, and gender identity biases) in their verbalizations during an attack, and/or find glee in harming trans people as a form of entertainment or sport. Prior research on bias crimes in general suggests that the violence against trans people is often not driven by one motive alone; rather, there are likely many types of perpetrators who target trans people for different reasons.

One defense seen in the courts, called the "trans panic defense," hints at a motive for the murder of trans women in particular. This defense is based on a defendant asserting that the discovery of someone being a trans female was so provoking that, in the "heat of passion," he murdered the victim. This claim has most often been applied in cases where a cis man was intimate with, or attracted to, a woman he assumed was cis but later discovered was trans. The defense exposes the cultural biases related to masculinity and the demands of "being a man" that preclude men from being attracted to trans women. Also underlying this argument is the idea that the use of violence against trans women for their gender transgressions is a "normal" response of a "typical" cis man to recover from the perceived threat to his masculinity. Thus, the perpetrators of violence against trans people may do so for their own individual reasons (e.g., bolstering self-esteem, enhancing a sense of their own masculinity) or for more social reasons (e.g., to reinforce a binary gender system, to "punish" transgressors). Perhaps more than any other area related to violence against trans people, more research is needed to understand the motives of perpetrators and the factors related to their victim selection.

The Effects of Violence

Experiencing violence has been found to be significantly related to a variety of negative physical health and mental health outcomes. Numerous studies of trans people who report having experienced any incidence of violence have found that they are at an increased risk for depression, anxiety, posttraumatic stress symptoms, and psychological distress, and they are more likely to engage in risk-taking behaviors, such as using/abusing alcohol and other drugs and having unsafe sex. Some studies that measure frequencies of violent victimizations have suggested an exposure–response relationship—that is, each incidence of anti-trans violence may increase the risk for negative physical and mental health outcomes, although these findings are preliminary. One particularly disturbing finding is the consistent relationship between experiences of anti-trans stigma and violence and suicidal ideation and attempts. In most research samples and in most of the countries studied, trans people report rates of suicidal ideation and attempts that are significantly higher than those for cis people. In addition, the constant threat or experience of violence causes many trans people to feel psychologically distressed and be worried that they will be victims of violence or die at a young age because of their gender identity. Many trans people also internalize negative messages about their gender, which can make them

more likely to accept violence as "normal" in their social and intimate relationships and less likely to recognize that what has been done to them is a form of violence and to report it to officials.

Experiencing violence has also been found to have a negative effect on trans people's social lives, including decreasing their willingness to go outside at night and to go to certain neighborhoods, as well as leading them to adopt protective behaviors, such as carrying a weapon when in public and refusing to go out alone. Because trans people, especially individuals who are visibly identifiable as trans, are potentially more at risk in public spaces, many limit their use of these spaces or are more cautious when outside. These behavioral changes are reported more frequently among trans people who have directly experienced violence but can also be common among trans people who learn of other trans people experiencing violence. Thus, anti-trans violence is both an individual and a community experience, and the negative physical and mental health effects of violent victimization can be experienced by trans people who did not experience the violence themselves. Research also seems to suggest that experiences of violence may harm trans people's relationships with others, including being a trigger for relationship dissolution with significant others, relationship strain, or relationship challenges within a family.

Although negative consequences have been more extensively studied, experiencing violence or other forms of bias-motivated conduct has also been found to lead to positive life changes or outcomes for some trans people. For example, after being victimized, a trans person might become more involved in LGBTQIA+ or trans groups or activities, participate in political action or organizing efforts, or mentor other trans people or seek to be mentored. On a larger scale, an act of anti-trans violence in a community can result in members of that community feeling marginalized and devalued, or it can lead to people finding ways to resist and organize, enabling them to regain a sense of power and control in their communities, rather than feeling the need to hide or limit their ability to participate in public life. The fact that some positive outcomes may result from violence clearly does not justify violence in any way, but it does show the ways that trans people and communities have built resilience and strength over time in the face of often lifelong exposure to violence and violence risk. Thus, violence not only affects individuals but can also affect the formation and resilience of entire communities of trans people.

Structural Violence

Policies or societal structures can also enact violence against trans people. A number of countries criminalize crossdressing or gender-nonconforming behavior or use laws against same-sex sexual relationships to persecute trans people. Many more jurisdictions, including more than half of U.S. states, allow discrimination based on gender identity in employment, housing, and public accommodations by not having trans-inclusive nondiscrimination policies. Additionally, many jurisdictions in the United States are seeking to further erode the rights of trans people, such as by preventing them from using the public restroom that matches their gender identity, participating in high school sports, and accessing or affording transition-related medical services. Taken together, these structural factors can lead to many of the same negative outcomes as the other types of violence described above: poor mental health, internalized oppression, a limitation of freedoms, and additional harms, like being unable to maintain employment or housing. These forms of structural violence may also help explain other negative outcomes in research on trans people, such as increased rates of homelessness or housing insecurity, greater participation in survival economic activities (including drug dealing and selling sex), and higher levels of unemployment and food insecurity.

Implications

While the prevalence of violence against trans communities and people should be of concern on its own, there are additional implications of the research on anti-trans violence. In terms of social implications, the fact that trans people alter their behaviors in public spaces in ways that frequently limit their freedom means that trans and cis people do not have the same opportunities to meet and interact with each other. In particular, the self-protecting behaviors that remove trans people from public life, such as not going out and avoiding particular neighborhoods, serve to eliminate the possibility of cis people interacting with, building relationships with, and learning about their trans community members.

While most people have intersecting identities that mean they must negotiate which spaces are safe and which are not, trans people bear this additional burden, and the consequences are shared by all of us.

From a social perspective, the research on violence against trans people exposes the ways that misogyny and patriarchy continue to exist in many cultures across the globe and remain destructive to anyone who violates gender norms. While tremendous strides have been made in the past decade toward increasing the visibility of trans people and challenging cultural constructions of gender as a binary, the ongoing prevalence of violence against trans people suggests that even more work needs to be done to reconceptualize gender in inclusive ways.

Last, as with other bias-motivated crime statistics, this body of research shows how cis people are creating the problem for trans people—that violence itself is not a condition inherent to being trans but one that is created and perpetuated by others. Ultimately, resolving the problem of violence against trans people lies in others' willingness to challenge their own understanding of gender in healthy and inclusive ways while sending clear messages that violence based on someone's gender identity is not to be tolerated.

Voice Training

Binary trans people (trans men, trans women) frequently request voice training from speech–language pathologists (SLPs). Achieving an authentic vocal presentation congruent with their desired gender presentation is often central to their psychosocial well-being and quality of life. In turn, having those they interact with attribute their gender in

line with their desired gender, and vocal presentation is also important to their life satisfaction, mental health, and personal safety. Nonbinary trans people also seek voice training, although not to the same extent as binary trans individuals.

SLP literature on the voices of trans women has increased dramatically since the first publications on voice and voice training for these women in the late 1970s, albeit with most of this growth taking place since the late 1990s. This literature addresses issues such as the potential impacts of voice on everyday life and well-being, tools for voice-related assessment, voice training techniques and approaches to service delivery, the effectiveness of such intervention, and factors associated with the outcomes of training. Despite this substantial literature, the quality of the underpinning research needs to be strengthened.

In contrast to the substantial volume of literature on the voices of trans women, there is a dearth of SLP literature relevant to the voices of trans men and scant mention of voice and voice training for nonbinary people. Although there is little published research on voice and voice training for trans men, the small number of articles that present qualitative and mixed-methods research related to these men is of high quality.

Until around 2015, conceptual and theoretical formulations for voice and voice modification for trans people were virtually nonexistent. Prior to that time, SLPs and clients drew mainly on sociolinguistic research conducted in the 1930s to 1960s that focused on differences between cisgender (cis) female and male voice characteristics (i.e., voice markers of speaker sex). Fortunately, theoretical models relevant to voice training for trans people began to be articulated from 2015 onward (e.g., biological determinist, constructionist, and sociocultural mediation views of voice production and a more complex biocultural transdisciplinary model articulated in 2020 by David Azul and Adrienne Hancock). Researchers also began to investigate the voice features most salient to perceptions of speaker gender in trans and cis individuals, and social change led to a more comprehensive conceptualization of gender diversity and voice production. The purely binary categorization of gender became less common in the SLP literature, with voice production beginning to be viewed as a complex and dynamic communication practice influenced by both the speaker and listener. A range of biophysiological, environmental, and sociocultural factors, as well as the practices of SLPs and other health professionals, are also recognized as contributors to voice production.

Voice Training for Trans Women

Because estrogen therapy has no known impact on vocal fold anatomy or physiology in trans women, voice training is the primary approach to assisting these women to attain a more gender-congruent voice. Voice feminization surgery using vocal fold shortening procedures (e.g., glottoplasty) can be a valuable adjunct to voice training, particularly when the trans woman is unsatisfied with the change achieved in voice training or when she desires a reduction in the need to consciously control voice pitch. High-quality evidence from studies of voice markers of gender, voice features most salient to perceptions of speaker gender, and the voice change goals of trans women suggest that behavioral voice training target increasing average pitch (fundamental frequency) to approximately 180 Hz (i.e., the average fundamental frequency typically used by cis women) and feminizing vocal resonance characteristics (i.e., increasing the frequencies of the first four formants or resonances of the vocal tract by, for example, changing tongue position and/or lip spreading). Modifying both pitch and resonance has been shown to be more effective than targeting either aspect of voice alone. There is also evidence, albeit more tentative, indicating that maintaining pitch within the range of 140 to 300 Hz, increasing “forward” resonance, increasing both the upper and lower limits of the pitch range, using a “lighter” voice quality, increasing intonational variability (e.g., by increasing the proportion of rising tones while decreasing falling and level tones), and avoiding glottal fry in conversational speech, will increase the likelihood of the trans woman achieving a more gender-congruent voice. It is important to note, however, that the applicability of these targets is likely to vary depending on individual cultural, linguistic, and social factors as well as the woman’s other voice, speech, language, pragmatic, and nonverbal communication characteristics.

Studies of the effectiveness of voice training for trans women are limited to quasi-experimental studies without randomization and observational case series studies. These studies mostly used similar voice training techniques aimed at increasing average pitch, improving breath support and body posture for voice production, reducing laryngeal and perilaryngeal muscle tension, feminizing intonation patterns, and increasing forward and head resonance. Results demonstrated that average pitch, formant frequencies, the proportion rated by listeners as female, and self-ratings of voice femininity increased. Levels of satisfaction with voice training and voice outcomes were also high. Overall, there is moderately strong evidence for the effectiveness of behavioral voice training, but this conclusion needs to be accepted with caution because of studies' methodological limitations, inadequate long-term follow-up, and wide individual variability in outcomes. In addition, the prognostic indicators of successful voice interventions are unclear.

Voice Training for Trans Men and Nonbinary People

In contrast to the lack of effect of hormone therapy on the voices of trans women, testosterone therapy for trans men is expected to result in desired voice changes such as lowering of pitch and masculinizing vocal resonance characteristics due to an increase in muscle bulk and thickness of the vocal folds. Until the mid-2000s, hormone therapy for trans men was viewed as comparable to typical pubertal growth of the vocal folds and larynx experienced by cis males. As a result, many trans men and health care professionals assumed that voice production difficulties were minimal and that voice training was not warranted for this group of trans people. It was not until around 2014 that high-quality studies of the vocal situations of trans men were published. High-quality studies have now demonstrated that many trans men are not satisfied with the vocal outcomes of hormone treatment. Many experience vocal concerns such as inadequate pitch lowering; diminished voice quality, vocal endurance, and pitch range and flexibility; and testosterone treatment, which can have negative effects on vocal functioning. As a result, misgendering by others still occurs. SLPs have therefore begun to provide voice services for trans men, and a handful of clinical researchers have reported on the outcomes of voice training for this large group of trans people. Those few reports are promising, but the level of evidence for the effectiveness of voice training for trans men remains low. Similarly, voice masculinization surgery using procedures that aim to loosen the vocal folds or increase the bulk of the folds to decrease pitch has received little research attention.

Voice training for nonbinary people has received even more limited attention in the voice literature. Some SLP clinicians have begun to provide services for this diverse group, but no high-quality research has been reported as of mid-2020. It remains unclear how the targets and content of such voice training should be determined, although the likelihood of wide variability in the voice goals of these trans people and a desire for increased vocal flexibility and production of an authentic voice provide some guidance to clinicians. Furthermore, no voice training studies of even moderate quality have been published; only anecdotal, expert opinion, and case study literature is available.

Emerging Considerations for Voice Training in Trans People

Intersectionality is beginning to be considered in trans voice literature given that trans people are often multiply marginalized (e.g., via their trans status, being simultaneously unemployed/underemployed, and being socially disconnected and/or unsupported). Discrimination, disadvantage, and violence are common to this multiply marginalized group. The impacts on the process of, and access to, voice training and voice support are therefore substantial. Voice training for trans people is not prioritized in most health and social care systems, and some SLPs do not view working with trans people as core to their health care roles.

W

Women's Colleges

The subject of trans students' inclusion at women's colleges is one that has animated vigorous internal and public debates, protests, and policy changes since at least the early 2000s. The issue began to gain prominence as an increasing number of students came out as trans men while attending women's colleges. The conversation then grew to include trans female and nonbinary students. As understandings of gender have broadened and deepened beyond the rigid binary in North America in the early 21st century, women's college students, alumnae/i, faculty and staff, administrators, and trustees have had to reevaluate their frameworks for thinking about gender. In so doing, they have had to determine what the implications are for colleges dedicated to the education of women.

Trans students, alongside their queer and feminist cis student allies, have lobbied and protested against trans exclusionary admissions policies at many women's colleges. These actions have often resulted in these policies being changed to allow for a greater inclusion of trans students. Going forward, women's colleges will need to grapple not only with which populations marginalized by gender should be allowed to apply to a women's college (i.e., whether to admit just trans women, trans women and nonbinary individuals assigned female at birth, or all trans people) but also how trans students are treated in every aspect of campus life.

Women's Colleges and Trans Inclusion: Historical Background

Women's colleges began in the United States in 1837 with the opening of Mount Holyoke Female Seminary in Massachusetts, now known as Mount Holyoke College. These schools were designed as institutions where (mostly white) women could receive an education at a time when higher education was a pathway open only to white men. Not to be confused with finishing schools or "charm schools," which focused on social etiquette and attracting husbands for wealthy white women, women's colleges have historically emphasized a rigorous academic curriculum. The Seven Sisters schools of the Northeast—originally comprising Barnard, Bryn Mawr, Mount Holyoke, Radcliffe, Smith, Vassar, and Wellesley—were established as the female equivalent of the then all-male Ivy League.

As previously male-only colleges and universities increasingly began to admit women during the 20th century, and as women made key legal gains (e.g., Title IX in 1972, formal workplace harassment protections under Title VII in 1980), enrollment at women's colleges dropped. Many of the schools were forced to close their doors or begin admitting men to maintain financial solvency. This trend continues today, evidenced by Pine Manor College in Massachusetts becoming coeducational in 2014 and Sweet Briar College in Virginia almost closing in 2015. Sweet Briar has remained open, after a backlash from students, alumnae/i, and

faculty led to a major fundraising push and lawsuits against the college's closing. Many current students and graduates of women's colleges, who have experienced their colleges as crucial for centering and building female empowerment, leadership, and academic excellence, are strongly opposed to their alma maters admitting male students. Because of this history, the issue of trans students at women's colleges has been especially fraught.

Arguments for and against admitting trans students to women's colleges often involve discussions of privilege and oppression related to gender and race. For example, some women's college community members have questioned why anyone male identified would want to attend a college established for women. According to these critics, any slot taken by a male student would be one less available to a woman who would benefit from the colleges' focus on female leadership. Allegations of white male privilege have often surfaced when discussing the presence of trans men at the mostly white-dominated campuses. Some women's college administrators have also voiced concerns that admitting students other than cis women would jeopardize their institution's unique protections under Title IX, even though the colleges that have enrolled trans students have not had their funding challenged.

Arguments against trans women's place on women's college campuses have tended toward questioning their status as female. Those opposed to trans women's inclusion have often contended that the applicants should be required to have already undergone gender-affirming bottom surgery. Trans advocates have countered that this focus on genitals unfairly implies that trans women pose a similar potential threat to cis women as do cis, heterosexual men under rape culture. Trans women and their allies argue that trans women deserve to have their safety considered as well, especially given the high rates of violence, particularly sexual violence, inflicted on trans women. Advocates for trans women also point to the considerable financial and health system barriers that limit the access of trans female teens to gender-affirming surgery, especially if they do not have familial support. On a more basic level, proponents of admitting trans women have asserted that any college designated "for women" must embrace *all* women. Those who seek to include trans women at women's colleges reject what they consider the trans exclusionary radical feminist (TERF) rhetoric driving many of the arguments against trans women's inclusion.

Activism for Trans Inclusion

At Smith College in Northampton, Massachusetts, the growing visibility of trans men on campus in the early to mid-2000s—including the participation of one student in the 2005 Sundance Channel documentary *TransGeneration*—accelerated debates about trans students at women's colleges, albeit with a focus on the experiences of trans men. Other women's colleges also began having similar discussions at this time. As more and more trans men started publicly coming out, often with the support of the LBQ student communities at their women's colleges, they found that campus administrators seemed reluctant to fully embrace them as members of the college. They also faced hostility, microaggressions, and overt discrimination from other students, faculty, and staff, such as students glaring at them in residence halls, professors refusing to use the right pronouns in classes, and being deadnamed at graduation. To combat these forms of discrimination, trans students and allies formed groups to support each other and to push for change.

Trans women were not as prominent in the debates about who "counted" as being able to attend a women's college until the fall of 2012, when a young trans woman named Rose Wong applied to Smith College. Her application garnered national media attention after Smith rejected her application, telling her she could not be considered for admission because her father had marked "male" on her federal financial aid form. Those coming to Wong's defense were incensed by the Smith administration's "case-by-case" approach to trans female applicants, arguing that there should be a uniform policy allowing trans women to apply. Wong's allies also pointed out the classed dimension of her being rejected based on a financial aid form, wondering whether she would have been considered had her family not needed to apply for financial aid.

After the Wong debacle, Smith students formed the group Q&A (said to stand for Queers & Allies) to advocate for an across-the-board policy

for trans women's admission. Q&A delivered a 4,000-signature petition in support of trans women to the Smith admissions office in May 2013 and continued protesting through the next school year. In a large-scale display of solidarity in April 2014, about 200 students signed up for shifts to take turns participating in an all-day rally on behalf of trans women outside the Smith admissions office. In May 2015, the Smith Board of Trustees—facing yet another protest—finally voted to admit trans women.

Meanwhile, other women's colleges were beginning to change their admissions policies in favor of admitting trans women. In the late summer of 2014, Mills College in Oakland, California, became the first to categorically include trans women in its admissions policies. Mount Holyoke followed closely behind that September. As more and more prominent women's colleges changed their policies, this put more pressure on those that had not, and student activists were emboldened to press their case even harder. As of 2020, 21 U.S. women's colleges will admit trans women based solely on those women's self-identification, and trans men are eligible to apply to six of the schools without restriction. Five campuses allow nonbinary applicants to apply, although two of those five specify that the nonbinary applicant must be assigned female at birth.

Who Is Included?

U.S. women's colleges vary in how they conceptualize and implement their missions in today's multigendered world. Some colleges, like Hollins University in Virginia and Smith College, accept trans women but not trans men or nonbinary students, in accordance with their identities as women's colleges. In contrast, schools like Mount Holyoke and Agnes Scott College in Georgia accept applications from any prospective student who is not a cis man. From 2007 to 2019, Hollins required enrolled students who realized they were trans men to leave the college, a policy controversial among students and alumnae/i until its repeal. Bennett College, Converse College, and Stephens College still do not permit students who transition to male while on campus to graduate from their schools. Even though these colleges essentially ban trans men from campus, they continue to have students who realize that they are trans after enrolling, thereby undermining the assumption that all students at a women's college are women.

A consensus remains elusive on whether women's colleges should admit only women—cis and trans—or whether, in line with their historical purpose of elevating those marginalized by their gender (i.e., cis women), they should extend their inclusion to everyone whose gender is minoritized. Accordingly, many current students of the historic Seven Sisters colleges now refer to the schools instead as the "Seven Siblings." At the same time, many students, including some trans students, strongly feel that admitting people who do not identify as women to a women's college undermines the unique importance of these spaces for women. They also argue that admitting trans men and nonbinary people to a so-called women's college delegitimizes the genders of those who are truly *not* women.

While trans men have been at women's colleges in increasingly visible numbers since the beginning of the 21st century, attention to the needs and experiences of nonbinary and trans female students has been more recent. Women's colleges are increasingly being called on to put into practice the values indicated by their mission statements and admissions policies and address the needs of trans students for safety, dignity, respect, and the experience of being fully integrated into the campus community. These aims must also take into consideration the other identities and subject positions that trans students (and cis students) bring with them, including race, class, sexuality, religion, nationality, and disability. Trans students and their cis allies at women's colleges are urging their campus administrations to increase trans course content, hire trans faculty, bring more trans speakers to campus for talks and workshops, and develop awareness trainings for faculty, staff, and administrators on how best to support the gender diversity of their students.

Women's Movement, Trans Inclusion In/Exclusion From

The women's movement has had complex and often contrary views of trans people, particularly trans women, and their place in the movement. The question is not whether the movement should include trans women, as trans women were a part of the early feminist groups and helped create feminist and lesbian feminist cultures, but how the movement has responded to their presence. The ways in which feminists and feminism in general have addressed trans people rests on a sexed ontology—whether one asserts that sex is constructed or natural. It is this analytical divide that is absolutely fundamental to understanding how and why many radical feminist opinion leaders and organizations braved violence in order to be inclusive of trans women, as well as how and why sex essentialist activists who self-identify as "radical feminists" with a "gender critical" analysis are embraced by the likes of the Heritage Foundation and are financially supported by antiabortion hate groups.

Trans realities challenge ontological systems that see sex as natural and unchanging, which has inspired acts of ontological safeguarding. While some sex essentialist activists were primarily concerned with routing out trans people from the women's movement in the name of "radical feminism," early radical feminists rejected *ad naturam* (from nature), reductionist, and essentialist understandings of "woman." For instance, whereas Simone de Beauvoir famously asserted in 1949 that women are made rather than born, Ruth Herschberger attacked the very notion of a discrete body binary in 1948, noting that sexed body attributes exist on a spectrum and do not, in reality, present themselves in discrete binary sets. Herschberger's and other early social constructionist analyses informed the theoretical foundation of what became the radical feminist dialectic of the 1970s women's liberation movement, inspiring the likes of Monique Wittig, Andrea Dworkin, and Catharine MacKinnon to reject the notion of a natural, discrete, and unconstructed body binary. Table 1 indicates similarities and differences between radical feminist, trans feminist, and trans exclusionary radical feminist (TERF) analyses.

By the mid-1970s, a surge of prescriptivist ontologies, rooted in sex essentialism, had created a violent split within the women's liberation movement, inspiring some sex essentialist feminists to act out their ontological safeguarding upon feminist spaces and trans bodies. The primacy of sex essentialism led to violence, including attempted murder; the breakup or near breakup of several feminist organizations; and a largely successful attempt to end access to trans medical care within the United States.

The Liberation Divide

The women's liberation movement has had a long and painful history of exclusion. In the 1960s,

Table 1 Differences Between Radical Feminism, Trans Feminism, and TERFism

	Radical Feminism	*Trans Feminism*	*TERFism*
Sex	A political group defined by their material condition within society	A spectrum of sexed attributes regarded as genotypic and phenotypic ontologies	An essentialist-based body binary naturally existing outside of culture
Gender	The sexed experience	Personal: gender orientation, identity, and expression Cultural: gender roles, stereotypes, and hierarchies	Sexism
Analysis	Materialism	Queer	A reductive essentialism colloquially known as "Gender Critical"
Opinion leaders	Andrea Dworkin, Monique Wittig, Catharine MacKinnon, John Stoltenberg, Simone de Beauvoir	Sandy Stone, Leslie Feinberg, Emi Koyama, Susan Stryker, Kate Bornstein, Julia Serano	Janice Raymond, Mary Daly, Germaine Greer, Robin Morgan, Sheila Jeffreys

Source: Author.

lesbian women were excluded from the women's liberation movement, as they did not embody the type of "woman" that concerned mainstream feminism. Specifically, the National Organization for Women (NOW), then led by Betty Friedan, began excluding lesbian individuals, groups, and concerns because she viewed sexuality and women's oppression as distinct issues. However, a group of protesters, including some who would later become trans identified, organized themselves as the Radicalesbians and protested NOW's exclusionary feminism by distributing a "Woman-Identified Woman" manifesto that decoupled "woman" from middle-class heteronormative ideas of womanhood. As lesbian women gained inclusion within the women's liberation movement, other subgroups of women likewise began confronting issues of exclusion within feminism.

Perhaps the first feminist opinion leader to substantially take up the issue of exclusion faced by trans women was Andrea Dworkin. In her first book, *Woman Hating* (1974), Dworkin recounted a conversation she had with a trans woman friend. In her retelling, Dworkin noted that exclusion seemed to be the "primary emergency" facing trans women. Within the context of Dworkin's analysis, the term *primary emergency*" represented the injury of main concern to different subgroups of women. For instance, a Jewish woman in Nazi Germany would be oppressed as a woman, but her primary emergency would be a product of the anti-semitic oppression she faced. She likewise applied this intersectional analysis to Black women, American Indian women, and, of foremost concern to this analysis, trans women. In this regard, Dworkin noted that while her trans friend was oppressed as a woman, her "primary emergency" was an all-encompassing exclusion from both society and the movement to liberate women from oppression. Dworkin's analysis of what is known today as intersectionality led her to condemn the experience of exclusion, support access to trans medical care, and suggest that the trans experience undermined the sexism that defined the material experience of all women.

Dworkin's intersectional analysis was likewise shared by foundational feminist organizations and opinion leaders. Radical feminist legal scholar

Catharine MacKinnon, whose work on sexual harassment is foundational to the workplace protections of women, noted that her legal career began with advocating for a trans woman stuck in a men's prison. Iconic radical feminist organizations, such as the Olivia Collective, Sisters, the *Lesbian Tide* Collective, and the Daughters of Bilitis, were likewise inclusive of trans women. In fact, the Olivia Collective, a lesbian separatist organization known for pioneering women's music in the 1970s, paid for transition-related medical care for one of their members. And while out trans woman singer and activist Beth Elliott was the subject of verbal assaults and an attempted physical attack by sex essentialist feminists when she took the stage at the 1973 West Coast Lesbian Conference, which she had helped organize, most attendees voted twice for her to continue to perform, and she received a standing ovation when she did so. Elliott, who had been elected vice president of the San Francisco chapter of the Daughters of Bilitis before being pushed out by newer, anti-trans members, had also been included in the 1971 Gay Women's Conference in Los Angeles.

For feminists who understood "woman" to be a sexed class defined by one's material condition within society, the liberation of cis women could not happen without the liberation of all women, including intersex and trans women. For feminists who understood "woman" to be a discrete object defined by nature or god(s), "woman" was a class to be reified and protected. Sex essentialist activist Janice Raymond argued that trans women were not human in the way she was; instead, Raymond asserted that trans women were dangerous and decaying synthetic products that siphoned off women's creativity, spirit, and energy and that their nonnatural status served to hide their true male natures. Taking such objectifications further, Mary Daly stated that trans women were monstrous; Germaine Greer contended that trans women were like serial killers who murder their mothers, Robin Morgan declared that trans women were like rapists who wear blackface, and Sheila Jeffreys maintained that trans women violate the human rights of cis women when they use public restrooms and that the vaginas of trans women stink. However, at a University of Cambridge presentation, Greer proclaimed that trans women were not women because their vaginas did not smell bad enough.

Obloquy aside, in the same way racists access an illusion of empowerment by objectifying themselves as a racial ontology, some subgroups of women involved in the women's liberation movement likewise fought not for the destruction of their sexed class but for its reification as an ontology central to their spirituality, community, and selfhood. For these women, trans women embodied a challenge to their ontological dependence and responded by investing decades of time and attention into rooting out, stigmatizing, and ostracizing trans women. Some notable expressions of this ontological safeguarding include the public assaults of trans-supportive radical feminists Robin Tyler and Patty Harrison; the beating of the iconic trans activist Sylvia Rivera for attempting to speak at the 1973 Christopher Street Liberation Day rally; forcing the closure of the Sisters Collective and Cell 16's training space for being trans inclusive; organizing a national boycott against the Olivia Collective for having an out trans member, Sandy Stone; and attempting to murder Stone. Ginny Berson, cis cofounder of both The Furies and Olivia collectives, described the effects of the 1970s-era anti-trans activism she encountered as being harmful, malicious, and fundamentally foolish.

Perhaps the most destructive outcome resulting from the work of anti-trans activists was the issuance of a ban on trans medical care by public and private insurers. Janice Raymond's 1979 book, *The Transsexual Empire: The Making of the She-Male,* a work rooted in the ethics of *ad naturam* argumentation, together with a report Raymond created for the government regarding the ethics of trans health care, was used by the Reagan administration to justify prohibiting public insurance programs from covering transition-related health care as ethical. Once the ban went into effect, private insurers, citing the federal government's policy, likewise banned trans health care. Decades later, a State of California review of such exclusionary policies found that barriers to trans care constituted, more than any other variable, the most significant predictor of suicide in the trans population.

Throughout the 1990s and 2000s, the Michigan Womyn's Music Festival came to embody the split between trans-supportive feminists and anti-trans activists after the festival expelled Nancy Burkholder, a trans attendee, in 1991. In 1992 and

1993, cis lesbian feminist Janis Walworth began an education and outreach effort, which included conducting a survey of 633 festival attendees that found nearly three fourths wanted the Womyn's Music Festival to be trans inclusive. However, festival security informed her that, owing to threats of physical violence, her proinclusion activities would need to be moved outside of the festival. Although a group of cis leather dykes volunteered to provide festival security, Walworth's group, wishing to avoid violence, set up an education and outreach tent across from the festival gates that became known as Camp Trans. In later years, the camp was facilitated by the Lesbian Avengers, who faced threats of knifing and other violence from sex essentialist festival activists.

As controversy around the festival intensified, online feminist spaces expanded, and it was out of one of these virtual spaces that, in 2008, the term *trans exclusionary radical feminist,* or TERF, was popularized by cis feminist Viv Smythe. Smythe noted that her community was overrun by virulently anti-trans activists who referred to their anti-trans hate as "radical feminism." Since this feminist space included radical feminists who were either trans supportive or neutral, Smythe began using "TERF" to distinguish between the anti-trans activists who were new to the space and the radical feminists who had been part of her online community. As the term *TERF* was propagated online, sex essentialists responded by launching a "TERF is a slur" campaign in 2013 to discourage the term's uptake within feminist discourse. At the same time, sex essentialist activists began colonizing the queer terminology *gender critical* as a euphemism for their anti-trans beliefs. While in its pre-2013 queer context, *gender critical* referenced a trans-inclusive, antisexist analysis of gender, the term has come to be closely associated with anti-trans sex essentialist activism.

Workplace, Gender Transition

Since the 1990s, it has become increasingly common for trans people in the United States to openly transition on the job. In previous decades, trans people were more likely to transition in private and seek a new job in alignment with their gender—trans men in male-dominated occupations such as construction and trans women in female-dominated occupations such as office administration—where no one knew about their history. Trans women were advised to practice living on lower salaries in preparation for this transition due to the gender wage gap as well as having to hide their work history. Fast forward to the mid-2000s and beyond, and open workplace transitions have become so common that there is now extensive industry advice on best practices for human resource professionals and career development practitioners working with trans-identified and/or transitioning clients. However, most of the research to date on gender transitions in the workplace predominantly reflects

the experiences of white, binary trans people. Future research is likely focus on the workplace experiences of trans people of color as well as nonbinary people, especially given evidence that trans people of color experience higher rates of employment discrimination and economic insecurity.

Workplace Disclosures and Transition Plans

Not all trans people elect to disclose their identity at work. For some, particularly gender-nonconforming people and those who do not "pass," hiding who they are is not an option. Depending on their level of comfort, some may disclose to their boss and to human resources staff but not to colleagues. Opting not to disclose may be motivated by a sense of privacy and/or a desire to avoid discrimination. Fear of discrimination also leads some to delay transitioning on the job. One study found that those who stayed in the same job after transitioning waited 7 years longer to disclose than those who changed jobs after transitioning. Another study reported that nonbinary participants delayed disclosure longer than binary participants did. When making plans to disclose and/or transition on the job, many trans people research how others have handled workplace transitions, confirm their legal rights, and make decisions about whom first to approach (e.g., human resources, supervisor, union official). Some carefully craft a coming-out letter and work with human resources to educate their colleagues.

In several studies, trans respondents shared that their workplace transitions went better than expected, expressing relief along with greater job satisfaction and self-efficacy following transition. Many respondents attributed such positive feelings to their coworkers' acceptance and support. In expressing their support, some coworkers reinforced hegemonic gender norms as well as heteronormativity, regardless of the trans person's sense of gender and sexuality. Trans men found themselves asked to help move heavy objects and included in "guy talk" such as sexual banter while trans women were invited to cosmetic shopping trips and "girl talk" such as children and fashion. Although there has been very little research on the workplace experiences of nonbinary people, the emerging literature on nonbinary social experiences in general indicates that nonbinary people often feel pressured to conform to gender norms. Nonbinary people may present accounts of themselves that mirror dominant narratives that do not align with their actual sense of self in order to be seen as "trans enough."

Differing Experiences of Trans Men and Trans Women at Work

Trans women have also been found to transition, on average, 10 years later than trans men (in their 40s compared to their 30s), which some researchers attribute to the desire to prolong the advantages of working as men. As reported in a qualitative study by Bender-Baird, Audrey, an IT professional from the Midwest, attributed her six-figure income to an extensive work history, including corporate leadership positions, as a man pretransition. However, when Audrey was ready to transition, she was working as a corporate IT director for a small, private company. Audrey believed it would have been impossible for her to transition in such a visible position and instead found her way to a lower-paying position with a different company. Like Audrey, many trans women experience a decrease in earnings posttransition. One study found that average earnings for trans women fell by nearly one third while the average earnings for trans men increased slightly following transition. These dynamics, which reflect patriarchal norms, also appear when posttransition trans women are seen as less competent by colleagues while trans men are seen as more competent. Additionally, trans women risk accusations of gender inauthenticity if they display valued workplace characteristics like confidence and authority, which are gendered masculine. However, not all trans men tap into the same patriarchal dividend. For instance, shorter trans men and trans men of color generally do not receive the same workplace advantages posttransition as tall, white trans men.

Employment Discrimination

Many trans people report high levels of distress and anxiety around workplace disclosure, with some reporting suicidal ideation and others feeling transitioning at work is not possible. One source of such anxiety is the high rate of discrimination trans

employees face. Since the 1990s, community-based studies have found high rates of employment discrimination among trans people, including harassment, job loss, denied promotion, and failure to hire. A matched pair experiment found that half the test employers failed to hire the trans job applicant while extending a job offer to the non-trans applicant. Nonbinary trans people are less likely to be unemployed than binary trans people but more likely to be denied a promotion. Trans people of color consistently report higher levels of employment discrimination. When they are not fired, many trans people face mistreatment at work, including lack of access to appropriate bathrooms, being referred to by the wrong name and/or pronoun repeatedly and on purpose, being forced to present in the wrong gender in order to retain jobs, and being asked inappropriate questions.

As reported in one study, Carey, a college instructor in the Northeast who transitioned on the job, requested to send an email to colleagues, asking that they refer to him using his new name and pronoun and leave it to him to disclose this information to students. However, Carey's supervisor refused to circulate the email, claiming it was an inappropriate use of the faculty listserv and equating it with looking up pornography on an office computer. Such an equation implies that being openly trans in the workplace is inappropriate and perpetuates the sexualization of trans people. Because Carey was not protected by any workplace policy, he did not pursue a formal complaint.

Legal and Policy Protections for Trans Employees

A second source of anxiety is the existing patchwork of legal and policy protections, which leave many trans workers vulnerable. A psychological study found that legal protections may act as a buffer between discrimination and trans people's self-perception of being able to make career decisions while facing barriers. As of 2020, there exists no U.S. federal statute providing explicit protections for trans workers. Although introduced into nearly every Congress since 1994, legislation prohibiting employment discrimination on the basis of sexual orientation or gender identity has yet to become law. In 2019, the House of Representatives passed the Equality Act, which has a legislative history stretching back to 1974, adding gender identity and sexual orientation to the Civil Rights Act and expanding the definition of sex to include sex stereotyping. Such expansion follows the arc of jurisprudence coming out of the 1989 U.S. Supreme Court *Price Waterhouse v. Hopkins* decision, which established sex stereotyping as actionable sex discrimination. Since 2004, federal courts have begun interpreting federal sex discrimination laws to cover trans plaintiffs. Additionally, as of 2019, 21 states plus Washington, D.C., Puerto Rico, and Guam have passed laws explicitly prohibiting discrimination in employment and housing based on sexual orientation and gender identity.

Such legislative and judicial movement has pushed private companies to adopt trans-inclusive nondiscrimination policies. As of 2020, 98% of the more than 1,000 companies rated by the Human Rights Campaign provided employment protections on the basis of gender identity, up from 5% in 2002. Accompanying the spread of employment protections is growing public support for trans workers and their rights. In a 2017 survey published by the Williams Institute, nearly three in four respondents supported antidiscrimination protections for trans people, and a majority believed the United States should do more to support and protect trans people.

With greater social support and legal protections, more trans people may feel comfortable disclosing at work. Unless there is a restructuring of the workplace, trans people will likely be incorporated into existing workplace gender norms. Further research is needed to understand the full diversity of trans experiences at work. The workplace transitions of nonbinary people remain understudied. Furthermore, the experiences of trans people of color, beyond rates of discrimination, are largely left out of the conversation. The sociological literature on gender and work—based on cisgender men and women—consistently reports different patterns of employment for people of color.

WORKPLACE CLIMATE

Workplace climate refers to qualities of a workplace environment that shape the experiences of employees of that organization. Formal aspects of the workplace climate may include organizational policies or practices that govern overtime requirements, provision of benefits, or protection from workplace discrimination. Alternatively, workplace climate may reflect employees' subjective perceptions that they are valued and supported by the organization as a whole or by parts of the organization (e.g., one's supervisors or coworkers). Most adults who have the ability to work (i.e., barring major disability and/or chronic illness) and who are able to attain work do so and spend approximately 90,000 hours at work over their lifetime. It is perhaps unsurprising, then, that workplace climate affects the emotional, interpersonal, and economic well-being of all workers, regardless of their sociocultural background. However, given that workplaces are themselves embedded in societies, systems of privilege and oppression that are endemic to those societies—like cissexism, sexism, racism, or heterosexism—shape the workplace climates that employees occupy. This entry will define workplace climate and discuss aspects of the workplace that may be particularly salient for trans employees. Subsequently, scholarship documenting the impact of positive and negative workplace climates on the well-being of trans employees is discussed. The entry concludes with recommendations for how various stakeholders could improve workplace climate for trans employees.

Defining Workplace Climate

Workplace climate manifests in both formal and informal ways. Formal indicators of workplace climate include organizational policies or practices that shape employees' perceptions that they are valued. Such policies or practices could directly influence employees' economic, personal, or professional well-being by providing them with financial stability (e.g., reliable employment, adequate compensation), medical benefits, family supportive policies (e.g., leave time to care for sick children), flexible work schedules, or opportunities for training and advancement within the organization. Alternatively, the formal aspects of workplace climate could also shape how employees are treated at the job through transparency in retention, dismissal, or promotion processes; provision of timely, constructive feedback; or resolution of interpersonal conflict between colleagues. Workplace climates are considered more positive

when policies are fair and applied to employees similarly regardless of their demographic background. Formal antidiscrimination policies may be particularly effective for creating equitable workplace climates.

Workplace climate may also be communicated via interpersonal interactions. Employees feel more positively about the workplace when they believe that other members of the organization—coworkers and supervisors—value their work contributions and are invested in their well-being. Conversely, abuse, mistreatment, or interpersonal discrimination from others in the workplace lead to more negative evaluations of the workplace climate. Because supervisors tend to be perceived as more representative of the organization as a whole by virtue of their authority, their behavior is likely more influential on perceptions of workplace climate.

Workplace Climate for Trans Employees

A sizable and growing area of scholarship has documented trans employees' perceptions of workplace climate. Much of this research focuses on anti-trans workplace discrimination, a manifestation of negative workplace climates. The 2015 United States Transgender Survey (USTS) included data from 27,715 trans people living in all 50 states, the District of Columbia (D.C.), and U.S. territories. Seventy percent of the total sample had held or applied for a job the prior year, and 27% of these individuals reported that in the prior year, they had been denied employment, denied a promotion, or fired because of their gender identity or expression. Furthermore, 15% of all respondents who were employed in the prior year had been verbally harassed, physically attacked, or sexually assaulted at work because of their gender identity or expression. Almost a fourth (23%) of participants who had been employed in the prior year reported experiencing one or more other forms of mistreatment, including being forced to use a restroom that was not consistent with their gender identity, being forced to conceal a trans identity in order to retain employment, or having a supervisor or coworker disclose information related to their trans identity without permission.

Some research with trans employees has operationalized workplace climate as the presence or absence of policies or practices that are supportive of trans employees. For example, organizations could enact a policy that explicitly prohibits discrimination based on gender identity or gender expression or could include gender identity and gender expression in their definitions of diversity. Organizations could also address gender identity and gender expression in workplace diversity trainings or provide trans-specific resources or support groups to employees. Research with trans employees suggests that a common concern is access to restrooms that are consistent with their gender identities. Thus, guaranteed, safe access to restrooms may be a salient component of supportive workplace climates for trans employees. Finally, given that half of people in the U.S. receive health insurance from their employers, it is vital that organizations provide access to insurance plans that cover trans-affirmative health care, such as hormone replacement therapy or gender affirmation surgeries.

Having such policies in place can be particularly important for trans employees given their lack of legal protection. Federal laws—such as the Civil Rights Act of 1964 and the Americans With Disabilities Act of 1990—explicitly prohibit employment discrimination on the basis of race, color, religion, sex, national origin, or disability throughout the United States. No federal law explicitly ensures analogous protection from employment discrimination on the basis of gender identity, gender expression, or sexual orientation. This is somewhat offset by the fact that 21 states and the District of Columbia prohibit discrimination on the basis of gender identity (an additional seven states prohibit gender identity discrimination against public employees).

There have been legislative efforts to expand federal workplace protections to explicitly ban gender identity–based discrimination since 2009 (similar efforts to prohibit sexual orientation–based discrimination have been unsuccessfully introduced to Congress since 1974). On May 17, 2019, the U.S. House of Representatives passed the Equality Act, which would amend the Civil Rights Act to ban sexual orientation– and gender identity–based discrimination in employment, as well as other areas such as housing, education, access to federal funding, and credit. But the U.S. Senate did not vote on the legislation.

The question of whether or not extant civil rights law may be interpreted to prohibit workplace discrimination against trans and sexual minority employees has received scrutiny in the past decade. For example, in May 2015, the Equal Employment Opportunity Commission—the U.S. federal agency that administers and enforces workplace nondiscrimination civil rights law—interpreted prohibition of sex-based employment discrimination provided by Title VII of the Civil Rights Act as covering gender identity– and sexual orientation–based discrimination. This policy was reversed in October 2017 by the Department of Justice under U.S. Attorney General Jeff Sessions. This followed a July 2017 announcement by President Donald Trump that trans individuals would be banned from serving in the military, which several LGBTQ advocacy groups challenged in court, and which was then reversed in 2021 by the Biden administration. On June 15, 2020, the U.S. Supreme Court issued a ruling on the case *Bostock v. Clayton County, Georgia* that affirmed that Title VII's prohibition of discrimination based on sex necessarily also prohibits discrimination based on gender identity and sexual orientation. This landmark decision effectively provides trans and sexual minority employees across the United States with legal protection from workplace discrimination.

The Impact of Workplace Climate on Trans Employees

Workplace climate is closely associated with multiple facets of well-being for trans employees. Perceptions of positive workplace climates are associated with important career outcomes, such as greater job satisfaction and organizational commitment, and lower job anxiety and intentions to quit. Similarly, more supportive workplace climates are associated with greater satisfaction with life, an indicator of psychological well-being. With regard to interpersonal outcomes, positive workplace climates are associated with greater coworker and supervisor support. Furthermore, positive workplace climates are associated with greater disclosure of one's trans identity. Importantly, models of identity development for sexual or gender minority people generally posit that greater openness about one's identity promotes well-being by allowing for greater personal authenticity and closer, more supportive interpersonal relationships. One interpretation of the association of positive workplace climates with greater openness is that supportive climates allow trans employees to feel safe sharing their identities—which, due to cissexism, tend to be stigmatized—with colleagues. In turn, more openness about one's trans identity in the workplace is itself associated with better career and mental health outcomes.

Research has also examined the association of negative workplace climates—most often operationalized as perceptions of anti-trans discrimination in the workplace—with important outcomes. Importantly, positive workplace climate and workplace anti-trans discrimination tend to be moderately to strongly negatively correlated, which suggests that they tap into the same underlying construct. Workplace discrimination is negatively associated with job satisfaction, work volition (the perceived ability to make work-related choices), perceived employee–organization values congruence, life satisfaction, coworker support, and disclosure of trans identity. It also seems that trans employees are well aware of the potential negative impact of discrimination on their lives: More than three fourths of employed trans people in the USTS sample reported taking steps in the prior year to avoid workplace discrimination, including hiding their gender identity (53%), hiding the fact that they had already transitioned (25%), delaying their gender transition (26%), or even quitting their jobs (15%).

It is also important to consider the potential economic impact of workplace climate on trans employees. The ability to attain and retain work that provides the economic resources necessary to meet basic material needs—food, clothing, housing—is likely suppressed for trans people who encounter hostile workplace climates. The difficulty trans people have attaining decent work may account for why 24% of USTS participants kept a job for which they believed they were overqualified. Furthermore, the unemployment rate among participants in the USTS sample (15%) was three times the national average. This disparity was particularly pronounced for American Indian/Native American, Black/African American, Latinx, Middle Eastern, and multiracial participants (as compared to white/European American participants), which may reflect the dual, intersecting influence of racism and cissexism in the lives of trans people of color. Such high

levels of unemployment likely influenced the fact that 29% of participants in the sample were living in poverty, which was more than twice the national average (12%). Given difficulty accessing decent work, it is perhaps unsurprising that 20% of the USTS sample reported participating in criminalized work (e.g., sex work, drug sales) at some point in their lives. Again, reflecting the intersection of multiple systems of privilege and oppression, trans people who were undocumented, women, and/or people of color were particularly likely to work in the underground economy.

Improving Workplace Climate for Trans Employees

Workplace climate is associated with the career, emotional, interpersonal, and economic well-being of trans employees. Thus, it is vital that organizations create workplace environments, policies, and practices that support rather than marginalize gender minority employees. In 2016, the Human Rights Campaign published *Transgender Inclusion in the Workplace: A Toolkit for Employers* to serve as a resource for organizational leadership, management, organizational consultants, and human resource professionals seeking to create trans-affirmative workplace climates. Through individual counseling, vocational psychologists or career counselors may help trans employees explore the potential influence of poor workplace climates on clients' career development and well-being. In addition, these professionals may help clients identify organizational (e.g., human resource professionals) or community (e.g., civil rights organizations) resources to address organizations that are resistant to positive change. The recent extension of workplace nondiscrimination law to trans employees is a remarkable development that should improve the likelihood that trans employees are treated with the dignity they deserve.

Workplace Policies

More than one in four trans people in the United States has been fired due to anti-trans bias and more than three in four trans workers nationally have reported workplace discrimination due to their gender identity and expression. Even more

than 50 years after the passing of the Civil Rights Act in 1964 (a federal bill prohibiting employment discrimination based on sex, race, color, national origin, and religion), trans people continue to face issues in the workplace, often manifested as refusal to hire, privacy violations (i.e., being "outed" as trans at work), harassment (i.e., bullying, violence, and mistreatment from employers and coworkers), and elevated rates of unemployment, poverty, and economy distress.

One reason such disparities exist is the continued lack of consistent *workplace policies:* laws and protocols established to both support trans people in the workplace and prevent anti-trans discrimination. As of 2020, 32 states (including Washington, D.C.) and over 200 local jurisdictions have instituted at least one such policy prohibiting discrimination based on gender identity. Similarly, hundreds of private employers have instituted trans-affirming policies that make the workplace safer for trans people by creating gender-neutral bathrooms, providing insurance coverage for gender-affirming medical procedures, and creating trans employee affiliation groups. Yet there is a continued need for inclusive, federal trans-affirming workplace policies, particularly to support multiply marginalized trans people (e.g., trans people of color, trans women, and those working in informal sectors that are not government regulated such as gig work, sex work, and home-based labor). As such, legal advocates are working with government agencies and community affiliates to codify the Equality Act: an amendment to the Civil Rights Act to nationally protect against discrimination based on gender identity and gender expression.

Toward a National, Trans-Inclusive Antidiscrimination Policy

After years of working at a funeral home in Livonia, Michigan, a funeral director named Aimee Stephens informed her boss in 2013 that she was beginning to live her truth as a woman at work. Stephens had been living as a trans woman outside work and wanted to present authentically at work with her employer and with clients by following her company's dress code for women on the job. Soon after writing a letter to her boss, however, Stephens was fired. This clear act of anti-trans workplace discrimination led to a groundswell of support not only for Stephens but also for trans people nationwide who continue to face harassment, discrimination, and elevated rates of unemployment due to bias and marginalization. Backed by the Equal Employment Opportunity Commission (EEOC), the federal agency that enforces workplace nondiscrimination laws, Stephens sued her former employer. In 2018, the U.S. Court of Appeals ruled against the funeral home, citing Title VII of the Civil Rights Act of 1964, which states that people cannot be fired on the basis of sex. The case was appealed to the U.S. Supreme Court, which issued a ruling on June 15, 2020, affirming the lower court decision that Title VII's prohibition of sex discrimination includes discrimination based on gender identity, as well as discrimination based on sexual orientation.

Even with the ruling in the Stephens case, the extent to which national laws render anti-trans discrimination illegal remains unclear. An example is the varied interpretation of the Americans With Disabilities Act (ADA), a civil rights law codified in 1990 that prohibits discrimination against people with disabilities in all areas of public life, but which explicitly excluded "transsexualism" and "gender identity disorder" as disabilities. However, in 2017, a federal district court ruled a trans employee could proceed with a discrimination claim under the ADA. Kate Lynn Blatt, a trans woman working at a hunting and fishing retailer, claimed she faced workplace discrimination as well as retaliation due to anti-trans bias. The court ruled that Blatt's gender dysphoria substantially affected her ability to maintain activities of daily life, thus rendering her legally disabled and protecting her from discrimination. Although many trans advocates problematize the notion that gender dysphoria should be considered a disability, activists continue to fight to codify protections for gender identity and expression through the fight for consistent, national antidiscrimination policies.

Trans-Affirming Workplace Policies in the Private Sector

Policies for trans workers in the private sector have historically manifested in two ways: (1) through instituting antidiscrimination policies that prevent anti-trans discrimination and (2) through enacting policies and/or structural changes to a workplace

that render it safer and more supportive of trans employees. In 2019, 85% of *Fortune* 500 companies had adopted gender identity nondiscrimination policies, up from only 3% in 2002. Furthermore, 62% of these corporations offer trans-inclusive health care as compared to 0% in 2002. While these figures are encouraging, Bureau of Labor Statistics data indicate only 17% of the approximate 27 million U.S. workers were employed by one of these companies in 2015. Because aggregated data from other major firms and small businesses concerning this matter are not readily available, it is difficult to characterize private sector policies.

Although the percentage of workplaces without trans nondiscrimination policies remains unknown, several studies have detailed a range of discriminatory workplace practices experienced by trans individuals. Trans people may work for companies that have gender-stereotypic uniform policies and may be required to wear attire that does not align with their gender identity. Changing one's legal name and gender marker on identification documents can be challenging, and the option to have a nonbinary gender marker is rare. Employers may require trans employees' legal name and sex assigned at birth to be used on company-issued documents and other forms of communication. Such practices represent a delegitimization of trans people's identities and increase the likelihood of an employee being outed. Gendered environments have commonly been identified as points of contention for trans persons and their employer, with many trans workers reporting being prohibited access to restrooms or locker rooms and/or experiencing assault in such environments. Negative reactions from coworkers are the most frequently reported complaint among trans employees in the private sector. Moreover, some companies' policies on appropriate dialogue in the workplace limit one's abilities to discuss issues affecting trans workers.

Although hundreds of companies report implementing strategies to ensure policies, benefits, and workplace culture are trans affirming, fewer businesses are familiar with strategies to support nonbinary trans employees. This is a critical step given nonbinary individuals report elevated rates of discrimination, with almost one in three reporting discrimination even in the hiring process. One contributing factor may be gender binary policies and practices, such as the need for employees to use a single-gender bathroom, limited use of gender-neutral pronouns, restrictive gendered dress codes, and the use of onboarding documents for human resources that ask future employees to identify as "male" or "female." Recommendations for nonbinary-affirming workplace policies include the following: provide employees with options beyond male and female on paperwork, remove gendered language from policies (i.e., replace "his/her" with the singular "their"), and allow employees to use gender-neutral prefixes (i.e., Mx.) and pronouns (i.e., they/them), and their chosen names on human resources documentation and client-facing nametags. Gendered facilities can also put nonbinary people at further risk of discrimination, which can be mitigated through the use of ADA-compliant, gender-neutral language and pictograms on bathroom and locker room doors.

Enacting Workplace Policies to Support Multiply Marginalized Trans People

A critical step toward trans inclusion and support in the workplace is supporting multiply marginalized communities, including trans people who also have racial, class, religious, and other identities that are met systemically with discrimination and marginalization. One key example is the mistreatment of working-class trans employees. Indeed, some trans employees working for companies with top-tier trans-inclusive policies have noted that they have been outed by managers, misgendered, misnamed, and denied the full benefit of trans-affirming health care benefits. These reports often come from lower-paid employees who tend to work in service delivery (i.e., custodial staff, retail workers, and public-facing employees) rather than from people working at the corporate level. These findings suggest that inequity in access to certain positions in the workplace is a critical factor in determining trans individuals' employment experiences. Unequal opportunity for employment attainment may be particularly damaging for trans people of color, with unemployment among trans people of color approximately four times that of the national average and nearly double that among trans populations in general. African American trans people report poorer employment-related outcomes than white trans people.

Misogyny, or systemic marginalization of women, also plays a role in the persistence of

issues for trans women in the workplace. The confluence of prejudice against women *and* trans people is often referred to as transmisogyny and creates further barriers for trans women to access vocation support and success. In the United States, studies reveal that trans women face harsher levels of discrimination in the workplace than trans men. One study, for example, found that trans men tend to earn more money posttransition, whereas trans women's earnings tend to fall by nearly one third after presenting as women at work. This dichotomy highlights pay disparities as work between men and women, which also manifest between trans people to marginalize trans women in particular. Similarly, trans men often receive more favorable performance evaluations after transitioning. This has been described in the literature as a *double dilemma,* whereby trans women are subjected to biased behaviors based on both their trans identity and negative gender stereotypes toward women. This is supported by data suggesting trans women who are posttransition experience elevated harassment from supervisors, often rendering work in the formal sector untenable or impossible.

Barriers to employment and high prevalence of workplace discrimination are often a major factor in trans women's decision to engage in sex work. Many trans women report sex work is their only viable option for survival; others describe positive experiences. Because sex work is an unregulated, criminalized industry, trans people engaged in sex work are at risk of violence and incarceration. Additionally, legal injunctions against sex work give merit to moralistic negative social views toward sex workers, which perpetuate violence against trans women involved in the sex work industry. These findings highlight the elevated vulnerability for bias-based abuses trans women face in all areas of work.

Recommendations for Trans-Affirming Workplace Policies

In 2002, the Human Rights Campaign (HRC) launched the Corporate Equality Index (CEI), which presented benchmarks for evaluating workplace climates for gender and sexual minority employees. The CEI considers several criteria: policies banning mistreatment based on sexual orientation, gender identity, and/or gender expression; equivalency between same- and different-sex spousal and domestic partner benefits; provision of trans-affirmative health care coverage; a supportive and inclusive culture; and corporate social responsibility.

Workplaces can create a supportive culture by educating employees about forms of anti-trans discrimination; incorporating gender identity and expression into diversity and cultural competency trainings; creating gender transition guidelines for employees and management with guidance regarding access to restrooms, dress code, and documentation; and collecting workplace climate data. Workplaces can demonstrate corporate social responsibility by actively recruiting trans employees, advertising within trans communities, donating to organizations that support trans rights, and voicing public support for laws affirming trans people's health and rights.

In 2016, the HRC published *Transgender Inclusion in the Workplace: A Toolkit for Employers*. This toolkit educates employers about workplace experiences of trans people, advocates for trans-affirmative workplace climates, and provides concrete guidance to evaluate policies and practices. Taken together, CEI and the toolkit work to inform the public, employees, human resource professionals, and top management about the best ways to enhance the workplace experiences of trans employees.

World Professional Association for Transgender Health

See WPATH.

WPATH

The World Professional Association for Transgender Health (WPATH) is a nonprofit, interdisciplinary medical and educational association that was organized by a small group of physicians, mental health professionals, researchers, and trans people who were concerned with the type of gender variance that, in the 1970s, was associated with the term *transsexualism*. Over the next 40 years, the group slowly expanded its membership, began taking public positions advocating for the health and human rights of trans people, and initiated professional continuing education aimed at increasing access to gender-affirming health care globally. Incorporated in 1979 as the Harry Benjamin International Gender Dysphoria Association (HBIGDA), the group convened biennial international meetings to share knowledge about the diagnosis and treatment of trans people. It also developed the first Standards of Care (1979), which have since evolved to become a globally powerful instrument supporting trans health and human rights.

Scholars and practitioners from fields that affected trans health—predominantly surgery, endocrinology, internal medicine, urology, gynecology, mental health, and law—who were mostly based in Western Europe and North America began holding educational meetings in 1969. These meetings were sponsored by the Reed Erickson Educational Foundation, a trans-led organization, along with different educational institutions. At the Fourth International Conference on Gender Identity in 1975, organizers named the conference after Dr. Harry Benjamin in recognition of his 90th birthday and his pioneering research on transsexuality in the United States. With the Erickson Educational Foundation ceasing operations, attendees at the Fifth International Gender Dysphoria Symposium in 1977 formed HBIGDA and named the group in his honor.

The first version of the Standards of Care (SOC), which was approved by the attendees of the Sixth International Gender Dysphoria Symposium and published in 1979, was 9 pages long and focused on hormones and gender-affirming surgeries for "gender dysphoric persons." By establishing its own ethical and clinical guidelines, HBIGDA hoped to legitimize trans health care and bring professional respect to the field, and thus it firmly linked the standards to the diagnosis of "Transsexualism" in the American Psychiatric Association's *Diagnostic and Statistical Manual, Third Edition* (*DSM-III;* 1980).

The second version of the SOC, published in 1980, rescinded a guideline from the first version that required candidates for hormonal therapy to have successfully lived "full-time in the social role of the genetically other sex." This expectation, which was referred to by trans people as the "real-life test," was a significant barrier for some people who sought to transition. However, the extent to which this and other guidelines limited access to treatment was overstated by many trans activists, as very few health care providers at the time were even aware of the standards, much less following them.

The third and fourth versions of the SOC, published in 1981 and 1990, respectively, loosened

the qualifications needed by the mental health professionals who evaluated trans clients. Whereas previously only licensed psychologists and psychiatrists could recommend hormone therapy and gender-affirming surgery, the new criteria enabled any clinical behavioral scientist with a minimum of a master's degree to do so in an effort to expand access to care. Nevertheless, the criteria for access to hormones and especially to surgery remained strict.

The fifth version, released in 1998, was renamed "The Standards of Care for Gender Identity Disorders," which reflected the diagnostic nomenclature being changed in the *DSM-IV* (1994) from "Transsexualism" to "Gender Identity Disorder." At the HBIGDA Scientific Symposium in 1997, trans protesters demanded and received entry to the membership meeting in which the proposed fifth version was to be discussed. More than 20 trans activists objected to the lack of content related to transmasculine people, and a "consultant" was appointed to suggest appropriate modifications. However, it was not until the sixth version in 2001 that the SOC began to reflect a greater comprehension of transmasculine experiences and medical needs. The sixth version also included the concept of harm reduction in a nod to the Informed Consent Model of access to care. The Standards Committee that worked on the sixth version included trans professional members, which gave trans people greater input than was afforded to the earlier "consultants."

HBIGDA changed its name to WPATH in 2007 in order to reflect its focus on the health of trans people and to indicate that it did not view being trans as a disease condition. This emphasis was also made explicit in the seventh version of the SOC in 2011. WPATH leaders subsequently worked with the American Psychiatric Association to replace the diagnosis of "Gender Identity Disorder" with "Gender Dysphoria" in the *DSM-5* (2013) and worked with the World Health Organization to replace "Transsexualism" with "Gender Incongruence" in the *ICD-11* and to move the diagnosis from the mental health/paraphilias section to a new physical health chapter.

Attendance at HBIGDA biennial scientific symposia throughout the 1990s averaged between 300 and 400 professionals, with a slowly increasing number of trans participants, who were either medical professionals or community health advocates. Symposia locations generally alternated between Europe and North America. In 2014, the symposium was held in Bangkok; attendance increased to more than 500 and membership increased to more than 700. In 2015, WPATH began offering professional training sessions in partnership with various hospitals, clinics, and health care organizations through a Global Education Initiative. WPATH also created regional chapters, which were encouraged to hold their own conferences in the years between the international symposia. In 2016, the symposium in Amsterdam drew over 1,000 attendees, double the organizers' expectations, and by the end of 2019, association membership numbered nearly 2,500.

Youth and Teens, Legal Issues

Over the past 50 years, the transgender rights movement has made tremendous progress, expanding legal rights through litigation and legislative advocacy as well as increasing social awareness and acceptance. Despite the relatively fast pace of those gains, there are still many obstacles to formal equality and making that equality a lived reality. This is particularly true for trans young people, whose rights are under continual attack by legislators and government agencies, and in the media. This entry provides an overview of current legal protections that safeguard the rights of trans young people while highlighting areas of law that are still developing.

Bostock and Its Background

The U.S. Supreme Court's decision in *Bostock v. Clayton County, Georgia* (2020) was a watershed moment for the transgender rights movement and one that significantly improved the lives of trans people overnight, including trans young people. Prior to *Bostock*, federal courts across the country had consistently held that federal laws prohibiting sex discrimination protect transgender people. Nevertheless, employers, schools, hospitals, and other entities covered by those laws continued to disclaim any liability for discriminating against trans people. *Bostock* unequivocally dismissed those claims, holding that discrimination against trans people is necessarily a form of sex discrimination. The opinion also set an important example for courts when interacting with trans people. Throughout the opinions, the justices referred with dignity and respect to Aimee Stephens, a trans woman who had been fired for being trans. The majority's opinion used her correct name and female honorifics when referring to her. Even the dissenting opinions referred to Ms. Stephens by her last name only, a convention those opinions applied equally to each litigant.

Although *Bostock* focused on Title VII, a federal employment discrimination law, the Supreme Court's decision touched all federal laws that prohibit sex discrimination. Of importance to trans young people, *Bostock* reaffirmed that federal laws protect trans people from discrimination in schools and health care. Having those protections has significant practical effects on the daily lives of trans young people.

Title IX, the federal law that prohibits schools from discriminating based on sex, prohibits schools from engaging in actions or enforcing policies that discriminate against trans students or allow harassment—from either teachers or students—that creates a hostile school environment. For example, courts have repeatedly held that school policies that exclude trans students from accessing the facilities consistent with their gender identity violate Title IX. Federal courts have also unanimously rejected claims that permitting trans students to access those facilities would violate the rights of non-trans students. But Title IX applies to more than access to restrooms. Title IX would also prohibit schools, for example, from denying a trans applicant admission, preventing a trans student from enrolling in a class,

or placing additional requirements on a trans student as a prerequisite to participating in a school activity based on their transgender status. Like discrimination, harassment and bullying of trans students can take many forms, including persistently using the wrong name and pronouns when referring to the student, calling a trans student derogatory names, and inappropriately touching or physically assaulting a trans student. The key in each of those examples is that the school's actions—or failure to act—denies a trans student equal access to educational opportunity.

In the context of health care, Section 1557 of the Affordable Care Act protects transgender people from discrimination by health care entities that receive money from the federal government. This requirement applies to doctors' offices and hospitals as well as insurance companies. Courts have held that mistreating trans patients—whether by ignoring typical examination protocols because a patient is trans or by repeatedly using the incorrect pronouns when referring to a trans patient—violates federal law. Section 1557 has also been the basis for striking provisions in health insurance plans that exclude coverage for treatments that are medically necessary for trans people. Insurance companies are also not permitted to deny coverage for routine medical care because the patient is trans, including coverage for annual gynecological care for trans male individuals. To comply with Section 1557, insurance companies are increasingly eliminating or limiting the scope of exclusions for gender dysphoria treatments, increasing the ability of trans people, including young people, to access medically necessary care.

Federal law prohibits sex discrimination—and thus discrimination against trans people—in many other contexts, too. For example, federal law prohibits discrimination in housing, including access to homeless shelters, and in banking, including decisions to extend lines of credit such as home loans. There is currently no federal law that prohibits sex discrimination in public accommodations, which would include stores, restaurants, hotels, and other businesses. In 2019, the U.S. House of Representatives passed the Equality Act, a bill that would extend existing antidiscrimination protections to include sex discrimination in public accommodations. That bill has not yet been considered by the U.S. Senate.

Constitutional and Statutory Protections

The U.S. Constitution offers trans young people another layer of legal protection from mistreatment by local, state, and federal government entities. Those protections emanate principally from the Equal Protection Clause, First Amendment, and right to privacy. Under the Equal Protection Clause, the government cannot discriminate against trans people without having at least an "exceedingly persuasive justification" for the differential treatment. Laws and governmental policies that discriminate against trans people have failed to meet this high standard. In fact, in many of those cases, courts have held that the government was unable to provide even a rational basis to support its discriminatory treatment of trans people. The anti-trans bills that have been debated in state legislatures across the country, including criminalizing the provision of medical treatments for gender dysphoria and excluding trans athletes from sports, also run afoul of this basic constitutional principle, as a "desire to harm a politically unpopular group cannot constitute a legitimate governmental interest." Both the First Amendment and right to privacy give trans young people control of when and with whom they share their trans status. For example, a school district could not require a trans student to inform their classmates that they are trans, nor could the school district discipline a student for sharing that information.

A growing number of states are strengthening the legal protections available to trans young people through their state constitutions, statutes, and agency policies, creating yet another layer of legal protections. Many states have their own antidiscrimination laws. Some of those laws mirror the federal protections discussed above, but others provide even greater protections. For example, state antidiscrimination laws often include a prohibition on discrimination in public accommodations. Those laws can also apply to entities that are not covered by federal law, such as schools and health insurance companies that do not receive federal funds. States that have antidiscrimination protections commonly issue guidance documents through state agencies (e.g., a department of education, department of insurance) to help ensure compliance with those laws. Guidance documents provide critical information to entities subject to state laws regarding how to comply with

those laws. They also provide important resources such as model policies and official sources for additional information and support.

Trans people have also been successful in obtaining additional legal protections through federal and state statutes that prohibit discrimination based on disability. Qualifying for protection under those laws requires having a condition that impairs a major life activity or bodily function, which includes, for example, caring for oneself, learning, concentrating, working, or proper endocrine function—a standard that gender dysphoria easily satisfies. Using those laws, trans young people have challenged discrimination in schools and in government-run foster homes and have also obtained necessary educational services to enable them to access their curriculum. Although those claims have been less prominent in the trans rights movement, those claims have resulted in critical victories that have extended protections to trans young people living in states that do not have trans-inclusive antidiscrimination laws.

An area of state law where trans people, including young people, experience significant discrimination is in the patchwork of statutes, regulations, and policies surrounding the correction of gender markers on government-issued identity documents. Even with an increasing number of states modernizing their record keeping for birth certificates, many states still require trans people to undergo surgical treatment to correct the gender marker on their birth certificate. That requirement prevents many trans people from obtaining a birth certificate that accurately reflects their identity and is particularly onerous for trans young people who are unable to access surgical care and who rely heavily on their birth certificate as a form of identification. Courts have consistently concluded that state laws that prohibit any corrections to the gender marker on birth certificates are discriminatory against trans people. States that require surgery create a similar barrier for trans young people that exposes them to psychological harm and unnecessarily discloses their trans status to strangers, increasing the likelihood that they will experience mistreatment or physical violence because they are trans.

Nonbinary individuals seeking an "X" gender marker also experience significant barriers to obtaining accurate identity documents. Many government-issued identity documents—both state and federal—do not even provide an option for a nonbinary gender marker. This too, however, is rapidly changing, with increasing numbers of state agencies expanding gender marker options to include a nonbinary option.

Trans young people are also more regularly finding themselves at the center of custody disputes between their parents who disagree on whether to affirm their child's gender identity and whether to seek appropriate treatment for their child's gender dysphoria. When making custody determinations, family court judges are guided by the "best interests of the child" standard, but an unsupportive parent's use of fear, misinformation, and misconceptions about trans young people can often distort that analysis—a strategy that is often even enabled by unqualified experts and health care providers. Although courts had historically been hesitant—even openly resistant—to award custody or decision-making authority to the supportive parent, courts are increasingly recognizing that trans young people need to be affirmed for who they are and must have access to medically necessary treatments for their gender dysphoria, like any other medical condition. That trend has also resulted in many unsupportive parents becoming willing to resolve their disputes amicably, creating the possibility for them to become more supportive of their transgender child, a shift that is undeniably in the child's "best interests."

Even with these significant advancements in securing legal recognition and protections for trans young people, the work of the transgender rights movement is still unfinished. One area that courts are starting to grapple with is the extent to which the First Amendment—both the Free Speech and Free Exercise Clauses—exempts someone from complying with generally applicable and neutral antidiscrimination laws and policies. Following well-established precedent, lower courts have consistently held that educators who mistreated trans students in their respective classes were not protected by the First Amendment. Because the speech at issue was made in the context of the educator's job, the schools had the authority to discipline them for speech that violated the school's antidiscrimination policies. Those courts also held that those policies do not violate the Free Exercise Clause because the schools applied the policies neutrally to all employees.

Another emerging area that is still being explored in the lower courts is the interaction between a trans young person's constitutional right to privacy and the constitutional rights of their parents. For example, in one case, a parent sued her teenage daughter and the daughter's medical providers, among others, alleging that permitting her daughter to make decisions, such as consenting to medical care and registering for public benefits, violated the parent's constitutional right to parent her child. That case was dismissed, which was affirmed on appeal. Relatedly, several state legislatures have considered bills that would require educators to disclose a student's trans status to their parents, while school districts have developed policies to protect the safety and well-being of trans students by respecting the student's need for privacy while promoting family acceptance. Although courts have repeatedly held that trans people have a right to privacy in their trans status, which should apply with equal force in the context of schools, the specific question of whether a parent's constitutional rights can compel a school to disclose a student's transgender status in violation of the student's right to privacy remains unresolved.

With *Bostock* fortifying the legal foundation for transgender equality, trans young people have many of the protections they need to thrive. Over the coming decades, the transgender rights movement is prepared to continue to advocate, strengthen, and expand those rights both in court and in policies that will help make equality a lived reality for all trans people, including youth and teens.

Youth and Teens, School Experiences

Youth spend a large proportion of their waking hours in school settings. Trans youths' experiences in school settings remain largely underrepresented in the extant literature. Notably, many of the educational studies that include trans youth do so by grouping them with youth who identify as sexual minorities (who are in turn referred to as LGBTQ). This entry specifically delineates which studies have focused specifically on the experiences of trans youth, compared with studies that describe LGBTQ youth as a homogeneous group. Similarly, studies that do focus on the school experiences of trans youth tend to do so as a homogeneous group without attention to the unique experiences of nonbinary youth (i.e., those who identify and/or express themselves outside of the gender binary) or the differential experiences of trans boys and trans girls. Important to note is that much of the research on trans youth experiences in schools has been conducted in the United States and Canada; research from trans youths' experiences around the globe is addressed when relevant. Also of note is that the research on trans youths' experiences in schools primarily focuses on high school settings rather than preschool, elementary, or even middle school educational settings, a limitation that will be discussed later in the entry.

The most comprehensive study of trans youths' school experiences in the United States is the National School Climate Survey conducted by GLSEN; this survey has been conducted every 2 years since 1999 and seeks to understand and track supportive and hostile school experiences of LGBTQ students in Grades 6 through 12. The most recent iteration of the National School Climate Survey was conducted online in 2019; the sample included more than 16,700 students in the U.S., Puerto Rico, American Samoa, and Guam, 48.8% of whom identified as trans, genderqueer, another

nonbinary identity, or questioning or unsure of their gender identity. This study is referenced throughout this entry, given that several other large-scale surveys of student experiences in schools have failed to use an inclusive measure of gender identity or expression.

Overall, the experiences of trans youth in schools are largely negative. The majority of trans youth report that they are not safe in their schools because of their gender identity or expression. This lack of safety stems from both relational experiences of bias-based victimization, harassment, and discrimination from peers or school adults (e.g., teachers, administrators), as well as from structural experiences of transphobia and cisnormativity (e.g., policies that exclude or oppress trans students). As an example, the 2019 GLSEN National School Climate Survey found that over 90% of LGBTQ students reported that they had heard negative remarks about gender expression at school, and nearly 90% heard negative remarks about trans people. These relational and structural experiences of transphobia and cisnormativity at school contribute to higher rates of absenteeism, poorer psychological well-being, decreased sense of school belonging, and lower academic achievement. Furthermore, qualitative studies of trans youth find that these negative experiences even explain some physical health disparities for trans youth, such as high rates of urinary tract infections due to the lack of access to safe and accessible restroom facilities. Beyond concurrent associations, research also finds lasting effects of bias-based victimization predicting poorer health and well-being outcomes in young adulthood among LGBTQ youth.

In sum, it is critical to understand how trans youth experience schools in order to prevent and intervene amid negative experiences, as well as more effectively foster and support positive experiences in schools for trans youth. This entry describes the relational and structural experiences of trans youth and teens in school, identifies what is known about fostering positive school experiences, and discusses future directions for research on trans youth experiences in school.

Relational Experiences in School

Relational experiences in school settings may include positive and negative interactions with peers and school personnel (e.g., teachers, administrators, monitors, bus drivers). Much of what we know about relational experiences at school for trans youth comes from research documenting their experiences of victimization, harassment, and discrimination or describing the safety net and protective impact of having supportive peer or adults. A novel area of research that just began to gain traction in the late 2010s focuses on the interaction between parents of trans youth and school personnel, such that parents may engage in school advocacy efforts to ensure or increase safety for their child.

Bias-based victimization, harassment, and discrimination represent a clear and strong risk factor for a multitude of compromised outcomes, including health, academic achievement, and psychosocial well-being. Trans youth are particularly at risk for experiencing chronic and high levels of victimization, harassment, and discrimination given that cisnormativity (social hierarchy rooted in the presumed immutability of the binary division of sex and congruence between gender and assigned sex at birth), cisprivilege (the unearned privileges that cisgender [cis] people are granted; the "normalization" of cis people, bodies, identities, and expressions), and transnegativity/transphobia (prejudiced beliefs about trans people) are pervasive systems of oppression operating in educational settings. These systems operate together to govern students' lives and punish students who violate these norms (i.e., trans students).

Indeed, the vast majority of trans youth experience bias-based victimization, harassment, and discrimination at school. A variety of surveys find that between 70% and 85% of trans students have experienced harassment and assault at school from peers on the basis of their gender identity or expression. Furthermore, over 50% of students in the 2017 GLSEN National School Climate Survey reported being referred to by the wrong name and pronoun. Beyond being misgendered or referred to using the wrong name, violence at school toward trans youth includes name-calling, threatening behavior, assault, and damage to property. As noted earlier, these experiences have negative consequences on trans youths' psychological, physical, and academic outcomes both concurrently and longitudinally.

Unfortunately, these violent experiences are not limited to experiences with peers: According to the

GSLEN 2019 survey, two-thirds of students heard teachers and other adults at school make bias-based remarks about gender. Moreover, over half of trans youth who have experienced bias-based victimization, harassment, or discrimination at school did not report the incident to school personnel because they believed that the adult would not intervene or that they would be targeted rather than assisted. Research does show, however, that trans youth are more likely to feel a greater connection to their school when they witness teachers and administrators implementing policies that are inclusive of LGBTQ youth and when they intervene in bias-based victimization, harassment, and discrimination. Thus, it is critical for school personnel to be trained in how to respond to bias-based events in their schools in timely and effective ways.

Having safe and supportive adults at school is associated with more perceived safety for trans youth. Several studies document the critical role that teacher care and connection plays in promoting school achievement and safety for trans youth. Notably, most trans youth can identify at least one supportive educator at their school. Research on teachers and frontline school health professionals (e.g., social workers, school counselors) does document that attitudes toward trans students are relatively positive. Yet, surveys of teachers and preservice teachers find that they have received little training about how to work with trans students and that knowledge of trans students is limited. Similarly, research documents that in the United States, specifically, only a small minority of school counselors, psychologists, and social workers feel confident in providing competent services to trans youth. Thus, it is critical that current and future school personnel receive professional development training on how best to serve and support trans youth in their schools.

In addition to interactions with peers and teachers, parent(s) and caregivers(s) of trans youth are becoming central advocates in schools for their children. Specifically, research documents the role that parent(s) and caregiver(s) play, particularly for younger trans students, in changing names and gender markers in school records; meeting with teachers and support staff to create transition plans, when applicable; and advocating for their students when they are experiencing violence or harmful interpersonal relationships at school. The 2017 GLSEN survey found that trans and gender-nonconforming students' (10.5%) parents were more likely to engage in school-based advocacy compared with their cis LGBQ peers (1.4%). Little is known about the effect that such parental/caregiver advocacy has on trans youths' outcomes. The 2017 GLSEN survey findings indicate that parent advocacy is associated with lower levels of depression and higher levels of self-esteem among LGBTQ students. These emerging findings as of the late 2010s indicate the promising role of parent/caregiver–school interactions.

Finally, little research has examined heterogeneity of relational experiences among trans youth in schools. A few studies have noted that trans boys were more likely to experience harassment and assault at school based on their gender expression compared with nonbinary trans youth and trans girls. However, this work is still emerging, as is research that examines heterogeneity by other sociodemographic characteristics such as race/ethnicity, (dis)ability status, or socioeconomic status. Additional research is needed to more comprehensively describe how cisnormativity in schools is experienced by different subgroups so that intervention and prevention efforts can be more effectively developed and implemented.

Structural Experiences in School

In addition to enduring negative relational experiences in school, trans students are also subject to oppressive or affirming school policies and practices that either negate or facilitate possibilities for thriving among trans students. School-related policies concerning trans youth range from national directives and protections to local school district policies about curriculum implementation. These policies include nondiscrimination polices, inclusive antibullying policies and practices, curriculum decisions and implementation, and available professional development training for school staff specific to gender identity and expression.

In the late 2010s and early 2020s, trans-related school policies dominated public discourse and debate. Perhaps one of the most defining moments for trans youth in the United States was when, in 2016, the U.S. Departments of Education and Justice released revolutionary guidelines that explicitly protected transgender students from

discrimination in schools, yet this guidance was rescinded in 2017 after the inauguration of President Trump. Notably, regardless of this guidance, Title IX in the United States is interpreted by federal courts to protect trans youth in schools that receive public funding. The Federal Equal Access Act in the United States also prohibits discrimination against students who are seeking to form a gender and sexuality alliance. Finally, the U.S. Family Educational Rights and Privacy Act (FERPA) guarantees that schools must keep information in school records, which includes gender identity, private and may not share that a student is trans without consent.

At the state and local levels, several U.S. states and local school districts have attempted to pass legislation or policies that ban trans youth from using restroom or locker room facilities that align with their gender. When trans students attend schools that have restrictive restroom or locker room policies, they report lower well-being and are more likely to report sexual assault victimization. Furthermore, legislation was proposed in several states in the late 2010s and early 2020s that attempted to ban trans students from participating in school athletics (this legislation passed in Idaho in 2020). Rare exceptions to these types of discriminatory policies do exist, but they tend to be located in more progressive locations of the United States. For example, in the early 2010s, California adopted a law that states that trans students must be allowed to use any sex-segregated facilities based on their gender identity.

From national surveys, it appears that the majority of trans students experience discriminatory policies at school. The GLSEN 2019 School Climate Survey found that the majority of trans students had experienced discriminatory policies at school. For example, students reported that their schools had policies that prevented trans students from using their chosen name and pronouns (44.5%) and from using a restroom or locker room that aligns with their gender (55.5%). More broadly, as of 2020, only 21 states in the United States prohibit bullying based on gender identity, and only 19 have laws that prohibit discrimination in schools based on gender identity; most states have neither protection for trans students.

For nonbinary youth, the school architecture is typically designed from a cisnormative perspective, such that restrooms and locker rooms are designed for men or women. Research documents that nonbinary youth are excluded from these spaces (and potentially from classes that use these spaces, such as physical education or extracurricular athletics) or they avoid these spaces due to perceived lack of safety. Curriculum is also typically constructed around gender binaries: The curriculum either denies or erases trans experiences and identities. This is particularly true in the case of sex education, where students often receive this information in segregated spaces based on gender, negating the experiences of nonbinary youth and potentially creating fear and hostility for binary trans youth.

Beyond actual policies that prevent trans youth from living authentically, trans youth are also subject to higher rates of school discipline, including detention, in and out of school suspensions, and expulsion. Emerging work demonstrates that discipline disparities by gender identity and expression are also compounded by race, ethnicity, and (dis)ability status. Additionally, many schools and districts do not have professional development opportunities or requirements for school staff focused on gender identity and expression, thereby limiting staff members' skills and knowledge regarding how best to support and affirm trans students.

Fostering Positive School Experiences

Since the early 2000s, four empirically supported methods for fostering positive school climates for LGBTQ students have been advocated for by researchers, educators, students, policymakers, and activists. They include (1) inclusive and supportive school policies, (2) inclusive curriculum, (3) access to supportive school adults, and (4) presence of a gender and sexuality alliance (GSA).

As noted earlier in this entry, the presence of inclusive school nondiscrimination and antibullying policies is associated with thriving among LGBTQ students. Best practices suggest that these policies are enumerated to specifically include gender identity and expression. These policies provide the basis for all other types of policies and practices to be effective in helping trans youth thrive in schools. Nondiscrimination and antibullying policies, as well as policies that allow for gender affirmation

(i.e., name and gender marker changes, access to gendered facilities that align with the trans student's gender), must be communicated to school staff and students in order for them to be effective. Furthermore, these policies should explicitly provide for guidance and institutional backing for staff to respond to bias-based victimization, harassment, and discrimination.

Another strategy that appears to be a robust predictor of thriving for trans youth in schools is access to trans-inclusive and related curricula. When trans students report that they learn about themselves in school and see themselves represented, they are more likely to report feeling safer, stronger connections to school, and less bias-based victimization, harassment, and discrimination. For example, the curriculum of history courses could incorporate the roles and contributions of trans people throughout history. Inclusive curriculum, such as the example provided, also allows cis students to learn about experiences and perspectives of people who experience life differently, potentially helping to create a more positive learning environment for all students.

Related to inclusive curricula, the third strategy is having access to supportive adults. Emerging intervention and evaluation research documents that professional development trainings have the potential to increase school staff's knowledge and skills related to how to support trans students and intervene in bias related to gender identity or expression.

Finally, a robust strategy for facilitating trans resilience and thriving in school includes students having access to GSAs. GSAs were originally founded to support sexual minority youth but now appear to be addressing issues of gender identity and expression. Variability exists in the activities that GSAs engage in where some primarily provide support while other provide opportunities for advocacy and leadership. It should be noted that much of the research on GSAs examines LGBTQ youth as a monolith rather than separately examining the experiences of LGBQ youth and trans youth. Furthermore, little research has distinguished or examined whether the efficacy of GSAs to predict thriving works similarly for trans youth as compared with LGBQ youth.

Future Directions for Research

Emerging research documents that there is heterogeneity within trans student populations in school experiences. Specifically, youth who identify as nonbinary or genderqueer report more hostile school experiences than do trans youth who identify and express themselves within the gender binary. Little research has examined other critical differences in trans youth experiences in schools, such as by race/ethnicity, socioeconomic status, age, or (dis)ability status. Intersectional research that examines heterogeneity in school experiences is critically needed for the development and implementation of appropriate and effective prevention and intervention programs.

Much of the research on trans student experiences in schools has focused on youths' experiences in high school. Given that many trans youth engage in social transition earlier, including as early as preschool, it is necessary to understand the school experiences of trans children and their families. It will also be critical to understand how the presence of trans youth who are open about their gender identities and expressions changes the culture of early childhood education and elementary school classrooms.

In sum, research on trans youths' school experiences is still emerging. Overall, the findings suggest that schools are sites of violence and fear for trans students. Much more nuanced information is needed for the development of multilevel interventions that respond to both relational and structural forms of cisnormativity and transphobia/transnegativity that persist in school contexts. Furthermore, this research needs to consider the enormous heterogeneity that exists within trans populations.

Youth and Teens, Well-Being

Much of the research on trans youth and teens focuses on the presence of physical and mental health burdens, such as suicidality, depression, and anxiety. Thus, the research on trans youth is often driven by understanding rates and risks of illness and health-compromising behaviors rather than examining positive experiences: namely, experiences of happiness, good health, and ability to cope with stressors. In this entry, well-being is defined as being multidimensional such that it encompasses psychological, physical, and relational domains. For the purposes of this entry, psychological well-being includes positive affect and life satisfaction, as well as abilities to cope with stressors; physical well-being includes engagement in behaviors that maintain or improve physical functioning, as well as subjective ratings of overall health; and relational well-being includes abilities to develop and maintain supportive and meaningful relationships with others. This entry discusses the main theoretical frameworks that help researchers explain well-being among trans youth, the overall state of well-being for trans youth and teens, and key factors associated with fostering resilience among trans youth.

Much of the research used to guide this entry emerged from the United States and Canada; still critically lacking is research on the well-being of trans youth globally. In turn, this entry makes note when studies have been conducted outside of the United States and Canada. It is also worth noting that much of the research on trans youth and well-being has been conducted in studies with predominantly white populations. This limitation will be contextualized in what follows, given that trans youth of color have both risk and resilience factors that contribute uniquely to their well-being (compared to what is found in predominantly white youth samples). Finally, while this entry topic is that of well-being among trans "youth" and

"teens," many studies included here have focused on the experiences of trans youth aged 14 years and older. The definition of youth for this entry includes the periods of early through late adolescence (or ages 13 to 25 years) but will also discuss, when appropriate to do so, studies of children who are trans. The developmental needs of trans children and tweens (typically conceptualized as a population between the ages of 9 and 12 years) are distinctly different from youth in adolescence and are less represented in the empirical research.

Theoretical Models

Trans youth and teens face enormous battles and barriers with interpersonal, structural, and internalized oppression. Models and studies often paint an alarming picture of the disparate compromised health outcomes (both physical and psychological) that burden trans youth populations when compared with outcomes among cisgender (cis) youth. Yet, what is often lacking in the literature is attention to the reality that the majority of trans youth do not manifest markers of compromised health (e.g., suicidality, depressive symptoms). Albeit the lack of disease or compromising health does not necessarily mean that trans youth are "well" or thriving, it does provide an opportunity to understand how some trans youth survive despite the presence of considerable barriers.

One of the key theoretical models used to understand well-being of minority populations is Ilan Meyer's model of minority stress. This theoretical model was originally developed to understand health disparities experienced by lesbian, gay, and bisexual populations and has since been adapted for use with trans populations. This adapted model of trans minority stress posits that a trans person's health and well-being are driven by minority-specific stress and protective experiences and processes. Specific to the model of minority stress, minority stressors include both distal and proximal stressors: Distal stressors include those encountered in society (e.g., victimization, oppression, discrimination) while proximal stressors include internalized forms of distal stressors (e.g., internalized transnegativity, identity concealment, expectations of rejection). These stressors are posited to affect health and well-being above and beyond any general life stressors (e.g., death of a loved one, socioeconomic stress), are chronic across the life span, and are socially rooted. Among trans youth, the most studied experiences of minority stress include school-based experiences of victimization and discrimination, parental and familial rejection and victimization, and structural stigma (e.g., laws that seek to reduce autonomy among trans youth).

In the model of minority stress, coping and social support, particularly trans community support, are hypothesized to mitigate the negative effects of these minority stressors. Thus, while studies that invoke Meyer's minority stress model are often driven by research questions examining how minority stress contributes to poor health, it is also plausible to use this theoretical model to examine how minority characteristics, such as identity integration, and coping and social support contribute to well-being. Minority stress–ameliorating factors that are most studied among trans youth from this model include coping, social support, and identity safety (or, the notion of living authentically and having identity agency in safe environments).

In addition to Meyer's model of minority stress, other research on trans youths' well-being focuses solely on experiences related to access to and use of social and medial transitions. Social transitions refer to the ability to use and be referred to by one's chosen name and pronouns, as well as youths' ability to express their gender consistent with their identity. Medical transitions, on the other hand, refer to the use of medical interventions desired by the trans youth, such as puberty blockers, use of gender-affirming hormones, and, for some youth, access to gender-affirming surgery. Given that this entry is focused on youth and teens, however, medical guidelines in the United States and elsewhere suggest that surgeries (with the exception of chest surgery for transmasculine and nonbinary youth) are not typically scheduled until the person reaches the age of consent (e.g., 18 years in the United States). Much of this literature uses a gender-affirming model of care, in which trans youth are affirmed in their gender identity via medical, familial, social, and legal interactions. Notably, the bulk of this work stems from the Netherlands, albeit this research is generally limited to research on trans youth who identify within the gender binary (e.g., as trans boys or trans girls). Research on nonbinary trans youth—or youth who identify outside of the gender binary—emerged in the 2010s and is largely situated within the United

States or Canada. Regardless, this research clearly shows that when youth desire and have access to social and medical transitions, they report better psychological and physical well-being indicators compared with those who lack this access.

In sum, Meyer's minority stress model and the gender-affirming model of care have been two of the most widely used theoretical frameworks to understand well-being among trans youth. The next section summarizes the extant literature's findings regarding psychological, physical, and relational well-being among trans youth and teens.

State of Well-Being Among Trans Youth and Teens

As noted in the introduction to this entry, much of the research on trans youth and teens is framed within a disparity perspective. Thus, while ideally this section on the state of well-being would be informed by data that stem from narratives around surviving and thriving, the data available tell narratives chiefly of suffering and illness. Also, critical to state here is the tenet that any disparity or lack of well-being experienced by trans youth and teens is not an inherent characteristic of someone who identifies as trans and/or expresses a nonbinary gender. Rather, these disparities result from oppression, as described in the model of minority stress. Thus, part of well-being refers to the person's ability to cope with, and adapt to, these minority stressors. In considering well-being, it is important to attend to psychological, physical, and relational well-being among trans youth and teens.

Psychological Well-Being

Psychological well-being includes subjective ratings of positive affect, life satisfaction, and ability to cope with stressors. Descriptions of well-being often make synonymous the presence (or absence) of well-being to mean the absence (or presence) of compromised mental health; rather than conflating these constructs, however, it is important to have a full picture of the psychological well-being of trans youth that includes both positive and negative aspects of well-being. Indeed, upon reviewing the literature, it appears that there are no comprehensive studies of psychological well-being of trans youth that have emerged from a positive youth development or resilience perspective. In turn, this entry makes note of studies that are framed in ways that deviate from the general trend to frame psychological well-being in terms of disparity.

Although few rigorous population-based comparison studies of trans and cis youth exist, those that have been conducted find that trans youth are significantly more burdened by suicidality, anxiety, and depressive symptoms compared with their cis peers. Across studies, estimates of depression range from 35% to 50%, and estimates of anxiety range from 27% to 44%. Suicidality is more frequently experienced by trans youth than by their cis peers, with 17% to 50% attempting suicide, 31% to 51% ideating about suicide, and 17% to 46% engaging in self-harm without lethal intent. Thus, up to half of trans youth across these studies have reported compromised psychological health. The other half, assuming comorbidity exists across these indicators, are not experiencing psychological distress as measured by these outcomes. Given that the slight majority of trans youth are not experiencing or reporting compromised psychological well-being, it is critical to understand predictors of absence of these indicators as well as how trans youth fare on reports of psychological well-being indicators that are positively framed.

No known population-based samples have examined positive affect or life satisfaction among trans youth. Self-esteem has largely been studied as a predictor of compromised psychological health outcomes but not as an individual outcome itself. Studies that do examine self-esteem find that trans youth report lower self-esteem than do cis youth. Studies of trans adults, however, have identified that trans adults report lower levels of self-esteem and life satisfaction compared with cis adults and that these disparities are often explained by distal and proximal minority stressors. Future research is needed to examine positive affect, life satisfaction, and self-esteem for trans youth in order to understand the prevalence of well-being among trans youth, as well as to identify predictors of well-being—rather than of compromised psychological health.

A final facet of psychological well-being is the ability to cope with distress. Much of the research in this area is qualitative and community based rather than population based. These studies highlight how trans youth might respond to minority stress in healthy ways with adaptive coping skills. One of the coping skills referenced throughout extant studies is engagement in trans-related activism. For many

trans youth, this involves self-advocacy and advocacy for other trans youth at school to help achieve equity in access and resources or to dispel stereotypes (i.e., making trans identities visible). Thus, for many trans youth, activism and self-advocacy might be a necessary strategy for resilience, surviving, and thriving. A second coping skill that has been described throughout studies is the ability to live authentically and have pride in that identity and expression. Participants across qualitative studies discussed the need to balance the need for safety with authenticity and not to feel diminished pride just because one needs to be cautious and conceal that identity in order to survive. Although these are not the only coping strategies that trans youth use to maintain or build a positive sense of well-being, these are skills that were consistent across studies. Much more research is needed that examines well-being among trans youth from a positive youth development framework rather than through a disparity lens.

Physical Well-Being

Physical well-being includes subjective ratings of overall health, as well as behaviors that maintain or improve physical functioning (e.g., nutrition, activity/exercise, sleep). Like research on psychological well-being, much of the research on physical well-being examines the absence of well-being (e.g., lack of sleep, eating disorders, lack of exercise). Furthermore, nearly all studies of physical well-being among trans populations have been conducted with trans adults rather than trans youth. In a key study published in 2018, entitled "Health and Care Utilization of Transgender and Gender Nonconforming Youth: A Population-Based Study," Nic Rider and colleagues found that only 38% of trans youth reported that their general health was very good or excellent compared to 67% of cis youth. Furthermore, they found that trans youth were less likely to receive a preventive checkup compared to cis youth. Thus, the indicators of overall physical well-being of trans youth are concerning.

Beyond general health ratings and preventative visits, the three areas that are key to physical well-being are quality sleep, balanced nutrition, and engagement in physical activity or exercise. In studies of trans adults, stark disparities are noted in sleep quality and sleep duration, and research points to minority stressors as contributors to these differences. Trans youth are also overrepresented in youth populations with eating disorders. Studies report that trans youth experience disordered eating at two to three times the prevalence of cis youth. These disparities are largely driven by unique minority stressors, as well as potentially altering eating behaviors to attempt for their physical body to align with their gender. Finally, while there have been no comprehensive studies of trans youths' engagement in physical activity or exercise, it is critical to note that many trans youth are excluded from sports and physical education classes given that they are segregated by sex assigned at birth. Thus, trans youth might engage in fewer activities because of oppressive structures that exclude them from such spaces.

Relational Well-Being

Relational well-being includes abilities to develop and maintain supportive and meaningful relationships with others. There is a lack of studies that compare trans youth with cis youth on indicators of relational well-being. Yet, research clearly details that trans youth are more likely to feel isolated and less belonging in their schools, families, and communities. Despite these disparities in social connectedness, qualitative studies find evidence that trans youth might thrive in relational well-being indicators.

For example, qualitative studies find that trans youth report that they feel more empathy for others due to their own experience of discrimination. Thus, while forming and developing relationships with others, trans youth may be able to call on their own experiences of oppression when forming relationships with others who have experienced oppression. Furthermore, empathy is a key skill necessary for maintaining healthy relationships, which may help trans youth thrive, given that social connection is one of the primary contributing factors to other domains of well-being. Similarly, given the necessity of self-disclosure of trans identity to others, trans youth report in qualitative studies that such disclosure often results in the improvement of relationship quality and strength. As a result of self-disclosure, trans youth are likely afforded more opportunities to live authentically and to share more with others, which often results in greater relationship satisfaction.

In sum, the research on the state of well-being among trans youth is generally framed in terms of health disparities rather than from the standpoint of positive youth development. This research documents striking disparities in psychological and physical well-being when comparing trans youth with cis youth. Less comparative research is available on relational well-being, and this research is critical given that qualitative research indicates plausibility for trans thriving in this domain.

Key Factors for Fostering Well-Being

Given the limited scope of the literature on well-being of trans youth, this section highlights two broad categories of factors that appear to be effective in fostering well-being: (1) identity safety and gender affirmation and (2) family support and acceptance.

Identity Safety and Gender Affirmation

When trans youth feel safe to self-disclose their identity, are seen for who they are, and are affirmed in their gender, they are likely to survive and, perhaps, thrive. Several studies now document that when trans youth are supported in their identities, via behaviors like referring to them with their chosen names and pronouns, well-being is significantly less compromised. In a groundbreaking study published in 2018, Stephen Russell and colleagues found a drastic difference among trans youth when their chosen names were used in multiple contexts compared with trans youth whose chosen names were not used (or used less often): Suicidality and depressive symptoms decreased when chosen names were used.

In educational settings, trans youth are likely to feel safe and affirmed when they are referred to using their chosen names and pronouns and are represented in school policies, practices, and curriculum. Unfortunately, many trans youth encounter bullying and harassment at school, and few trans youth report access to trans-inclusive and trans-supportive policies and resources at school. Providing access to curriculum that is inclusive of trans people and trans histories, as well as access to trans-inclusive support systems in schools, can help youth feel seen and connect to other trans people or to the LGBTQIA+ community (such as through gender and sexuality alliances), which is hypothesized as a critical resilience factor in the minority stress model.

Beyond names and pronoun usage, research on gender-affirmative approaches to health and clinical care are clearly linked with better well-being. For example, youth who are supported in their social transitions show few to no differences when compared with their cis peers in terms of psychological well-being. Similarly, in longitudinal studies from the Netherlands, youth who can access and use medical intervention, when desired and warranted, show marked reductions in compromised health indicators and gains in well-being. Thus, one clear set of strategies for promoting and fostering well-being among trans youth is to engage in behaviors that allow trans youth to self-disclose and live authentically in safe contexts.

Family Support and Acceptance

Family support is essential when considering the well-being of all youth, particularly trans youth. Growing empirical support finds that family support is a strong predictor of psychological and physical well-being for trans youth. Indeed, a growing number of studies find that when trans youth have safe and close relationships with their families, well-being is just as high as it is among cis youth. Aligned with this conclusion, other studies find that parental relationships are more strongly related to well-being than are relationships with peers or other family members. Further research is needed to distinguish between general family support and acceptance and gender-specific support and acceptance. Furthermore, research is needed that examines how family relationships change and fluctuate over time (before, during, and after disclosure) and how these changes relate to well-being. Even though this literature is still emerging, opportunities for prevention and intervention development to foster and support well-being among trans youth must include efforts to include and support family members, particularly parental figures.

Youth and Teens of Color

The 21st century has witnessed a massive rise in the cultural visibility of trans people, including trans youth and children, but this phenomenon has largely not included trans youth and teens of color. Within the broader dynamics of trans hypervisibility, trans youth have become the focus in political and media debates over access to health care, the regulation of the public sphere, the role of the state in regulating sex and gender, and in the perhaps limited or imagined progress of trans recognition and acceptance. For example, trans young people have found themselves at the center of debates over gender-segregated restrooms and organized sports, in part because the regulation of these systems in public schooling is taken for granted to a degree that is not always the case in settings for adults. At the same time, the widespread acknowledgment that children might be trans has prompted a massive increase in cultural and media representation of trans youth. Add to this the possibilities for youth self-representation through the Internet and social media and it seems that trans young people are more omnipresent in the public and media sphere than ever. This entry identifies the gaps in the history of trans visibility, medicalization, and law that have created barriers to trans youth and teens of color, before exploring their unique experiences and areas where more research is needed.

Trans as a Racially Unmarked Category

The dominant image of trans youth that most often appears in the global North is much whiter and richer than trans youth as a demographic whole in those countries. Given that Anglo-American and Western European representations of trans youth and teens are also the dominant ones exported globally, this disproportionate whiteness has an international reach. This particular vision of trans youth—one that is white and relatively affluent—presents itself as general or universal. The narratives attached to this image typically revolve around problems of family acceptance or rejection and access to rarefied and expensive pediatric health care in the form of puberty-suppressing medications. In reality, such a family-centric and medically oriented experience

is the exception, not the rule, for trans youth, many of whom face poverty, homelessness, and other vulnerabilities as primary in their trans experience. The dominant image of trans youth that revolves around gender in isolation, then, is a relative privilege of wealth and whiteness in the global North. As a result, trans youth are represented in the media as a much more conceptually white and racially unmarked category that they might otherwise be.

To begin to understand and recognize the lives of trans youth and teens of color, then, is to begin with a problem of how "trans" as a social and cultural category is frequently racially unmarked and so, by default in many countries in the global North, raced white. The descriptor "of color" is also largely American in origin and joins a growing subfield in trans studies: trans of color theory and critique. This umbrella term should not, therefore, be assumed to be applicable in a universal or globally encompassing sense. Trans of Color Studies is not a unified collection of thinking and writing, either, but it does share a common critical orientation. Rather than referring to a shared group identity, *trans of color* is more often used by scholars to specify and map complex but common patterns of racialized gender oppression unique to gender-nonconforming people who are racially marked.

In the United States, for example, centuries-old anti-Black and settler colonial practices of dispossession and genocide join more recent regimes of immigration-based, ethnic forms of state regulation, exploitation, and enforced competition. Trans people from various racialized, ethnic, and immigrant communities may find points of commonality and affiliation under these regimes of power and subjection, but also coercion and incommensurability, in their patterned experiences of oppression. Trans of Color Studies is also intersectional in scope and practice, drawing attention not only to how trans individuals and populations are affected by their membership in racial and ethnic minority communities but also to how racially unmarked categories like sex, gender, and transgender have their own deeply racialized histories and significance.

Trans Medicine, Youth, and Race

Although terms such as *trans* and *transgender* have emerged as nonmedical umbrella categories for identity, they also preserve a racial history from medical concepts like *transsexuality,* which bears down upon the lives of youth and teens of color in particular ways. People of color have frequently been judged to be not plastic enough in their gender to merit access to transition under the dominant paradigm of medicalization. The origins of this perception in the contemporary medical model for gender transition emerged in the mid-20th century, as European, American, and colonial medical researchers began to categorize the wide variety of requests to "change sex" under the new clinical language of "transsexualism." The medicalization of transition took on in this period the broad outlines of its current standards of care, which include hormone replacement therapy, social and legal transition, and gender-affirming surgeries. As these medical therapies were grouped together and offered as the prescribed treatment for transsexuality, clinicians also produced the first systematic standards by which trans people would be judged eligible or ineligible for access to medicine. The assumptions of that process reveal the ways in which trans medicine has been a racial project since its inception. The scientific and medical concept of being able to "transition" or "change sex" through hormones and surgeries relies greatly upon the thesis that gender is *plastic:* that is, open to changes in form as it grows during the developmentally sensitive periods of childhood and adolescence.

Since the beginning of the 20th century, a wide variety of European and American scientists had studied the supposed "sex differences" of different human cultures, which they viewed according to an older concept of race. These anthropologists, biologists, sexologists, and endocrinologists made a number of racist claims about the supposed difference in sexual anatomy and the degree of sexual differentiation between different "races" (as they saw them). In this way, a racist hierarchy of "civilization" that placed white Europeans at the apex was mapped onto sex and gender, codifying them as racial characteristics. One of the outcomes of this several decades of research was that malleability in the openness to change in sexual differentiation was associated most with the childhood and youth of white populations. Endocrinologists, who were working on a wide array of animal and human experiments with hormones, felt that the applications of this research might be eugenic,

improving the "racial stock" of white populations by providing for optimal hormonal levels during the critical stages of childhood and puberty. As a result of this longer history, even when the explicitly racist veneer of the life sciences was disavowed in the aftermath of World War II, many of the hormonal and surgical techniques that founded postwar trans medicine relied conceptually and technically upon the same principle of plasticity. When the first university gender clinics began to open in the United States and the transsexual medical model began to gain more widespread currency, it was often extremely difficult for trans people of color to gain access. When trans people of color did, in some instances, gain entry and work extensively with sexologists, psychiatrists, and endocrinologists, the resulting theories of trans development and gender often obscured the racial and ethnic identities of those patients, whitewashing the medical model even further. People of color still bore the stigmas of earlier scientific perceptions that their bodies were less plastic and, therefore, less able to successfully transition.

Legal and Cultural Barriers to Trans Youth of Color

In the specific case of trans youth and teens of color, forms of legal, economic, political, and social marginalization affecting young people beyond transness also come into play. In the United States, as in many other countries, people who are legally considered minors do not enjoy full civil rights, citizenship, or personhood. Legally barred from working to secure economic autonomy, without the right to vote, and subject through various legal means to the authority of parents, guardians, and other parent-like entities and institutions, trans youth face particular hardships that are often framed otherwise as "in the best interests" of children. The various means by which children are rendered dependent on adults magnify the vulnerability that trans youth and teens of color face in relation to adults who do not support, or outright reject, them. The medical age of consent, for example, in many jurisdictions effectively prevents trans youth from seeking gender-affirming forms of health care without the prior approval of parents, and local laws may make reaching out to other adults for help—such as school counselors, social workers, or teachers—entail the risk of being outed, a potentially dangerous outcome.

The legal principles of protection, guardianship, and coercive dependency that have formed around children and youth are also part of racialized political histories. In the United States, they were forged out of larger settler colonial projects that cast sovereign Indigenous nations as "domestic, dependent nations," as described by the Supreme Court in its pivotal 1832 decision *Worcester v. Georgia*. For two-spirit and other trans Indigenous youth, then, the denial of self-determination spans two simultaneous dimensions of the same logic of dependency but often considered separately. For Black and Latinx trans youth and teens in the United States, who already face disproportionate policing and overincarceration, as well as structural racial disparities in education and access to employment, the racial logics already targeting them may only be compounded through forms of surveillance, coercion, and violence that treat gender nonconformity as an accelerant to violence and confinement. For instance, while antibullying statutes passed in many states were originally conceived of as a means of protection for LGBTQ youth, in practice, they tend to magnify existing school-to-prison pipelines and disproportionately target youth of color, whose trans expression or gender nonconformity is often framed as disruptive, aggressive, and threatening.

Social scientific research has described what is called the "social determinants of health" for trans youth and teens of color. These determinants refer to the ways in which structural poverty, political oppression, and overexposure to violence by the state can perpetuate a legacy of inaccessibility to health and well-being, transforming the parameters of the question of health care otherwise associated with trans young people and rendering them invisible in the existing literature. As sociological work with Black, Indigenous, and trans of color youth in the United States and Canada also shows, the lives of young people are far more complex than have been represented in the media or are described through the lenses of discrimination and violence alone. Systems of peer support, familial resilience, and sense of community that are intersectional, and thus less uniquely focused on gender as a single axis, can be overlooked. Many trans youth of color may approach their life experiences

and the question of support from a stance grounded in racialized oppression and resilience in their broader community. More research that centers the voices and perspectives of trans youth of color can build a more complex fabric of knowledge and recognition. And, more research from the global South can continue to displace the dominance of U.S.-based models of race and intersectionality in this research.

Youth and teens of color remain marginal within the contemporary frame of trans hypervisibility. Their patterned systems of racial and ethnic oppression that compound forms of legal, economic, and social dependency complexify the dominant narrative and representation of trans youth and teens today, as well as remind us that the very categories of "trans" and "youth" benefit from critical, intersectional analysis that does not presume them to be racially unmarked categories of life and experience.

YouTube

YouTube is the world's most popular online video-sharing platform, with over 2 billion users each month and more than a billion hours of video watched every day, as of May 2020. Owned by Google, with headquarters in San Bruno, California, YouTube has local versions in more than 100 countries. YouTube has transformed the media landscape by allowing anyone with an Internet connection to freely distribute videos to mass audiences. Whereas trans people have often been the object of representations made by and for cis people, YouTube has enabled hundreds of thousands of trans people to create and distribute images of themselves on a global scale. Trans YouTubers post many genres of video and have also innovated trans-specific genres, like transition video blogs (vlogs). Some trans vloggers have capitalized on YouTube's Partner Program and sponsorship opportunities to become professional YouTube celebrities with millions of followers. However, trans YouTubers have also accused the company of policies that discriminate against LGBTQ content creators, and Google is currently the subject of a class-action lawsuit on these grounds. Trans scholars have also criticized transition vlogs for instituting impossible, non-representative ideals for trans bodies and reinstating existing social hierarchies. YouTube is also an essential platform for distributing other kinds of inventive trans-created media, such as drama and comedy web series, short documentaries, short fiction films, and music videos.

Trans people have to be creative in order to envision and enact their true selves and build worlds that will sustain them. Since the birth of the Internet, digital network technologies have been important to the development of trans communities, spreading new possibilities for trans identification and political action. As a group with comparatively less capital and less access to media training and equipment, trans people have especially benefited from the democratization of audiovisual and digital distribution technologies. Thus, YouTube has been particularly transformative for trans people. But the platform is not without its problems.

YouTube was launched in 2005. Already by 2006, trans people like Grishno/Erin Armstrong had started posting vlogs. In May 2020, a search for the word *transgender* on YouTube returned 4.2 million results. Searches for terms used more commonly by trans creators revealed 926,000 results for *trans vlog,* 641,000 results for *FTM* (female-to-male), 263,000 results for *MTF* (male-to-female), and 112,000 results for *nonbinary.* Trans YouTubers

create videos in many genres, including beauty and fashion, education, comedy, gaming, music and dance, pranks and challenges, animation, and how-to videos. Trans YouTubers have also innovated trans-specific YouTube genres—namely, transition vlogs, transition timeline videos, and transition time-lapse videos. As discussed in what follows, these types of videos document, construct, and analyze the process of social and often medical gender transition.

Trans-Specific Genres

In transition vlogs, also called video diaries, the subject usually sits in a private space (often a bedroom) with their head and torso visible and talks directly to a webcam or cell phone camera, giving the impression that they are directly addressing the viewer. While transition vlogs were initially characterized by low production values, some vloggers today invest in higher-grade production equipment. Most vloggers assume that they are addressing audiences of trans viewers like themselves, thus marking a tremendous difference from mainstream commercial media that assumes and prioritizes cisgender audiences. Vloggers describe and display the physical differences they have noticed due to their hormone regimes (and occasionally from surgery), talk through emotional aspects of transition, and give advice. Some vloggers post every day, while others only post every few months. The title of the vlogs often names the amount of time on T (testosterone) or HRT (hormone replacement therapy), thus using hormone regimes to establish a novel temporality that trans media scholar Laura Horak (2014) has called "hormone time" (p. 573).

In transition timeline videos, vloggers compile still photos chronologically, starting from their childhood or the beginning of their transition to the present day, often accompanied by explanatory on-screen text and inspiring instrumental, light electronica, or pop music. Timeline videos tend to narrativize transition as a linear progression from an unhappy, confused, and closeted beginning to a happy, out, and fully transitioned ending, often using metaphors of rebirth and sunrises and ending with affirming advice for those considering transition. A search for *transgender timeline* on YouTube in 2020 yielded 120,000 results. Transition time-lapse videos are a subgenre of the timeline video in which subjects take a photograph of themselves every day for years and use a program to assemble the photos into a seamless video in which their face and hair miraculously transform within minutes. A search for *transgender time lapse* on YouTube in 2020 returned 53,700 results. These three transition genres may have become popular because they exploit YouTube's penchant for the combination of the personal and the spectacular.

Problems With YouTube

While trans creators have flocked to YouTube, some have complained that its algorithms disadvantage LGBTQ creators. In March 2017, LGBTQ people began complaining that YouTube was flagging their videos as "restricted," thus automatically filtering them out of Internet searches in schools, libraries, and other settings that limit "adult content," even though the videos did not merit the rating. Although YouTube has repeatedly apologized and claimed to have fixed the problem, LGBTQ creators continue to experience these and other biases. In August 2019, Canadian trans YouTuber UpperCaseChase1/Chase Ross and other LGBTQ YouTubers filed a class-action lawsuit alleging that YouTube continues to flag their videos as "restricted" without merit, thus lowering their potential audiences and removing the possibility of earning revenue from ads that precede the videos. They also claimed that YouTube excludes LGBTQ content from the "Up Next" recommendation sidebar and regularly plays anti-LGBTQ ads immediately before and after LGBTQ videos. Google filed a motion to dismiss the lawsuit in February 2020, but the case has not been resolved as of May 2020.

YouTube and Transnormativity

YouTube allows a wide diversity of trans people, such as Black trans porn entrepreneur Ts Madison, Pakistani American teenager Achilles Krishna/Krishna K, "hispanic nerdy chill gamer poly queer trans girl in a wheelchair" Kaley Kutie, and nonbinary provocateur Milo Stewart, to circulate media content that does not conform to the transnormative politics of respectability that ordinarily determines which trans people are invited into the mainstream media. At the same time, the trans

YouTubers with the most views and subscribers tend to be white, traditionally gendered, conventionally attractive, medically transitioned (or transitioning), and of comfortable means, thus reinforcing existing social hierarchies. YouTube's ranking algorithms make it harder to find YouTubers who deviate from these norms. Thus, while starting as a DIY alternative to mainstream media, trans-made YouTube videos may be instating uncomfortable new norms of what trans bodies should look and sound like. Trans and intersex studies scholar Hil Malatino (2019) describes transition vlogs as a form of "cruel optimism" (p. 636) whose promise of utopian posttransition happiness in fact makes it harder to survive in the present, when transition may not be possible or even desired. Furthermore, researchers training artificial intelligence systems to recognize human faces have taken images from YouTube transition videos without permission in order to help their system recognize faces before and after HRT.

Trans Professional YouTubers

In the 2010s, some trans YouTubers managed to become professional YouTube celebrities and have been able to make a living through a combination of YouTube ad revenue, sponsorship deals, product reviews, speakers' fees, and Patreon donations. The trans YouTubers with the most subscribers are conventionally attractive trans women beauty vloggers: NikkiTutorials/Nikkie de Jager (more than 13 million subscribers as of May 2020), a white Dutch trans woman who was forcibly outed in January 2020; Gigi Gorgeous (nearly 3 million subscribers), a white U.S. trans woman who started creating makeup videos in high school years before coming out as trans; and Nikita Dragun (2.75 million subscribers), a Belgian-born Asian-Latinx U.S. trans woman who also started making videos in high school 2 years before coming out as trans. MilesChronicles/Miles McKenna (more than a million subscribers) is the most popular among a group of young white trans men in the United States and United Kingdom who are known for their transition vlogs. ContraPoints/Natalie Wynn and Blaire White (both with more than 900,000 subscribers) are white U.S. trans women political vloggers on opposite ends of the ideological spectrum. Wynn is a leftist who posts stylish 20- to 40-minute video essays on topics ranging from "Incels" to "Opulence," while Blaire is a right-wing Donald Trump supporter who posts self-described "rants" criticizing individual trans people and trans politics more generally. Among the most popular nonbinary bloggers are MilesJaiProductions/Miles Jai, a Black nonbinary trans femme who posts a wide range of hair and makeup tutorials, sketches, parodies, vlogs, and music videos, and Ash Hardell, a white YouTuber from Minnesota who posts vlogs and educational videos.

The documentary *This Is Everything: Gigi Gorgeous* (2017), directed by Academy Award–winning documentary filmmaker Barbara Kopple and produced by YouTube Red, presents the life of an up-and-coming YouTuber as a thrilling fulfillment of the American dream. Gorgeous's self-actualization through facial feminization and breast surgeries is paralleled with her rising fame, income, and entry into modeling. In contrast, Wynn's feature-length video essay *Canceling* (2020) presents the negative side of trans YouTube fame, exploring Wynn's experience of being "canceled" by many trans Twitter and YouTube users after she cast controversial trans porn star Buck Angel as a voice actor in one of her videos.

Trans-Made Films and Web Series

YouTube has also become an important distribution platform for other kinds of trans-made content. The 2010s witnessed a wave of independently produced trans-made drama and comedy web series distributed on YouTube, from *Her Story* (2015) and *Eden's Garden* (2015) to the recently released *Razor Tongue* (2019) and *These Thems* (2020). YouTube has also become a new way to distribute an established trans film genre—the short documentary. Key examples include the historical educational shorts series *We've Been Around* (2016), interview-based educational shorts in the U.K.-based series *My Genderation* (2013–2020), and prison abolitionist activist shorts *Survived & Punished* (2018). Although many trans filmmakers distribute their short fiction films on Vimeo, some are also using YouTube, including Raven Davis (*It's Not Your Fault,* 2015), Rain Valdez (*If Trans Women Flirted Like Cis Men,* 2016), and Jana Bringlöv Ekspong (*@janabringlove,* 2018). YouTube is also a popular platform for music videos from

trans artists such as Shea Diamond, Laura Jane Grace, Anohni, Skylar Kergil, Star Amerasu, Laith Ashley, Shawnee, and Ryan Cassata.

Future Possibilities

Looking toward the future, YouTube seems like a permanent fixture in the trans media landscape. Trans-made YouTube videos will likely be one of the first sources of information young trans people encounter when they start wondering what it means to be trans. Transition vlog genre conventions have remained fairly stable since 2006 and seem likely to stay that way. On the whole, trans YouTube videos may continue to shift from amateur to professional approaches, as YouTube encourages its creators to professionalize through free online tutorials (YouTube Creator Academy) and in-person studios for creators who have more than 10,000 subscribers (YouTube Space) in cities such as Los Angeles, New York, Berlin, Rio, and Tokyo. While there are likely to be increasing numbers of trans YouTube celebrities, the proliferation of content, search algorithms that prioritize popularity, and YouTubers' increasing use of agents and publicists will likely make it harder and harder to break in. Indeed, in the future, YouTube may start to look more and more like more traditional media industries.

Archives

These collections are the most noteworthy for supporting research in trans studies.

Digital Transgender Archives (DTA)

https://www.digitaltransgenderarchive.net/

Based at Northeastern University, the DTA has digitized trans resources for many other collections, thereby making this material widely available online.

National Transgender Library and Archives

https://guides.lib.umich.edu/c.php?g=282858&p=1884819

Housed at the University of Michigan, the collection includes a wide range of trans resources.

OutHistory.org

A website on LGBTQ history that includes articles and resources on trans history.

Queer Digital History Project

https://queerdigital.com/

A website that documents pre-2010 LGBTQ digital spaces online. It includes an archive of trans-related Usenet newsgroups and interactive maps of TGNet, one of the first international trans-specific BBS networks.

Transgender Archives

https://www.uvic.ca/transgenderarchives

Housed at the University of Victoria, the Transgender Archives is the world's largest trans archive. It includes the Reed Erickson collection, the University of Ulster's Transgender Archive, the

records of Fantasia Fair and the International Foundation for Gender Education, and issues of *Transgender Tapestry* and *Transvestia*.

Journals

These journals are the leading sources for research in trans studies.

International Journal of Transgender Health

https://www.tandfonline.com/action/journalInformation?journalCode=wijt21

The journal of the World Professional Association for Transgender Health (WPATH), the *International Journal of Transgender Health* (formerly known as the *International Journal of Transgenderism*) offers a multidisciplinary approach to research in trans health.

Journal of LGBT Youth

https://www.tandfonline.com/loi/wjly20

The journal is an international, interdisciplinary research forum dedicated to improving the quality of life for LGBTQIA+ and allied youth.

Psychology of Sexual Orientation and Gender Diversity

https://www.apa.org/pubs/journals/sgd

The journal is a publication of the Society for the Psychology of Sexual Orientation and Gender Diversity, a division of the American Psychological Association.

Transgender Health

https://home.liebertpub.com/publications/transgender-health/634

The journal addresses the health care needs of trans people over their life spans and prioritizes scholarship in areas where policy development and research are needed to achieve health care equity.

TSQ: Transgender Studies Quarterly

https://read.dukeupress.edu/tsq

TSQ publishes interdisciplinary work on the diversity of gender, sex, sexuality, embodiment, and identity.

Websites

Each of these websites was used as a resource for multiple encyclopedia entries.

International Pronouns Day

https://pronounsday.org

This site provides information not only about the annual event (held on the third Wednesday of October) but also about the importance of sharing and respecting pronouns.

Trans Advocate

https://www.transadvocate.com

Focused on the intersections between trans and feminism, the site includes the Conversations Project, a collection of interviews and other material on the trans-inclusive history of radical feminism.

Transgender Day of Remembrance

https://tdor.info

This site provides information about individuals killed each year because of their gender identity.

Trans Policy Clearinghouse

https://www.campuspride.org/tpc

Sponsored by Campus Pride, this site tracks trans-inclusive policies at U.S. colleges and universities.

Supplementary References

This bibliography supplements the lists of readings that appear at the end of individual entries in the main encyclopedia, organized by topic.
